7a In United States District Court for the District of Oregon

In equity

OREGON-WASHINGTON RAILROAD & NAVIGATION COMPANY, PETITIONER

vs.

THE UNITED STATES OF AMERICA, DEFENDANT

Petition

Filed May 28, 1930

To the Honorable Judges of the District Court of the United States for the District of Oregon:

Your petitioner, Oregon-Washington Railroad & Navigation Company, an Oregon corporation, files this, its petition, against the United States of America to enjoin, set aside, and annul an order, hereinafter set forth, of the Interstate Commerce Commission (hereinafter called the "Commerce Commission"), a commission existing under and by virtue of the interstate commerce act, and thereupon your petitioner complains and says:

Article I. Residence and status of petitioner

1. That your petitioner is and since November, 1910, has been a corporation organized and existing under the laws of the State of Oregon, owning and operating railroad properties in the States of Oregon, Washington, and Idaho, consisting of main lines extending—

(a) From Portland, Oregon, via Messner and Umatilla to Huntington, Oregon;

(b) From Portland, Oregon, to Spokane, Washington; and

(c) From Portland, Oregon (by trackage owned and leased), to Tacoma and Seattle, Washington.

and of numerous and extensive branch lines of railroad springing from said main line tracks and penetrating into and serving tributary territory, one of which branches, commonly known as the Des Chutes branch, extending southerly from a junction with petitioner's main line on the south bank of the Columbia River in Oregon

8a at a station known as Sherman via the canyon of the Deschutes River to Bend, Oregon, a distance of 147 miles, petitioner has operated and does now operate under a lease from Des Chutes Railroad Company and under a joint user trackage contract from Oregon Trunk Railway.

2. For many years last past petitioner has owned and does now own a line of railroad 155.3 miles in length, extending from a connection with the railroad of Oregon Short Line Railroad Company at Ontario, Oregon, via the Malheur Canyon to Crane, in Harney County, Oregon, and thence across the Harney Valley to Burns.

Oregon. From 1916 to 1924 said line terminated at Crane, 125 miles from Ontario, but in said year 1924 was extended to Burns, which point has since been and is its actual and designated terminus. During all of said times said line has been continuously operated by Oregon Short Line Railroad Company under lease from petitioner.

Article II. Venue—Entry of Commerce Commission order

3. That the Public Service Commission of Oregon (herein referred to as the "Oregon Commission") is now and has been for many years last past a commission created and existing under and by virtue of the laws of the State of Oregon, and charged by the laws of said State with certain duties with respect to the regulation of railroads and public utilities in their operations within the State of Oregon; that said Oregon Commission consists of three commissioners each of whom is a citizen, resident, and inhabitant of the State of Oregon, and that the location, office, and place of business of said Oregon Commission is in the city of Salem in the State of Oregon.

4. That on the 24th day of May, 1927, said Oregon Commission filed its complaint with the said Commerce Commission against the following named railway corporations as defendants therein, to wit:

Central Pacific Railway Company;
Des Chutes Railroad Company;
Great Northern Railway Company;
Northern Pacific Railway Company;
Oregon Electric Railway Company;
Oregon Short Line Railroad Company;
Oregon Trunk Railway;
Oregon-Washington Railroad & Navigation Company;
9a Southern Pacific Company;
Spokane, Portland & Seattle Railway Company;
Union Pacific Railroad Company;

and in and by said complaint said Oregon Commission prayed for an order from said Commerce Commission requiring one or more of said defendants to construct a line of railroad between Crane or Harriman, Oregon, on the east, and Crescent Lake or some adjacent point on the line operated by the Southern Pacific Company, on the west; that said cause before said Commerce Commission was and is known as docket No. 19680, and a copy of said complaint in said cause is hereto attached marked "Exhibit A" and made a part of this petition. That thereafter the defendants in said cause, including this petitioner, filed with said Commerce Commission their answers to said complaint and thereby denied and placed in issue all of the allegations of said complaint except those respecting formal matters, and by affirmative answers presented defenses including the constitutional objections hereinafter mentioned. That said cause was heard before said Commerce Commission and thereafter and on

the 3rd day of December, 1929, said Commerce Commission made and entered its report and order in said cause by the terms of which order this petitioner was and is required to commence on or before July 1, 1930, the construction of 185 miles of railroad (referred to herein as "cross-State line") through central Oregon from a point on petitioner's Ontario-Burns line of railroad to a connection with the Cascade line of Southern Pacific Company at or near Crescent Lake, Oregon, and to complete and place same in operation before July 1, 1933; that thereafter, and on or about the 13th day of December, 1929, said order was served upon petitioner and is the order sought to be enjoined, set aside, and annulled in this proceeding; that said order, together with the said report of the majority of said Commerce Commission and the dissenting reports therein, have been officially published by said Commerce Commission in volume 159, Interstate Commerce Commission Reports, at pages 630, et seq., and a copy of said reports and order are hereto attached marked "Exhibit B" and made a part of this petition. That petitioner will produce upon the hearing of this cause a full transcript of the evidence adduced on the hearing of said cause, docket No. 19680, before said Commerce Commission and prays your honors that the same be considered in support of this petition.

10a Article III. Jurisdiction of court

5. This suit is brought to enjoin, set aside, and annul said order of the Commerce Commission and involves a controversy arising under the Constitution and laws of the United States, and the jurisdiction of this court is invoked under subdivisions 1, 8, and 28 of section 41, and sections 45 to 48, inclusive, of chapter 2 of title 28 of the Code of Laws of the United States of America (44 Stat. L., part 1, pages 866 to 870, inclusive) as amended and supplemented by Supplement III of said Code of Laws of the United States of America (pages 291 and 292).

Article IV. Oregon areas and physical features

6. That the State of Oregon has an area of 96,699 square miles, with a coast line of 278 miles, from which it extends to the east for a distance of approximately 395 miles; substantially parallel with and about 100 miles easterly from said coast line the Cascade Mountains cross said State in an unbroken range from north to south; said mountain range through the State has an average elevation of some 7,000 feet, with certain peaks in excess of 10,000 feet; along the coast line the State is crossed in a general northerly and southerly direction by the Coast Range of mountains, with a maximum altitude of about 4,000 feet: between the Coast Range and Cascade Range of mountains lies the Willamette valley, and in the southwestern section of the State between these mountain ranges are valleys of much more limited areas, known as the Umpqua and the

Rogue. That part of the State west of the summit of the Cascade Range of mountains is known as western Oregon.

7. That part of the State east of the summit of the Cascade Range of mountains is generally known as eastern Oregon and comprises approximately two-thirds of the area of the State. Eastern Oregon in general is a plateau region, with a rolling, broken, and uneven surface in the south half thereof, and a more mountainous contour in the north half thereof; of the more important mountainous elevations in question is a range commencing a few miles east of a point in the Deschutes River canyon where Crooked River joins the Deschutes, and proceeding in a general easterly direction with increasing elevation it forms a spur of the Blue Mountain Range, which proceeds northeasterly from a point some 20 miles north of Burns and thence along the eastern part of Oregon
11a and across its northern boundary; said Blue Mountain Range, in the northeastern part of the State, is followed southerly along the easterly boundary of Oregon by the Burnt River Mountains, the Cedar Mountains, and the Stein's Mountains.

8. That except for limited areas in Malheur County and in the Harney Valley, and very limited areas in southwestern and western Lake County and in the Klamath Basin, which excepted areas are now accessible to and served by existing lines of railroad, and except the timbered areas on the eastern slope of the Cascade Range and in southwestern Lake County (which timbered areas, including those within national forest reserves and Klamath Indian Reservation, contain together approximately 50 billion feet of timber), the southern half of eastern Oregon is almost in its entirety a high desert country, commonly known as the "Great High Desert" and officially described as the "Great Sandy Desert," and same is almost entirely without living water and with no known and practicable available source whereby living water in substantial quantity can be obtained; said desert area comprises many millions of acres in extent and is not adapted or suitable for settlement, reclamation, or cultivation; that the annual rainfall throughout said section is less than 10 inches, and with respect to a substantial part of said area killing frosts obtain in every month of the year; that along the entire route of said proposed railroad and for a distance of 50 miles on either side of it there is no town or settlement except the town of Burns with a population of 200 people.

Article V. Southern Pacific lines and traffic originating thereon

9. That during all the times herein mentioned the Southern Pacific Company was and is a corporation organized and existing under the laws of the State of Kentucky, engaged pursuant to its charter powers in operating railways in the State of Oregon and in other States and among the States of the United States, and having operating offices at Portlend, Oregon, and its principal oper-

ating office at San Francisco, California. That of the lines of railroad operated by it as aforesaid, there have been and are among others:

(a) A main line from Portland, Oregon, via Eugene and Ashland, to Oakland and San Francisco, California, and a second main line known as the "Cascade line" from Portland to Oakland and San Francisco, via Eugene and Klamath Falls;

12a (b) A main line from Oakland, California, via Sacramento, California, to Ogden, Utah;

(c) A main line route from western Oregon via said route (a) connecting with route (b) at Roseville, California, and proceeding thence to Ogden, Utah; and

that physical connection and interchange facilities have during all of said times and do obtain at Portland, Oregon, between said Southern Pacific lines on the one hand and the lines of your petitioner and the Northern Pacific Railway Company, Great Northern Railway Company, and the Spokane, Portland and Seattle Railway Company, respectively, on the other, and between the Southern Pacific Company's line and the line of the Union Pacific Railroad Company at Ogden, Utah, and by means thereof through business has been and is currently interchanged and transported by and between said connecting carriers; that during all of said times said Southern Pacific Company has and does control and operate as a part of its railway system in the State of Oregon numerous and extensive branch and feeder lines of railway connecting with its main lines in said State.

10. Except at and in the immediate vicinity of Portland, in which area competitive conditions obtain between the lines of your petitioner, of the Southern Pacific Company and of the northern lines hereinafter described, and except in Columbia and Clatsop Counties, wherein rail transportation service is afforded by lines of railroad operated by the said northern lines, railroad traffic in western Oregon originates for the most part on the railroad lines of said Southern Pacific Company, and said company is the initial carrier with respect to same, and, with said exceptions, the Southern Pacific Company is for the most part of necessity the delivering carrier as to railroad traffic moving to destinations in western Oregon; that the Oregon lines of said company consist of more than 1,400 miles operated, with a capital investment therein of approximately $150,000,000, and the operations of said Oregon lines for several years last past have resulted in a net return on the investment therein of less than 1 per cent per annum; that upon the trial of said cause before said Commerce Commission the year 1926 was agreed upon by all of the parties to said proceeding as representative of the operations of said Southern Pacific lines in Oregon; that during said year 1926 there were originated on said lines in Oregon 183,478 carloads of traffic, including shipments for both intrastate and interstate movement; of that number 151,876 carloads, or 82.7 per cent of

13a the total, consisted of forest products; 11,555 carloads, or 6.3 per cent, consisted of agricultural products; 3,644 carloads, or 2 per cent, consisted of animals and animal products; 12,096 carloads, or 6.6 per cent, consisted of miscellaneous and manufactured products; and 4,346 carloads, or 2.4 per cent, were products of mines, consisting for the most part of gravel and rock for highway construction; of said total carloads originated as aforesaid 150,180, or 82 per cent of the total, moved locally to destination points on Southern Pacific Company lines or to points on connecting lines in territories that would not be reached by the proposed cross-State line involved herein. That upon said hearing before said Commerce Commission complainant classified as transcontinental all Oregon traffic, both east and west bound, originating with Southern Pacific lines in Oregon or received by said lines, destined to or originating in territory east of the Oregon-Idaho or of the Washington-Idaho State boundary line or beyond the Nevada-Utah boundary line or to the south of the boundary line between New Mexico and Texas; that the total of said transcontinental traffic for said year 1926 via all routes and gateways amounted to 37,386 carloads, or 1,093,485 tons, of which 82.26 per cent consisted of forest products, 8.28 per cent consisted of agricultural products, 7.23 per cent consisted of miscellaneous and manufactured products, 2.18 per cent consisted of the products of mines, and .05 per cent consisted of livestock; of this traffic 33,434 cars (or 89.43 per cent) of the carloads and 1,008,174 tons (or 92.2 per cent of the tonnage) moved eastbound, but only 3,952 cars (or 10.57 per cent) of the carloads and 85,284 tons (or 7.8 per cent of the tonnage) moved westbound; that of said total 37,386 carloads, 5,710 cars originated or were received in Klamath County, and of said Klamath County traffic 5,364 cars originated in the county and moved east, while 346 cars originated in the east and were received in said county, and the balance of said total of 37,386 carloads, or 31,676 cars, originated and were received in western Oregon, divided 27,070 cars originating in western Oregon and moving east and 3,606 cars received in western Oregon from the east; that of the said 27,070 cars originating in western Oregon and moving east, 14,516 cars originated in the counties of Tillamook, Washington, Multnomah, Clackamas, Yamhill, Marion, and Polk, and the distance from the shipping points in said several counties to the common eastern point of Granger, Wyoming, is shorter via the Portland gateway and the line of your petitioner through Huntington, Oregon, than via the proposed cross-State line, with considerations of service, speed, facilities, economy, and efficiency, all favoring
14a said existing route via Portland.

11. That of the railroad mileage operated by said Southern Pacific Company in Oregon, California, and Utah, as aforesaid, a substantial part thereof has been during the times herein referred to and is now owned by the Central Pacific Railway Company, a corporation organized and existing under and by virtue of the laws

of the State of Utah; that said Central Pacific Railroad mileage is and has been during said times under lease to said Southern Pacific Company; that of said Central Pacific owned lines in Oregon there was during and prior to the year 1923 a line extending from a connection with the Southern Pacific Company's railroad at Natron, Oregon, near Eugene, in a southeasterly direction to Oakridge, a distance of 34 miles, and another line extending from a connection with the Southern Pacific operated at Weed, California, in a northerly direction 127 miles to Kirk; that in the years 1923 to 1926 said Central Pacific Railway Company constructed its railroad connecting said two lines between Oakridge and Kirk, and in order to improve said line between Natron and its connection at Weed, California, said company constructed as a part of said main line a railroad from a point 4 miles south of Weed Station in a general northeasterly direction to a point on its said Klamath Falls line near Grass Station, all in Siskiyou County, California, and said line was promptly placed in operation and during all of said times has been and is now operated by said Southern Pacific Company under said lease as aforesaid; that one of the principal inducing causes for the construction of said line of railroad from Natron though Klamath Falls to said point of connection south of Weed was to secure to said Southern Pacific Company for operation between Oregon and California points an alternate main line with lighter grades and less curvature and distance than obtained on the said first main line of the Southern Pacific Company above described, and also to enable said Southern Pacific Company to more efficiently and economically handle and transport through western Oregon traffic with California and with the East through the Ogden interchange with the Union Pacific Railroad Company, and to encompass and enjoy the vast timber resources on the Cascade Range of mountains and on the easterly slope of same; that said Natron-Klamath Falls-Weed line has been commonly known as the "Natron cut-off" and is now more generally designated as the "Cascade line"; that said line crosses the summit of the Cascade Range of mountains through a tunnel at an elevation of 4,840 feet at a short distance from
15a Crescent Lake and as it then proceeds easterly and southerly it skirts the shore of said lake.

12. That pursuant to authority granted to it by the Commerce Commission in May, 1926, said Southern Pacific Company thereupon acquired control of the capital stock of the Nevada-California-Oregon Railway, a corporation owning and operating a narrow-gauge line of railroad from Lakeview, Oregon, to a connection with the Central Pacific Railway Company's line of railroad at Wendel, California, and concurrently with the said acquisition of said control by the Southern Pacific Company the Central Pacific Railway Company obtained authority from the said Commerce Commission to construct and operate a line of railway from a connection with its said Natron cut-off at Klamath Falls to a connection

with said Nevada-California-Oregon Railway line at Alturas in northern California, a distance of 98 miles, and pursuant to said authority received by said Central Pacific Railway Company in May, 1926, it proceeded to and did construct said line of railroad from Klamath Falls to Alturas at a cost of approximately $6,000,000, and in the meantime and prior to the making of the order of the Commerce Commission herein complained of, said Southern Pacific Company reconstructed said line of railroad of said Nevada-California-Oregon Railway and standardized the gauge of same between Lakeview, Oregon, and Wendel, California, and connected said Nevada-California-Oregon Railway with said Klamath Falls-Alturas line of railroad at Alturas at a cost of approximately $2,400,000; that prior to said construction of said Klamath Falls-Alturas railroad line and the reconstruction of said Lakeview-Wendel railroad line and since the year 1913, railroad traffic between points Ogden and east and western Oregon originating at or destined to points on Southern Pacific lines in western Oregon or lines tributary thereto was routed by said Southern Pacific Company through Roseville, California, and the principal consideration inducing said Southern Pacific to cause the construction of said Klamath Falls-Alturas line and the acquisition and reconstruction of the Lakeview-Wendel line was to obtain a more direct, efficient, and economical route for the handling of said transcontinental western Oregon business than the route afforded via Roseville, all of which said Commerce Commission recognized and acted upon in granting authority to said Central Pacific Railway Company and said Southern Pacific Company for the acquisition of said control of said Nevada-California-Oregon Railway and for the construction of said Klamath Falls-Alturas line and the reconstruction of said Nevada-California-Oregon
16a Railway line, and that the route afforded by said Southern Pacific Company for said transcontinental business between western Oregon and points Ogden and east via said Natron cut-off, Klamath Falls, Alturas, Wendel, and Ogden line is a direct and efficient route and is not unreasonably long as compared with the route via the proposed cross-State line between western Oregon points and eastern points, and that shipments moving via said existing route between western Oregon and eastern points move on a schedule as favorable and expeditious as could be afforded by the proposed cross-State line.

13. That prior to the year 1913 the traffic classified herein as transcontinental as aforesaid between Southern Pacific points in western Oregon and eastern points was transported by said Southern Pacific Company and the petitioner and its connections through said Portland gateway, because during said period prior to 1913 the line of petitioner and the said Southern Pacific lines in Oregon were under common control and management, but in the year 1913 petitioner's management ceased to have any control or direction of the operations of said Southern Pacific Lines in Oregon and progressively since that

time said transcontinental traffic has moved under the control and direction of said Southern Pacific Company via Roseville and later via Alturas and Ogden, and thereupon has been diverted from the railroad of your petitioner, with the result that petitioner has lost nearly all of said western Oregon transcontinental business and the volume thereof moving through the Portland gateway is very small; that the policy of the Southern Pacific Company has been, is, and will continue to be to retain the long haul on said traffic to its own rails wherever possible, and with respect to eastbound traffic originating on said Southern Pacific line in western Oregon said Southern Pacific Company has routed and will continue to route said traffic through Alturas as against the Portland gateway, for that its officers and agents occupy the originating territory and control the empty-car supply to shippers, and the western Oregon shippers originating the great bulk in both volume and revenue of said shipments from western Oregon testified in said cause before said Commerce Commission that it was and will continue to be their purpose and determination to continue favoring said Southern Pacific Company with said long haul irrespective of whether said cross-State line is constructed and placed in operation or not; that petitioner will be unable to divert any substantial portion of said western Oregon business to said proposed cross-State line if same is built and placed in operation.

17a

Article VI. Water carriers

14. That for more than ten years last past, a very large volume of the Oregon traffic, and particularly traffic originating in western Oregon and destined thereto, has been moving in increasing volume both to and from Pacific coast points and also to and from Atlantic coast and Gulf points via ships operated to and from Portland in the coastwise trade and via the Panama Canal, and as regards lumber and other forest products this has been and is the condition with respect to business originating at and tributary to Coos Bay, Oregon, and there is no reasonable prospect for the railroads in said territory or any of them to recapture any substantial part of said water-borne business.

Article VII. The northern lines

15. That during all of the times herein mentioned the Great Northern Railway Company was and is a corporation organized under the laws of the State of Minnesota and engaged in the operation as a common carrier of passengers and property by railroad between Mississippi River points at St. Paul and Minneapolis on the east and the ports on Puget Sound, Washington, on the west and intervening territory, and by trackage rights enjoyed by it a line of railroad from Tacoma, Washington, to Portland, Oregon, and from Spokane and Vancouver, Washington, to Bend, Oregon, via Fallbridge, Washington, from which last-mentioned point it operates

over the line of the Oregon Trunk Railway to Bend, and thence in part by its own line and in part by trackage rights acquired from the Central Pacific Railway Company and an interest in an intervening railroad to Klamath Falls, Oregon; that said last-mentioned extension from Bend to Klamath Falls traverses longitudinally the easterly slope of the Cascade Range of mountains until it reaches a point on said Natron cut-off of said Central Pacific-Southern Pacific Railway at a point called Chemult, from which point it operates by trackage rights over said Natron cut-off southerly to Klamath Falls.

16. That the Northern Pacific Railway Company is a corporation organized under the laws of the State of Wisconsin, and is and during all the times herein mentioned has been a common carrier by railroad engaged in the transportation of passengers and property between the Mississippi River at St. Paul and Minneapolis on
18a the east and the ports on Puget Sound on the west, and thence southerly to Portland, Oregon.

17. That during all of said times the Spokane, Portland and Seattle Railway Company has been and is a corporation organized under the laws of the State of Washington as a common carrier by railroad, and engaged in the transportation of passengers and property by its own line between Portland, Oregon, and Spokane, Washington, and between Portland and Astoria in the State of Oregon; that during its entire corporate existence the ownership of its capital stock, except trustees' qualifying shares therein, has been and is vested one-half in said Great Northern Railway Company and one-half in the said Northern Pacific Railway Company.

18. That since about the year 1912 the Oregon Trunk Railway has been and is a corporation organized and existing under and by virtue of the laws of the State of Washington, engaged as a common carrier by railroad of passengers and property from a connection with the railroad of the said Spokane, Portland and Seattle Railway Company at Fallbridge, Washington, via the canyon of the Deschutes River, to Bend, Oregon, a distance of 152 miles; that all of the capital stock of said corporation, except qualifying shares held by its board of trustees, is owned by said Spokane, Portland and Seattle Railway Company.

19. That the operations of said Great Northern Railway Company from Vancouver and from Spokane via Fallbridge and Bend to Klamath Falls commenced about the month of May in the year 1928.

20. That during all the times herein mentioned the Oregon Electric Railway has been and is a corporation organized and existing under and by virtue of the laws of the State of Oregon, engaged as a common carrier by railroad of passengers and property between Portland and Eugene in said State, with certain branch lines extending from said main line into tributary territory; but that all of its capital stock, except qualifying shares held by members of its board of directors, has been and is owned by said Spokane, Portland and Seattle Railway Company.

21. That each and all of said corporations classified herein under said heading "The northern lines" have such physical connections with each other that they carry on and conduct interstate commerce by railroad between said points in Oregon and points in other States of the United States and in foreign countries under through routes and joint rates, fares, and charges duly established, published,
19a and filed with said Interstate Commerce Commission and each and all of said railroad companies during all of said times have been and are subject to the said interstate commerce act.

Article VIII. The Des Chutes lines

22. That of the railroad mileage in the Deschutes River Canyon between the mouth of the Deschutes River and Bend, Oregon, the Oregon Trunk Railway operates by trackage rights from the Des Chutes Railroad Company between South Junction and Metolius, a distance of 24.3 miles, and your petitioner, by virtue of trackage rights from the Oregon Trunk Railway, operates over the tracks of the latter between North Junction and South Junction, a distance of 10.4 miles, and between Metolius and Bend, a distance of 41.3 miles; that the cost to the Oregon Trunk Railway of said railroad to Bend and its investment therein exceeds the sum of $15,000,000, and the cost to the Des Chutes Railroad Company of its said railroad line (95.3 miles) and its investment therein was and is $6,477,129.

23. That said two lines of railway serve the country on either side of said Deschutes River in the counties of Deschutes, Crook, Jefferson, Wasco, Wheeler, and Sherman; that the traffic forwarded from said lines greatly exceeds the traffic received thereon, and the traffic moving local to said lines has been and is almost negligible; that lumber manufactured and originating at Bend, where two large modern saw mills produce about 8,000 carloads of pine lumber per year, constitutes by far the largest traffic enjoyed by said lines; that moderately substantial shipments of wheat, hay, and livestock are received and transported over the same from said territory tributary to them; that said lines have been operated for eighteen years last past and said operations have been and are consistently attended with large operating deficits each year and afford no return to the owners of said lines upon their investment therein; that the principal towns and cities tributary to said Des Chutes lines and the population thereof, according to the Federal census of 1920, have been and are Bend, population 5,415, Redmond, population 585, Madras, population 337, and Prineville, population 1,144.

Article IX. Oregon, California & Eastern Railway

24. That the Oregon, California & Eastern Railway Company is and for more than ten years last past has been a corporation
20a organized under and by virtue of the laws of the State of Nevada as a common carrier by railroad of freight and pas-

sengers for hire, subject to the interstate commerce act, with its operating office at Klamath Falls, Oregon; that the property owned and operated by it consists of a line of railroad extending some 40 miles, more or less, from Klamath Falls easterly and northeasterly to Sprague River in said Klamath County, with an extension projected some 63 miles from its present terminus to Silver Lake in Lake County, Oregon, and with branch lines projected therefrom as follows:

(a) From a point on the proposed Silver Lake extension approximately 20 miles north of Sprague River northwesterly along the Williamson River approximately fifteen miles in Klamath County, Oregon; and

(b) From Sprague River southeasterly approximately 65 miles to Lakeview.

25. That said line, to the extent it has been constructed and operated, is and will be largely devoted to the transportation of logs from the timbered areas reached and traversed by said lines to Klamath Falls for manufacture into lumber, and also to afford transportation to saw mill operations to the extent such become established and accessible to said railroad, and to afford rail transportation service between Klamath Falls and Lakeview; that the purpose of said railroad has been and is to serve said timbered areas and that the same as projected passes through forested areas, and the extension to Silver Lake proceeds through a timbered tract and terminates in an open country utilizable for pasturage; that the operations of said railroad have not been profitable and can not be profitable in and of themselves as a separately operated property.

26. That upon application by said Oregon, California & Eastern Railway Company, the Commerce Commission in May, 1926, authorized the said construction applied for by said railway company as aforesaid, but conditioned same upon the granting by said Oregon, California & Eastern Railway Company to the said Oregon Trunk Railway Company of the right to operate over the railroad of said Oregon, California & Eastern Railway Company, but thereafter by authority of the Commerce Commission granted in January, 1928, joint control of said Oregon, California & Eastern Railway Company was acquired by the said Southern Pacific Company and the said Great Northern Railway Company by purchase of the capital stock of said Oregon, California & Eastern Railway Company, and said joint control of said property has been ever since and now is enjoyed by said purchasing railway companies.

21a Article X. Railroads comprising Union Pacific system

27. That the Union Pacific Railroad Company, Oregon Short Line Railroad Company, Oregon-Washington Railroad & Navigation Company, and Los Angeles & Salt Lake Railroad Company were during the times herein mentioned and are now separate corpora-

tions, and each of them operates as a common carrier by railroad subject to the provisions of the interstate commerce act (under and pursuant to which each of them reports to the said Commerce Commission as required by law), with principal operating offices respectively located as follows:

Union Pacific Railroad Company, Omaha, Nebraska;

Oregon Short Line Railroad Company, Salt Lake City, Utah;

Los Angeles & Salt Lake Railroad Company, Los Angeles, California;

Oregon-Washington Railroad & Navigation Company, Portland, Oregon;

but the said four companies together constitute and are commonly known as the Union Pacific system, and that said railroads comprising said system are under one common control and management, and are operated as a single system.

28. That the railroads owned and operated by said respective companies comprising said Union Pacific system have been constructed, developed, and built up at great expense to a high physical standard; that traffic originating on any of them or received by any of them is transported and interchanged from one unit to another as destination requires at the following principal points of interchange:

(a) Between the Oregon-Washington Railroad & Navigation Company and the Oregon Short Line Railroad Company at Huntington, Oregon;

(b) Between the Oregon Short Line Railroad Company and the Union Pacific Railroad Company at Green River, Wyoming;

(c) Between the Oregon Short Line Railroad Company and the Los Angeles & Salt Lake Railroad Company at Salt Lake City, Utah; and

(d) Between the Union Pacific Railroad Company and Oregon Short Line Railroad Company at Ogden, Utah.

29. That the principal main line of the Union Pacific Railroad Company consists of a double-track railroad extending from Council Bluffs, Iowa, to Ogden, Utah; that it has not owned during any of the times herein mentioned nor does it now own any rail-
22a road within the State of Oregon; that during all the times herein mentioned the principal main line of railroad of the Los Angeles & Salt Lake Railroad Company has extended and does now extend from Salt Lake City, Utah, to Los Angeles, California; that the principal main lines of railroad of the Oregon Short Line Railroad Company extends (a) from a connection with the railroad of the Union Pacific Railroad Company at Granger, Wyoming, to a connection with the railroad of your petitioner at Huntington, Oregon, and (b) from a connection with said first main line at McCammon, Idaho, through Ogden to Salt Lake City, Utah; that said three railroad companies during all the times herein mentioned have been and are corporations organized and existing under and by virtue of the laws of the State of Utah; that the railroad mileage of

your petitioner referred to in paragraph 1 of this petition as owned and operated by petitioner consists of a total mileage of 2,365 miles and same represents a cost to your petitioner and an investment therein by it substantially in excess of $173,000,000; that during all the years of its operation said railroad property of said petitioner has been efficiently and economically operated and maintained by petitioner, but since its loss of the bulk of the western Oregon business, as alleged in paragraph 4 of this petition, it has received insufficient business to enable it to operate profitably to the extent of a reasonable return upon its investment in said properties, and its said operations during the past ten years have resulted in substantial losses year by year, with the result that it is now burdened with a corporate deficit in excess of $6,000,000; that it has been and is in excellent physical condition and adequately and efficiently equipped, with adequate capacity to normally and efficiently receive, handle, and transport during said years and at the present time four times the volume of traffic that it has had, now has, or has presently in prospect; that its principal interchange of east and west bound traffic is made with the Oregon Short Line Railroad Company at Huntington, Oregon, and that the movement of said traffic has for years preponderated and does now preponderate heavily eastbound.

30. That each and all of said corporations classified herein under said heading "Railroads comprising Union Pacific system" carry on and conduct interstate commerce by railroad between points in the States in which they operate and points in other States of the United States; that the route and service afforded by said Union Pacific system lines between points in eastern and southeastern Oregon and southern and southwestern Idaho on the one hand,
23a and Los Angeles and tributary territory via Salt Lake has been and is the most direct and efficient route existing, and same is shorter in distance and in all respects more efficient than will be the route between said points proposed via the cross-State line.

Article XI. Ontario-Burns line

31. In the year 1905 the interests by which the properties comprising the then so-called Union Pacific system and Southern Pacific lines were then controlled, caused to be incorporated and organized under the laws of Oregon the "Oregon Eastern Railway Company," for the dual purpose of obtaining a more direct and efficient line between San Francisco, California, and Portland, Oregon, and to move accessible western Oregon traffic, and particularly lumber traffic, for the East then moving by railroad, across central Oregon; that said company was empowered by its articles of incorporation to construct, maintain, and operate a line of railroad from Natron, near Eugene, Oregon, to Ontario, Oregon, with a line springing therefrom and proceeding south to Klamath Falls, Oregon, which by amendment was extended to Weed, California. Construction on

said lines was prosecuted with some interruption south from Natron, north from Klamath Falls, and west from Vale, Oregon (that portion of the routes from Weed to Klamath Falls and from Ontario to Vale having been previously constructed), when in November, 1910, petitioner herein having been incorporated, the partially constructed Natron cut-off line from Weed via Klamath Falls and Odell to Natron were conveyed to Central Pacific Railway Company and the remainder thereof from Ontario westerly were conveyed to petitioner. Thereafter and in December, 1912, by decision of the Supreme Court of the United States, the said Union Pacific Railway Company was required to and did pursuant thereto divest itself of the control of the Southern Pacific Company; that by reason of the control of the Central Pacific Railway Company by the Southern Pacific Company, access by petitioner via said Oregon eastern route to western Oregon traffic and to its terminal at Portland was cut off and no substantial traffic was left or available for the remaining part of said route from Odell to Vale. That petitioner thereupon completed its said line west from Ontario to Riverside, a distance of 93 miles, in 1913, and later, and in 1916 extended same to the terminus at Crane in the Harney Valley, 127 miles from Ontario, and in 1924 changed the route to the north and west and extended
24a the line through the Harney Valley to Burns, which point was and is in fact and by petitioner's articles of incorporation as amended, the western terminus of said line. Said Ontario-Burns line was acquired and constructed by petition at a cost in excess of $7,000,000, and same prior to said extension to Burns and since has been economically and efficiently operated, but during all the years of its operation the operating expenses thereof and the taxes thereon have exceeded the total operating revenues from same by more than $200,000 annually, with a maximum gross operating revenue for any one year of less than $210,000, and no substantial shipments have been made via said line to California destinations.

Article XII. Oregon & Northwestern Railroad

32. That during the years 1925 and 1926 a line of railroad was constructed from Burns, Oregon, in a general northerly direction for a distance of 50 miles to Seneca; that said railroad so constructed was chartered as a common carrier, and in the month of October, 1928, was acquired by Edward Hines Western Pine Company, and later and on the 12th day of June, 1929, said company received authority from the Commerce Commission to operate said Burns-Seneca line of railroad as such common carrier in interstate commerce under the name of Oregon & Northwestern Railroad, and that said railroad has been and is so operated, and while its primary purpose and business consists in the hauling of logs from the forested area in the mountains north of Burns and delivering same at Burns, it handles and transports as a common carrier such other traffic as is offered,

and by physical connection between it and your petitioner's railroad at Burns, any through business obtaining has been and is interchanged and transported by said connecting carriers.

Article XIII. Rogerson-Wells line

33. To enable the producers and shippers in southern Idaho and southeastern Oregon producing areas to more conveniently market their surplus products in the San Francisco Bay district in California, and at the urgent request of Idaho officials and shippers, said Oregon Short Line Railroad Company constructed a line of railroad from the terminus of its so-called Twin Falls branch at Rogerson, Idaho, to a connection with said Southern Pacific operated line at Wells, Nevada, a distance of 94 miles, at a cost of $3,435,000, opened the same for operation in February, 1926, interchange con-
25a nections having been made between the same and the railroads of the Southern Pacific Company and Western Pacific Railroad Company at Wells, Nevada; that said line has been continuously operated as a part of a through route between points on said railroad of the Oregon Short Line Railroad Company and its connections and points on said railroads of the Southern Pacific Company and Western Pacific Railroad Company and their connections, respectively, but after four years of operation very little use of same has as yet been made by shippers in said southern Idaho or southeastern Oregon territory or elsewhere; that said route is a more efficient route between points in southern Idaho and southeastern Oregon on the one hand and San Francisco bay points and tributary territory on the other than will or can be afforded by said proposed cross-State line, and same is not unreasonably long as compared with the route that would be afforded by the construction and operation of the proposed cross-State line, and while said Rogerson-Wells line was well constructed and has been efficiently and economically maintained and operated, said operations have failed to return an amount sufficient to pay current operating expenses and taxes but have resulted in an annual loss of more than $40,000 per annum from the beginning of operation thereof; that said line is an extension south from a line traversing and serving the extensive and productive irrigated land areas in the Twin Falls, Minidoka, Burley, and Hillsdale districts in south central Idaho and much heavier traffic is immediately tributary to said extension than will be tributary to the said proposed cross-State line in Oregon.

Article XIV. Map showing territory involved and existing railroads and proposed cross-State line

34. Attached hereto and made a part hereof as Exhibit C is a map illustrative of the territory involved in said proceeding before said Commerce Commission and mentioned herein, and showing the location of the railroad lines herein discussed, including the

proposed cross-State line called for by the order of the Commerce Commission herein complained of.

Article XV. Consideration of established facts refused by commission

35. That all and singular the facts hereinbefore in paragraphs numbered 6 to 33, inclusive, appeared upon the hearing of
26a said matter so brought and pending before said Commerce Commission and the evidence establishing same was before said commission upon the presentation and submission of said cause to said commission for its consideration thereof as aforesaid, and there was no testimony given or circumstance established from which an inference, presumption, or conclusion contrary thereto could or can lawfully be drawn or established (except that at the time of said hearing in 1928 it appeared that construction of the railroad between Klamath Falls and Alturas and the reconstruction of the line between Lakeview and Wendel was in progress, but the completion and placing of said lines in operation was duly reported to said Commerce Commission before the argument of said cause before said commission, and except that certain witnesses expressed as their opinion that some shippers in western Oregon and in Southeastern Oregon and southwestern Idaho would divert, route, and receive some freight via the proposed cross-State line if same were built and operated). In addition to the said facts as hereinbefore alleged, the evidence adduced upon the hearing of said cause and contained in the record thereof before said commission further established and demonstrates without dispute, among other facts, that:

(a) The proposed line is not and will not be justified if the Southern Pacific Company can not be required to interchange the traffic originated by it in western Oregon with this petitioner at the proposed junction, Crescent Lake; the purpose of the complainant in its said proceeding, docket No. 19680, was and is to compel said interchange to be so made at Crescent Lake instead of with the Union Pacific Railroad Company at Ogden; the western Oregon shippers for the most part will not route their traffic via the proposed cross-State line if it is built, and the Southern Pacific Company will not voluntarily make the proposed interchange at Crescent Lake; the Great Northern Railway Company will not voluntarily interchange its Klamath Falls or Bend business with said proposed line.

(b) The construction of the line in question is not sought or required to meet any existing demand, necessity, or convenience in the nature of better or additional transportation routes or facilities for the movement of any substantial amount of existing or presently available traffic, nor to require petitioner to provide itself with safe or adequate facilities for performing as a common carrier its car service as that term is used in the interstate commerce act, but on

the contrary complainant asserted and urged in presenting
27a said cause that in prosecuting same it planned for the future time if and when a greater demand comes for lumber from Oregon and when the lumber of the Southern and Eastern States is practically exhausted.

(c) The asserted and admitted purpose of complainant in said proceeding, docket No. 19680, was and is to obtain competitive railroad construction and service in western Oregon, and by obtaining said order of the Commerce Commission requiring said proposed construction to Crescent Lake so involve petitioner that it will be compelled to make further construction over and across the Cascade Mountains and into and through the timbered areas of western Oregon and over and across the Coast Range of mountains to the Pacific coast.

(d) The territory traversed by the proposed line and accessible thereto is incapable of producing traffic in sufficient volume to substantially contribute to its support or to justify its construction; the State of Oregon has expended in excess of $100,000,000 in the construction of a State highway system during the past few years, but no construction has been made in the areas local to or traversed by said proposed railroad and the construction of any first-class highway in Harney County is not contemplated.

(e) The products of the ten southwestern counties in Idaho and of the producing areas of Malheur County, Oregon, are and will continue to be similar in character to those raised and produced in western Oregon and in the State of Washington and to find market in San Francisco Bay communities must compete with said products of western Oregon and Washington, and if said proposed line is built, Washington and western Oregon producers will continue for the most part to enjoy a shorter distance to said San Francisco Bay market than obtains from southwestern Idaho and Malheur County points of origin, and lesser rates of transportation will continue to obtain in favor of said Washington and western Oregon shippers for that a larger bulk of said shipments can and does move and will continue to move by water from coast ports to said California destinations; western Oregon is sparsely settled, and, while producing to a small percentage of its capacity, said production is greatly in excess of local demand or ability to consume, and it is and will be indefinitely unable to consume or afford a market for any substantial volume of the products of southern Idaho except
28a for the city of Portland, which is the only large city or large commercial and industrial center in Oregon; intervening between the producing areas of southwestern Idaho and Malheur County, Oregon, and competitive therewith in San Francisco Bay markets are producing areas in Nevada, in the southern part of Lake and Klamath Counties in Oregon, and in central and northern California, and the consuming capacity of said San Francisco Bay markets to absorb the products of said competitive areas was not established; production in excess of market demand has and does

obtain as a general rule in the intermountain and adjoining Pacific Coast States with respect to the products of their lands; but Los Angeles and the districts immediately tributary thereto afford the largest and best existing and potential California markets for the products from the lands of the southern Idaho territory, including the ten southwestern counties of said State and the county of Malheur in Oregon.

(f) The lumber industry in Oregon, Washington, and Idaho, and in the western and Pacific coast country in general is and has been for many years last past in a depressed condition, and while the mills in the States and territory in question have been and are operating as a rule substantially below their capacities, their outputs largely exceed market demand therefor, and said operations are not as a rule, nor have they been for several years last past, profitable to said mill owners or operators, and if said proposed cross-State line should be constructed and thereby stimulate the production of lumber in said States or any of them the industry would thereby be greatly harmed, to the detriment of said States and of Oregon in particular. The bulk of timbered areas in eastern Oregon which are not reached or served by existing railroads are owned by the United States of America and are within the boundaries of national forests; that all of said national forests are administered for the United States by the United States Forestry Department under the direction of the Secretary of Agriculture of the United States, and the policy of said department has been for years, is now, and will be for many years in the future to conserve said stands of timber, and if and when cutting therefrom is permitted to limit the amount of the annual cut to a volume that will not exceed in amount the current growth in such forests.

(g) The expense upon petitioner involved in said alleged extension ordered constructed by said Commerce Commission as afore-
29a said would greatly impair the ability of petitioner to perform its duty to the public.

(h) The case of complainants before the commission and the report and order of the Commerce Commission with respect thereto contemplates and is limited to a railroad of branch-line quality of construction and the operation of mixed train service upon and over the same; the main lines of the petitioner, the Oregon Short Line Railroad Company, the Los Angeles & Salt Lake Railroad Company, the Southern Pacific Company, and Central Pacific Railroad Company have been built up at great expense and maintained to high standards of quality, efficiency, and safety in respect of roadbed, tracks, structures, facilities, and appurtenances whereby traffic is and can be transported via Portland and Huntington, via Alturas, via Wells, and via Ogden and Salt Lake, with very much greater frequency, speed, and efficiency than via the proposed cross-State line in connection with the Ontario-Burns line of your petitioner; the last-mentioned line extending from Ontario to Burns 151 miles is

not comparable with said main lines in construction or suitable for main-line business; two and one-half to three days' time would be required to move a shipment of livestock to Portland from Ontario via the proposed cross-State line, but such shipment under existing schedules would, if routed via Huntington and the present main line of petitioner, reach Portland within thirty-six hours.

(i) The tonnage movement on petitioner's said railroad has preponderated for years and does preponderate heavily eastbound and a diversion of westbound southern Idaho and/or southeastern Oregon traffic to the proposed cross-State line would aggravate the already unbalanced traffic interchange at Huntington and be attended with serious embarrassment and expense to petitioner's operations.

(j) Boise is located in the western part of southwestern Idaho on the main line of the Oregon Short Line Railroad Company and the distance therefrom via the proposed cross-State line and Southern Pacific Railway from the proposed junction at Crescent Lake to San Francisco would be 911 miles, more than one-third of which would be branch-line construction and operation, while the distance from Boise to San Francisco via Wells, Nevada, and the Southern Pacific is 968 miles, of which 785 miles is high-standard main line with a substantial part thereof double track and the remaining 183 a branch line of good construction; the distance from Boise to Los Angeles via Oregon Short Line Railroad Company and
30a Los Angeles & Salt Lake Railroad Company (Union Pacific system) is 1,204 miles, all main-line track, while via the proposed cross-State line and Southern Pacific Company the distance would be 1,375 miles, of which 320 miles would be of branch-line construction.

(k) At Crescent Lake for a considerable period during the winter the snow reaches a depth of ten feet and the temperature is down to zero and below, presenting an unfavorable situation for interchange of traffic and a much worse condition than exists on the line of your petitioner.

(l) No person or corporation owning, controlling, or interested in property along the entire 185 miles of proposed railroad construction represented or testified upon the hearing of the existence of any substantial business or traffic local to the proposed line available for or requiring transportation; while no irrigation projects are located immediately accessible to the proposed line, those situated remote from but in nearest proximity thereto were and are so hopelessly involved under excessive bonded debt that neither the governor nor other State officials having jurisdiction of same would advise any prospective settler to acquire or settle upon same until existing financial embarrassments of said irrigation districts are favorably adjusted.

(m) The efficiency of one line of railroad as compared with another for the performance of a required service is not determined

alone by the distance traversed, and while the route from western Oregon points to the common point of Granger, Wyoming, is somewhat greater via Alturas than via the proposed cross-State line, yet the route via Alturas to Granger affords 108 more miles of double track than the route via the proposed cross-State line, and the traffic and operating conditions are such that as fast a schedule can be maintained between western Oregon and Chicago via the Alturas route as via the cross-State line; the distance between the common point of Ontario, Oregon, and Portland is 430 miles over the present route via Oregon Short Line Railroad Company and petitioner's line as compared with 536 miles via the proposed cross-State line and Southern Pacific lines.

(n) The movement of sheep from eastern Oregon and southern Idaho heavily preponderates to eastern markets, but the cattle movement is largely to the market at Portland, Oregon, where union stockyards are maintained and operated, and to Puget Sound markets, and the difference in the freight rate from said points
31a of origin to said markets is and will continue to be so great as to compel the movements of livestock for coast destinations to go to Portland.

36. That in its consideration of said cause No. 19680 the Commerce Commission erroneously failed and refused to give legal effect to said established and/or undisputed facts or to any of them or to any evidence introduced by the petitioner and/or the defendants or any of them in said proceeding, and that by reason thereof and upon the record in said cause before said Commerce Commission the said report and the said order of the said commission was and is unreasonable, oppressive, unlawful, arbitrary, and void.

Article XVI. Finding of public convenience and necessity unsupported by evidence

37. That the said order of said Commerce Commission herein complained of was and is arbitrary, unreasonable, unlawful, and void for that said proposed line of railroad ordered by said Commerce Commission to be constructed by petitioner, as aforesaid, is not reasonably required in the interest of public convenience and necessity, and the finding of said Commerce Commission in its report in said cause—

"that an extension of the rail line of the O.-W. R. & N. (referring to this petitioner) now terminating at or near Burns, Oreg., from or near a station thereon designated as Crane, Oreg., to a connection with the Cascade line of the Southern Pacific at, or near, Crescent Lake, Oregon, by the Oregon-Washington Railroad & Navigation Company is reasonably required in the interest of public convenience and necessity"

was and is wholly unsupported by the evidence in said cause, docket No. 19680, and said finding was and is contrary to the evidence taken

in said cause, and that the evidence and the record therein affirmatively shows that said proposed line is not reasonably required in the interest of public convenience and necessity.

Article XVII. Petitioner's ability to perform its public duty impaired by proposed construction

38. That said order of said Commerce Commission was and is in excess of the jurisdiction of said commission and was and is arbitrary, unlawful, and void for that the expense involved as to said line of railroad ordered to be constructed by petitioner as aforesaid will impair the ability of the petitioner to perform its duty to the public, and the finding of said commission in its report in said cause—

32a "that the expense involved therein (referring to said proposed cross-State line) will not impair the ability of the carrier or carriers involved to perform their duty to the public"

was and is wholly unsupported by the evidence in said cause, docket No. 19680, and said finding was and is contrary to the evidence taken in said cause if said finding be considered as referring to petitioner, but in fact said finding was intended to refer to the ability of petitioner, Oregon Short Line Railroad Company and Union Pacific Railroad Company collectively, and the undisputed evidence and record therein affirmatively shows that the expense involved in and as to said so-called extension will impair the ability of petitioner to perform its duty to the public, and said Commerce Commission was without authority to base its said finding upon the financial ability of said Oregon Short Line Railroad Company or said Union Pacific Railroad Company; that said order of the commission is as to this petitioner in excess of the jurisdiction of the commission, arbitrary, unlawful, and void for that said commission has not found, as to said so-called extension, that the expense involved therein will not impair the ability of the petitioner to perform its duty to the public.

Article XVIII. Paragraph 21 of section 1 of interstate commerce act erroneously construed and applied

39. That while by its complaint in said cause, docket No. 19680, said Oregon commission alleged—

"This proceeding is commenced under the provisions of paragraphs (21) and (4) of section 1, of paragraph (3) of section 15, and of paragraphs (3) and (4) of section 15a of the interstate commerce act."

said cause was in fact presented by complainant and entertained by said Commerce Commission under that part of paragraph 21 of section 1 of said interstate commerce act which reads as follows, to wit:

"The commission may, after hearing, in a proceeding upon complaint or upon its own initiative without complaint, authorize or require by order any carrier by railroad subject to this act, party to such proceeding, to provide itself with safe and adequate facilities for performing as a common carrier its car service as that term is used in this act, and to extend its line or lines: Provided,
33a That no such authorization or order shall be made unless the commission finds, as to such extension, that it is reasonably required in the interest of public convenience and necessity, or as to such extension or facilities that the expense involved therein will not impair the ability of the carrier to perform its duty to the public."

And the decision and report of the said Commerce Commission and its said order entered in said cause were based upon said quoted part of said interstate commerce act, and that said Commerce Commission's proceedings in said matter and its consideration thereof and decision therein and its said order herein complained of were taken, had, and made under an erroneous and mistaken conception and theory of the law on the part of said Commerce Commission in the following respects, among others, to wit: In deciding that said paragraph 21 of section 1 of said act, or any other provision or provisions thereof, confer jurisdiction or authority upon said Commerce Commission to require by its order any carrier by railroad subject to said act and particularly this petitioner to (a) build the said or any line of railroad applied for by complainant in said proceeding, or to provide said expansive areas of central Oregon or the Umpqua or Rogue River Valleys or any other alleged inadequately served territory located west of the Cascade Mountains or elsewhere beyond and/or foreign to the territory occupied by petitioner, with the facilities for transportation by railroad, or (b) to open to settlement said vast areas or any additional area in central Oregon, or (c) to afford to shippers an additional or different or any other than existing routes for diverting shipments either north or south when reaching the north and south lines in western Oregon, or (d) to reduce the distance by railroad to eastern markets from any part of western Oregon, or (e) to reduce the distance by railroad from southeastern Oregon and southwestern Idaho to and from Pacific coast markets, or (f) to build branch or feeder lines from the cross-State line ordered by said Commerce Commission to be built by petitioner.

40. That after entering the Harney Valley from the east at or near the station of Crane, petitioner's Ontario-Burns line of railroad diverges to a northwesterly course and proceeds in a northerly direction to its terminus at Burns, where it connects with said Oregon & Northwestern Railroad, extending from Burns in a northerly direction to Seneca, and that said proposed cross-State line ordered to be constructed by petitioner as aforesaid would not be an extension or projection of petitioner's Ontario-Burns line of rail-

road but would proceed in a different direction than does said
34a Ontario-Burns line, and said cross-State line if constructed would be and constitute a branch line from said Ontario-Burns line, and would be entirely foreign to and beyond the scope of the provisions of said paragraph 21 of section 1 of said interstate commerce act; that said Commerce Commission in deciding that said proposed cross-State line would constitute an extension of petitioner's said line of railroad, and in ordering construction thereof as such, misconstrued and erroneously applied said provision of said interstate commerce act in conflict with its legal import.

41. That said paragraph 21 of section 1 of said interstate commerce act relates to, is associated with and the provisions thereof restricted by paragraph 10 of said section 1 of said act wherein the term "car service" is defined; and if said provision for extension of line or lines was or is valid or enforceable in any circumstances, the scope and extent of said provision of said act was and is confined to and the jurisdiction and authority of the commission thereunder is limited to the power of requiring petitioner to provide itself with such safe and adequate facilities as were and are reasonably required by petitioner in performing its car service in the immediate territory entered and ocupied by its railroad, and which facilities are necessary for the proper performance of the duties assumed by it in said territory local to its existing line and that obtain with respect to it by virtue of its existing railroad enterprise. That the complaint in said cause, docket No. 19680, presents no matter or question within the jurisdiction of said Commerce Commission under said paragraphs 21 or 10 of section 1 of said interstate commerce act, and in entertaining said complaint and in its interpretation and application of said provisions of said act and in making its said report and order in said cause, said Commerce Commission placed an unreasonable construction upon said interstate commerce act and the said provisions thereof and erred in its conception and theory of the law with respect to said matter, and in deciding same and in making said order herein complained of it exceeded its jurisdiction and authority in the premises.

Article XIX. Complainant's case before the Commerce Commission and the report and order of said commission disregard paragraph 4 of section 15 of the interstate commerce act,

42. That the preparation and presentation of testimony on behalf of complainant in said cause, docket No. 19680, whereby
35a to obtain an order of the Commerce Commission for the construction of said proposed cross-State line was by said complainant assigned to J. P. Newell, Esq., its consulting engineer, and in pursuance to said assignment said Newell prepared and presented to said Commerce Commission as evidence in the case his so-called "transportation cost study" and other testimony and exhibits to support said Oregon Commission's complaint in said matter; that said cause of said Oregon Commission was conceived and pre-

sented by it to said Commerce Commission upon the theory and plan of said Newell as reflected by his said cost study and testimony, and the said Newell spoke for the said Oregon Commission in the presentation of its said case; that the Commerce Commission approved and was controlled by the testimony of said Newell in its consideration of said cause and in the rendering of its report and the making of its said order therein. That the said cause of complainant was rested and based upon the premise of requiring the Southern Pacific to interchange the traffic originated by it in western Oregon and destined to eastern points to be surrendered by said Southern Pacific Company to the proposed cross-State line at the proposed junction, Crescent Lake, Oregon, and upon the premise and assumption, as found by the Commerce Commission in its said report, that all of the present rail movement between points in the ten counties in southwestern Idaho and San Francisco, California, and points adjacent thereto would be diverted from existing rail routes to and moved over the proposed cross-State line. By way of introduction and as a part of his testimony in said cause before said Commerce Commission, the said Newell testified:

"The crucial point in this case is the possibility of justly requiring the Southern Pacific to interchange traffic originated by it in western Oregon with the Union Pacific at the proposed junction, Crescent Lake."

And on the same subject said witness further testified:

"Q. You say that the crucial point in this case is the possibility of justly requiring the Southern Pacific to interchange traffic originated by it in western Oregon with the Union Pacific at the proposed junction. You would not assume that the cross-State line would be justified, or should be required, if the western Oregon traffic is not to be routed over that line—by western Oregon traffic that I mean, of course, traffic east and west to western Oregon?

"A. I think that is true.

"Exam. ROGERS. I would like to ask another question, before
36a we get so far from it in the record, and that is as to what traffic you had in mind when you told Mr. Spencer this morning that the cross-State line could not be justified without the western Oregon traffic, as I understood it, eastbound western Oregon traffic?

"A. Yes.

"Exam. ROGERS. Now, what traffic did you have in mind in making that statement?

"A. That traffic which has heretofore been and is to-day moving by the Southern Pacific through Roseville and through Ogden and delivered to the Union Pacific at Ogden.

"Exam. ROGERS. What I had in mind, did you have in mind that in addition to that western Oregon traffic that would, according to your assumption, move across the proposed line, and showing that has been made as to Idaho traffic westbound and that the traffic that would originate on the line?

"A. Well, his question——

" Exam. ROGERS. Just what did you have in mind?

"A. His question referred to the western Oregon traffic only, both in and out, and my answer referred to that, which—it is mostly lumber traffic, and the calculations of such traffic here presented are based first on the inclusion of the amount of traffic now moving, that is, as measured by the 1926 records, as moving to and from western Oregon through Ogden, therefore, traffic which passes over the Union Pacific at present and its natural growth as estimated and presented here plus those figures of natural growth which Mr. Teutsch presented as agricultural and animal product traffic.

" Exam. ROGERS. Well, the question I had in my mind was whether your answer contemplated this situation, that the Idaho traffic and the traffic originated on the cross-State line might move over the cross-State line, but unless it got this western Oregon traffic the line could not be justified?

"A. That was the intent of my answer; yes; I would doubt the justice of a compulsory building.

" Exam. ROGERS. Mr. Newell, one more question about this western Oregon traffic. What is your judgment, in the event that a compulsory or voluntary traffic arrangement is not entered into
37a between the Southern Pacific and the Union Pacific for interchange at Crescent, but assuming that the line is built and through rates established, do you think that the shippers can be depended upon to route their traffic over the cross-State line, notwithstanding that there is no traffic agreement between the carriers?

"A. I think that the shippers would be entirely indifferent to it, except as it might be a matter of speed on shipments where time was an element to the shipper, and I presume there would be a good many cases where that might enter in.

" Exam. ROGERS. Well, do you think that that would be true on lumber?

"A. I doubt if it would be important on lumber. It might be in some cases.

" Q. Well, if the saving that would be possible on that traffic was not being made now, how can you anticipate any part of that traffic would move down to Eugene and move over the cross-State line, merely from the fact that the Southern Pacific would get a part of the haul?

"A. I haven't anticipated it voluntarily. We have asked that it be made compulsory as regards the interchange at Crescent Lake, in spite of the fact that it would actually be profitable to both carriers to do it. * * *"

43. That in pursuance of said plan testimony was introduced on behalf of complainant of transcontinental traffic (as said term is defined in paragraph 10 of this petition) between western Oregon and eastern points and alleged estimates were made of such traffic and other traffic conceived to be possible for the proposed line for several

years, and by said testimony said transcontinental traffic was represented to be 27,218 carloads for the first year of operation of the proposed line and 3,410 carloads of lumber now moving east by petitioner's existing line of railroad from Bend to the East, and said 30,628 carloads of traffic was represented by said witness Newell as producing earnings from the transportation thereof via the cross-State line to the amount of $1,805,880, and said witness credited said proposed cross-State line with said traffic and said earnings, and in said connection and as a part of said plan complainant caused to be made an alleged estimate of other traffic to come into existence by reason of the construction and operation of said proposed line and designated said other traffic as "created traffic" and distributed said created traffic to imaginary destinations and applied rates thereon over said proposed line to said assumed destinations; that said created traffic so estimated was represented to amount to 3,777 car-
38a loads for the year involved, and to produce earnings for said proposed cross-State line of $134,996, and thereby said witness estimated that during the first year of operation of said proposed line 34,405 carloads of revenue freight would be transported over said line, with freight earnings, after deducting direct costs of freight service, amounting to $1,940,876, to which sum said witness Newell added $2,680 as passenger earnings estimated by him for said line during said first year of operation and deducted from the total $1,943,556 the sum of $405,800 indirect expenses and taxes estimated by him for said year, by which computations of the witness an estimated net return of $1,537,756 was made to appear for the first year of operation of said proposed line or 15.5 per cent upon the cost of the line involved, said cost having been estimated by the witness to amount to $9,908,000; that of the traffic capitalized for said proposed cross-State line as aforesaid more than 85 per cent thereof would, according to said proposal and plan, be diverted from existing railroads (for the most part from the Southern Pacific Company's lines) and of the revenue estimated by said witness to be realized therefrom more than 93 per cent thereof would, according to said computations, be derived from said diverted traffic.

44. That said plan and study of complainant in said cause as presented by said witness Newell contemplated and assumed, in addition to the construction of said proposed cross-State line, the purchase by petitioner of an undivided one-half interest in 71 miles of railroad between Bend and Chemult, Oregon, and the diversion by petitioner from its existing Deschutes River line between Bend and Sherman of the lumber traffic now transported over same by petitioner to and from said Bend-Chemult line and thence over the proposed cross-State line, thereby leaving said Deschutes line of petitioner with no substantial traffic to contribute to the expense of its maintenance and operation.

45. That paragraph 4 of section 15 of the interstate commerce act provides:

"In establishing any such through route the commission shall not (except as provided in section 3, and except where one of the carriers is a water line), require any carrier by railroad, without its consent, to embrace in such route substantially less than the entire length of its railroad and of any intermediate railroad operated in conjunction and under a common management or control therewith, which lies between the termini of such proposed through route, unless such inclusion of lines would make the through route unreasonably long as compared with another practical through route which could otherwise be established."

39a That the railroad companies comprising said Southern Pacific lines as described in Article V of this petition and the railroad companies comprising said northern lines as described in Article VII of this petition and the said Oregon Short Line Railroad Company, and each and all of them, appeared and introduced testimony in opposition to the said complaint of the Oregon Commission in said cause, docket No. 19680, and have and will refuse to divert voluntarily their said business to said proposed cross-State line, and this petitioner if it were able to do so would not voluntarily make the suggested purchase of said Bend-Chemult line for the purpose of diverting its Deschutes line traffic thereto.

46. That the Commerce Commission accepted and adopted said plan and proposal of said complainant and the computations and estimates of traffic, revenue and expenses of said Newell in its report in said cause as the basis for its said order herein complained of, and disregarded said provisions of said paragraph 4 of section 15 of said interstate commerce act, and its action in the premises and in making said report and order herein complained of is unreasonable, arbitrary and unlawful, and said action with respect to said matters in this Article XIX of this petition stated was taken and made by said Commerce Commission under an erroneous conception and theory of the law as applied to said facts and with respect to such cases.

Article XX. Bend-Chemult line foreign to issues in the case

47. That the acquisition by petitioner of said Bend-Chemult line of railroad or any interest therein is not proposed or referred to in or by the complaint in said cause, docket No. 19680, and that said matter was not and is not within the issues in said cause but is entirely foreign thereto, and that in entertaining and in considering the same as a part of the case of complainant in said cause and in using the alleged traffic and revenues conceived by the complainant's witness to any extent as a basis for its order upon petitioner to construct said proposed cross-State line, said Commerce Commission exceeded its jurisdiction and acted arbitrarily and without authority of law therefor.

Article XXI. Complainant's assignment of traffic to cross-State line and the estimate of earnings credited to same were unsupported by evidence and were based upon unwarranted assumptions, speculation, and conjecture

48. That in presenting the Oregon Commission's case to the
40a Commerce Commission, the said witness Newell, when questioned for the reasons actuating him in routing via the cross-State line that portion of western Oregon traffic that can move more economically eastbound via the line of petitioner through the Portland gateway than would be possible via the proposed cross-State line, stated that he was "trying to find some way to support the cross-State line." That in arriving at said so-called "created traffic" witnesses were presented by the complainant in said cause who gave their estimates of the tonnage that would be produced and move over the cross-State line and that in arriving at their so-called estimates said witnesses assumed the reclamation and cultivation of vast areas of now arid lands, the obtaining and application upon same of an adequate water supply for the growing of crops and sustaining of livestock, the settlement of said lands and establishment of homes thereon, the successful production of crops and livestock, and the existence of adequate consuming markets justifying the transportation thereof, the rehabilitation, refinancing and settlement of existing reclamation projects that have failed, and the diversion to the cross-State line of said imaginary tonnage from existing railroads. That the existing line of railroad of Oregon Short Line Railroad Company is available for and would ordinarily receive substantially all of said estimated tonnage produced and shipped from Idaho; that tonnage estimated by said witnesses to be created in Oregon amounted for the first year to 5,928 carloads, represented to be produced in 17 different counties; that of said carloads they represented that 863 carloads would be produced in the counties traversed by said cross-State line, and that the remainder of 5,065 carloads would be produced from the remaining 15 counties, all of which are remote from and inaccessible to the proposed cross-State line by any railroad of the petitioner except in the county of Malheur, to which county said witnesses credited an estimated production of 1,241 carloads; that said witnesses increased said estimated traffic to 11,641 carloads for the sixth year of operation of the proposed cross-State line and in doing so credited to Malheur County 5,174 carloads and to said Harney and Lake Counties 2,601 carloads. That no evidence was introduced and no facts established from which the production or movement of any considerable part of said traffic could legally be inferred or presumed, but that the coming into existence of same was and is based upon assumption, speculation, and conjecture, and that in estimating said traffic said witnesses entirely ignored and refused to give legal effect or consideration to the limited volume of traf-

fic established without dispute as having originated on
41a and/or moved over said Deschutes lines of railroad or over petitioner's said Burns-Ontario line of railroad, and with respect to the movement and routing thereof said traffic estimators wholly ignored the influence and control of existing lines of railroad, particularly the said Rogerson-Wells line of the Oregon Short Line Railroad Company; that the proposed routing of said estimated traffic over the proposed cross-State line was and is unreasonable and arbitrary and such movement thereof with respect to all of the traffic originating in the counties other than Malheur, Harney, and Lake is contrary to natural laws, to the interstate commerce act and to long standing and accepted practices of railroads generally in conducting transportation. That of the Oregon counties relied upon by said witnesses for said traffic production, Klamath County is served by two competing transcontinental lines of railroad as hereinbefore described, and by their testimony complainant's witnesses admitted that no substantial business originating in Klamath County would be diverted from the northern lines to said cross-State line; that of said 17 counties, Deschutes, Crook, Jefferson, and Wheeler are substantially the only source of traffic for the support of the existing railroads paralleling the Deschutes River and all of these counties are remote from said proposed cross-State line; that the Blue Mountain Range intervenes between said proposed cross-State line and Wheeler County, and by reason of said barrier, the large distance to be traversed, the arid condition obtaining along the proposed line, the lack of existing or prospective highways, it would be entirely impracticable, arbitrary, and unreasonable to credit traffic from said Wheeler County as available for said proposed line. That Baker County is also credited by said witnesses as a traffic producer for said proposed line, but the same obstacles are present in preventing the movement of any traffic therefrom for said proposed line as exist with respect to Wheeler County, and in addition thereto the said County of Baker is traversed by the main line of your petitioner extending between Portland and Huntington and by branch lines connected therewith in the so-called Homestead branch of petitioner and the Prairie City branch of the Sumpter Valley Railroad Company. That Grant County, likewise included by said witnesses, is served by Oregon & Northwestern Railroad connecting with the railroad of your petitioner at Burns. That all of the other counties included in said traffic estimate are on the west side of the Cascade Range of mountains, and the counties of Lane, Douglas, Lincoln, Coos, and Curry front on the Oregon seacoast and are traversed by the Coast Range of mountains, and Curry County is the
42a extreme southwestern county of the State of Oregon, traversed by no railroad but located more than 250 miles from the proposed cross-State line with great mountain ranges intervening.

49. That in computing the estimated revenue from the traffic thus theoretically diverted and created, complainant called on its behalf a

witness who, testifying as a rate expert, assumed the routing of said traffic over said proposed cross-State line (allowing no western Oregon business to move via Roseville or Alturas) and the routing of all southwestern Idaho traffic to which California destinations were allotted to said cross-State line to the exclusion of both the Salt Lake-Los Angeles line and the Rogerson-Wells line; that in applying said rates said witness emphasized the fact that he did not vouch for the volume of the traffic or the practicability of the movement. That thereupon said witness Newell accepted said traffic estimates and the rates applied thereon, and without sponsoring same but limiting his responsibility to the use and application of said traffic estimates and said proposed rates, prepared and introduced his transportation costs and operating studies and tables upon the assumption that said diverted and created traffic would move via the cross-State line and that the theoretical rates prescribed therefor would be realized from such movement; that said witness Newell testified that his entire studies were conditioned upon said assumed premises and that in the event of error or failure with respect to either of said assumed premises then his said studies, conclusions, and estimated earnings for said proposed cross-State line would fail and fall with such erroneous assumption; that said conclusions of said witness Newell are entirely unsupported by any facts or by any evidence from which a legal inference or presumption can be deduced; that nevertheless the said Commerce Commission accepted and adopted said estimates, rate applications, routings, and traffic movements conceived by said witness and the computations and conclusions of said Newell with respect thereto, all as a basis for the order of said commission herein complained of, and that the action of said commission in so doing was and is unreasonable, unlawful, and arbitrary, and that its order made in pursuance thereof was and is unsupported by evidence and was and is unlawful, unreasonable, and void.

Article XXII. Claim of savings from cross-State line plainly erroneous

50. That complainant's said case before the Commerce Com-
43a mission was and is based upon the contention by complainant that large economies and savings would be accomplished by the movement of Oregon traffic over the proposed cross-State line as compared with its movement over the Southern Pacific's route to Ogden either via Roseville or via Alturas; that in support of this contention said witness Newell introduced a table purporting to show net earnings on such traffic via Crane and the cross-State line with the interchange at Crescent Lake in comparison with the net earnings on such traffic moving via the Southern Pacific's route through Alturas with the interchange at Ogden, and according to said table so produced by the witness there were involved 17,284 carloads eastbound as compared with 788 carloads westbound, and thereby the

net earnings to the Union Pacific system lines are made to appear greater by $569,733 upon interchange of same at Crescent Lake as compared with interchange of such traffic at Ogden, and the net earnings of the Southern Pacific system upon said traffic are made to appear greater by $18,317 by making interchange of same at Crescent Lake instead of at Ogden; that said table and the computations therein were prepared and presented by said witness upon the assumption that the empty cars for said western Oregon business would be hauled from the East and as to cross-State line operations would be interchanged at Crescent Lake, and that the cost of moving said empty cars by the Union Pacific system lines from its eastern terminal at Omaha to Crescent Lake would amount to $130.05 per empty car, but in arriving at the conclusions stated in his said table of net earnings he charged to said eastbound loads only 60 per cent of the cost of moving said empty cars west for said eastbound traffic, whereas as appears in his said table the movement is 17,284 carloads eastbound as compared with 788 carloads westbound, or a preponderance eastbound of more than 95 per cent, and if the said actual cost of moving said empties westbound were charged against the said eastbound loads at $130.05 per car, said table would reflect an increased cost for said 35 per cent of said cars omitted as aforesaid amounting to $822,592, and instead of reflecting an increase in net earnings of $569,733 said table should in fact show a net loss of $252,859, but the same method of computing costs and net earnings was pursued and carried through and is reflected in the table and testimony of said witness discussed in paragraph 43 of Article XIX of this petition; that said tables and other tables and computations by said witness Newell were accepted and adopted by said Commerce Commission in its said report herein as a basis for its order herein complained of, and that the same and all thereof were and are
44a fictitious and arbitrary and the conclusions therein are mathematically erroneous in the light of the premises stated by said witness Newell, particularly with respect to cost involved in moving empty cars west for the purpose of transporting western Oregon business east via the proposed cross-State line; that the action of said Commerce Commission in accepting said computations of said witness Newell reflected by said tables set forth in its report as aforesaid as any basis or support for its said order in said cause was unreasonable, arbitrary, and unlawful.

Article XXIII. Other findings of Commerce Commission are unsupported by evidence and contrary to established facts

51. That in and by its report in said cause, docket No. 19680, said Commerce Commission made findings unsupported by evidence, contrary to the undisputed evidence in the case, and/or contrary to facts of common knowledge and of judicial cognizance as follows, to wit:

(a) Said commission found that "traffic now originating in western Oregon and destined to eastern points must move either south to

Roseville, California, or north to Portland, Oregon, before the eastward movement in reality begins," while in fact said Alturas line of the Southern Pacific Company was authorized and constructed for the movement of said traffic and is being used for the transportation thereof.

(b) Said commission found that "similar movement is experienced on traffic originating in eastern Oregon and southwestern Idaho destined to California points and to points in southwestern Oregon," while in fact existing routes afford substantially as direct and more efficient routes for said transportation to California destinations than can be afforded by the cross-State line, and no substantial movement of traffic to southwestern Oregon points has obtained from eastern Oregon and southwestern Idaho in the past, nor is it reasonably probable that such movement will obtain in the future if the cross-State line were built.

(c) Based upon its findings quoted in (a) and (b), said commission further found that "the resulting longer haul and greater time consumed renders it impossible to ship certain commodities of a perishable nature to what would be available markets if the shorter routes to be provided by the proposed extension were available," but for the reasons stated by petitioner in (a) and (b) above said
44a finding is an arbitrary conclusion unsupported by the evidence.

(d) Said commission's finding that "the major portion of the State of Oregon is without adequate transportation facilities, and this is particularly true with respect to the portion which would be served by the proposed construction," is an arbitrary finding and conclusion, contrary to the undisputed facts in the record, for that it appears that railroad construction in said state has been extensive and accomplished at great cost, and said railroads, including this petitioner, have been unable to obtain adequate traffic in respect of their Oregon operations (State and interstate combined) whereby to realize a reasonable return upon said investments already made, or any of them.

(e) Said commission's finding that "the basic resources of the territory which would be affected by the proposed line are lumber, grain, livestock, farm products, dairy products, and fruits" is unreasonable and arbitrary, for that by the undisputed testimony and actual experience said resources in producing territory will continue to be served by existing railroads and the conclusion that same will be affected by the proposed cross-State line is based solely on speculation and conjecture.

(f) Said commission's finding that "in addition to irrigated lands there is considerable land in this territory which can be 'dry' farmed so as to produce certain crops" is contrary to the undisputed evidence in the case; and the fact that said territory is not and can not be substantially productive of crops is a matter of common knowledge and of judicial cognizance.

(g) Said commission's finding that "there are very considerable stands of timber which could be opened up following the construction of this line. This timber is mature and will deteriorate rapidly" is arbitrary, for that by the undisputed testimony in the case there are no substantial timber areas adjacent to or reasonably accessible to said proposed line.

(h) Said commission's finding that "the timber in the Ochoco National Forest, as well as the privately owned timber in eastern and southeastern Crook County, southeastern Wheeler County, and southwestern Grant County, will be found tributary to the proposed line" is contrary to the undisputed evidence in the case and the implication that said timber or any thereof is available as traffic is unwarranted, for that no release of said timber in said national forests or any national forest for cutting has been or is assured, and no owner of private timber or mill operator has proposed or
46a assured the sale or cutting of said timber in the near future or the construction of mills required to manufacture the same.

(i) Said commission's finding that "the timber in the Deschutes National Forest, as well as the privately owned timber in northern Klamath County, while tributary in part to the Southern Pacific and the Great Northern, will be served in part by the proposed railway line" is arbitrary and contrary to the undisputed evidence in the case.

(j) Said commission's estimate of agricultural production and of the area of the land being farmed and of irrigated lands in Malheur County as stated in said report is grossly excessive, contrary to past experience and existing conditions and to official reports by Federal and State authorities pertaining thereto, and is based upon speculation and conjecture, and the findings of said Commerce Commission in said matters were and are arbitrary and unreasonable, and same is true as to the findings of said commission with respect to Lake and Harney Counties, particularly as to the estimate of prospective timber shipments and the representation that agricultural crops are being produced in a substantial volume by water pumped from wells in Lake County, the fact being that said reference pertains to a 60-acre tract of land upon which a well was driven by and at the expense of the State of Oregon, and the photographs referred to in said commission's report pertain to said isolated operation that has been conducted without expansion and with varying success over a considerable period of years at a location that is approximately 30 miles east of the Great Northern's Bend-Klamath line of railroad and said location is accessible to that railroad; that the finding that dry farming has not been carried on in Harney County due to lack of transportation by which to get products to market at reasonable cost is unreasonable and unsupported by the evidence in the case, and the reference to the driving of cattle from Harney County to Winnemucca instead of shipping same out by railroad refers to an isolated instance that happened in 1923 before the railroad to Burns was

constructed and before the Rogerson-Wells line was completed, and is irrelevant to existing conditions; that the commission's conclusions with respect to traffic possibilities at Alkali Lake is also involved in speculation and conjecture and the statement of the growing demand obtaining for the commodity (soda) is grossly exaggerated, unsupported by the evidence and contrary to the undisputed testimony in the record with respect to commerce conditions controlling the industry; that the said Alkali Lake is located some 20 miles,
47a more or less, from the proposed cross-State line and in order to accomplish substantial production large capital expenditure would be required in the construction of a plant and facilities at the location, and the construction of a railroad to connect with said proposed cross-State line, with a production according to the undisputed testimony of its proponents of only two to three carloads per day of low rated commodity situated remote from consuming markets; that the assumption that the proposed line would serve territory extending 50 miles on each side thereof is unreasonable, and in fact no areas capable of substantial production obtain in central as great as
Oregon at distances ~~within~~ 50 miles from existing railroads.

(k) The commission's implication that the State of Oregon is suffering from a shortage in car supply and that "the construction of the proposed extension would greatly relieve car shortages by avoidance of the long haul by present routes and by making available the supply of cars of the Union Pacific system" is unreasonable, unsupported by the testimony and contrary to the undisputed evidence in the case, for that the car shortage referred to by the commission in said finding on said matter pertained to instances when lumber
abnormal demand for ~~labor~~ obtained many years ago and long before the construction of the numerous railroads hereinbefore described; that the supply of cars for western Oregon by the undisputed facts in the case can be more readily and efficiently met by the making of empties at Portland and the bringing in and distribution of empties through Portland than by bringing empties across the proposed desert route.

(l) The commission's finding that the 10 counties of southwestern Idaho look principally to California for markets is contrary to the undisputed evidence in the case, for that during its commercial growth and development, as reflected by undisputed statistical data introduced during the hearing before the Commerce Commission, the shipments from said counties to the Pacific Northwest markets have greatly exceeded shipments to the California markets, and of the shipments to California destinations those to southern California in the Los Angeles district have greatly predominated, but with respect to some of the staple commodities extensively produced in said Idaho counties there has been a wide distribution throughout the States, particularly in the case of potatoes, which have found destination in carload lots in nearly every State in the Union, and

while in the case of cattle the shipments to the Pacific Northwest have predominated, sheep and lambs move in much greater
48a volume to eastern markets, and the San Francisco territory is so largely supplied with such products from areas intervening closer than southern Idaho that it has been unable to absorb the products from southern Idaho in the large volume anticipated upon the construction of the Rogerson-Wells line and its incapacity to do so has been so demonstrated by the undisputed facts in the record that such result can not be accomplished by the construction of the proposed cross-State line; that southwestern Idaho is a semi-arid country and the finding that dry farming can be successfully conducted therein is contrary to long past experience and to common knowledge and the evidence in the case; that successful production in said section is dependent upon irrigation is demonstrated by the record and the large expenditures made in the reclamation of lands and is a matter of judicial cognizance.

(m) The conclusion of the commission that the proposed construction would be a valuable asset to the Union Pacific system, or that the same would bring about a development in a vast territory or would be of material benefit to the present Ontario-Burns branch, is unsupported by the evidence in the case and contrary to the undisputed facts established by the record in said cause, and is based and arrived at solely upon speculation and conjecture.

(n) The finding of the commission that traffic moving from the East to western Oregon would logically move via the proposed cross-State line is contrary to and unsupported by the undisputed evidence in the case and is unreasonable and based upon conjecture and speculation.

(o) The commission's finding that "there is also substantial evidence that construction of feeder lines by other companies in western Oregon would follow construction of the proposed extension and that such lines would bring to the proposed line considerable traffic" is unreasonable, arbitrary, and based entirely upon speculation and conjecture, and there is no evidence in the record supporting such conclusion.

52. That the said order herein complained of was and is unreasonable, unlawful, and arbitrary, in that the making of same was induced by, and said order was in part based upon, said erroneous findings hereinbefore in this Article XXIII complained of, and that in the making of same said commission gave consideration to, approved, and acted upon matters foreign to and beyond the issues in said cause.

49a Article XXIV. Commerce Commission exceeded its jurisdiction and erroneously construed and applied law

53. That said Commerce Commission considered said cause, docket No. 19680, and made its report and order therein under erroneous conceptions and theories of the law applicable thereto

in the following, among other, particulars, viz, in erroneously assuming:

(a) That the provisions of the interstate commerce act contemplating efficient and economical management in the administration and operation of railroads subject to said act empower it, the said commission, to require by its order the construction by any such railroad of new, additional and different railroads than the existing railroads of such carrier or carriers, and thereby to establish other and different railroad routes and to direct, require, and compel the carrier or carriers involved to divert thereto its or their traffic from existing lines.

(b) That it, the said Commerce Commission, was clothed with authority and jurisdiction to require a carrier by railroad to construct a railroad line or lines into territory not reached or served by its existing line or lines and to develop, reclaim and render accessible for settlement vast unsettled areas remote from its said existing line or lines.

(c) That one common carrier by railroad subject to the interstate commerce act can acquire or be required by order of said commission to acquire an interest in, with right to use or joint use of or trackage rights over, another carrier by railroad subject to the act irrespective and in disregard of the desire of said carriers or either of them.

(d) That a common carrier by railroad subject to the interstate commerce act can be required by order of said Commerce Commission to build a line of railroad from a connection with its existing railroad to a connection with another railroad subject to said act to enable a shipper or shippers on its said originating railroad to ship and transport via such proposed route to the said proposed connection whereby to enable such shipper to test markets upon arrival at said proposed point of connection, and there to divert his said shipments to such destinations as he may determine upon.

(e) That the proposed line of railroad ordered by said Commerce Commission to be constructed by petitioner herein, from or near a station on its existing Ontario-Burns line of railroad designated as Crane, Oregon, to a connection with the Cascade line of
50a the Southern Pacific Company at, or near, Crescent Lake, Oregon, is in fact or law within the contemplation of paragraph 21 of section 1 of the interstate commerce act an extension of the line of railroad of petitioner now terminating at or near Burns, Oregon.

(f) That it was and is within the power and jurisdiction of the said Commerce Commission to require by its order the commencement of construction of said proposed line of railroad on or before July 1, 1930, and the completion of same and placing of it in operation before July 1, 1933, or within or before any other specified time.

(g) That the language of Congress (referring to paragraph 21 of section 1 of the interstate commerce act) does not afford the slight-

est foundation for a construction thereof which would limit the power of the Commerce Commission to comparatively short extensions in territory already served by the carrier or carriers involved.

(h) That but two conditions must be satisfied before the issuance of an order requiring such construction, (1) that the extension is reasonably required in the interest of public convenience and necessity, and (2) that the expense involved will not impair the ability of the carrier or carriers involved to perform their duty to the public, and that an order requiring construction beyond the territory local to and served by the carrier involved and not limited to facilities for performing by such carrier its car service, as said term is used in the interstate commerce act, is within the contemplation of said act and within the jurisdiction of the Commerce Commission to make, and that it is unnecessary to show as a condition for the granting of said order by said commission that the railroad so ordered to be constructed by the carrier involved will be able when constructed to earn its necessary operating expenses and lawful and necessary charges fixed upon it and its operations and/or a reasonable or any return upon the investment required and necessarily involved in its construction, and/or that said railroad considered as standing alone would of itself earn sufficient revenues to make it profitable.

(i) That the Union Pacific Railroad Company, Oregon Short Line Railroad Company, and Oregon-Washington Railroad & Navigation Company must for the purpose of said cause be considered together as one railroad company; that while title to the Ontario-Burns branch is held by the Oregon-Washington Railroad & Navigation Company, it is in reality owned by the Union Pacific Railroad Company through the ownership of the Oregon Short Line
51a Railroad Company, and in turn the latter's ownership of the Oregon-Washington Railroad & Navigation Company; that the relationship of the so-called extension to the Union Pacific system lines and its possibilities as a developer of traffic for the lines of railroad comprising that system must be considered and that as a basis for the making of said order it was proper, relevant, and material to show and consider a consolidated financial statement reflecting the result from railroad operations and from corporate investments of all of the four corporations comprising the Union Pacific system and to disregard the financial condition and earning ability of this petitioner and all other elements pertaining to the question of whether as to this petitioner the expense involved in the proposed railroad would impair its ability to perform its duty to the public; and that the making of said order complained of was and is justified and within the jurisdiction of the said Commerce Commission to make because it, the said commission, expects "that the cost of construction will be financed by the Union Pacific in a manner similar to that which it voluntarily followed in the construction of the

Burns extension," and that "it would be inconsistent and contrary to fairness to consider the new construction with relation only to the O.-W. R. & N. and apart from the Oregon Short Line and the Union Pacific."

(j) That the Commerce Commission has the same power and jurisdiction to compel the construction by an existing carrier by railroad subject to the interstate commerce act of a line of railroad upon a route specified by said commission from a connection with the railroad of such carrier, into and through territory not served by its existing lines and to a connection with another or other railroads remote from its existing lines whereby "a reasonable chance to develop a great State" may be afforded, as it, the said Commerce Commission, has to permit such carrier by railroad voluntarily to locate its own route and construct a railroad thereon into or through such territory for like or other purpose; and that any showing before the said Commerce Commission by such applying carrier that would in the opinion of said commission justify it in granting the said application of said carrier would be sufficient to sustain and justify said commission in requiring such carrier contrary to its judgment and will to construct such railroad as said commission determines upon along a route and within a time specified by said commission, and to operate the same.

54. That in its consideration of said cause, docket No. 19680, and in the making of its report and order therein, said Commerce
52a Commission applied and followed all and singular said erroneous conceptions and theories as reflected by said subdivisions (a) to (j), inclusive, of paragraph 53, Article XXIV, of this petition, and thereby and not otherwise said commission made said order herein complained of, and that each and all of said assumptions by said commission were and are contrary to law; that said Commerce Commission did not find or attempt to find, nor did it determine or attempt to determine whether said proposed construction by this petitioner, Oregon-Washington Railroad & Navigation Company, as a carrier by railroad subject to the interstate commerce act is or would be reasonably required in the interest of public convenience and necessity, or whether as to said proposed construction or facilities the expense involved therein would or will impair the ability of this petitioner to perform its duty to the public; that in each and every of said matters so conceived, assumed, and acted upon by said Commerce Commission in making its said decision and order as aforesaid, said commission proceeded and acted upon a fundamentally erroneous theory of the law and in disregard and in violation of the limitations of said commission's powers under the interstate commerce act and of the rights of this petitioner under the law, and by its said order said commission imposed upon this petitioner an investment and an operation for which no duty rests upon this petitioner under the law.

Article XXV. Petitioner's property appropriated by unreasonable construction given to paragraph 21 of section 1 of the interstate commerce act

55. That by the undisputed evidence in said cause, docket No. 19680, if the said proposed diversion to the cross-State line of the said western Oregon traffic from the Southern Pacific Company and of said southwestern Idaho traffic from the Oregon Short Line Railroad Company is not accomplished as suggested, the necessary out-of-pocket expense that must be incurred to reasonably maintain and operate said proposed cross-State line and to pay the current general taxes thereon will exceed the total operating revenues that can be obtained from its operations by at least $281,500 per annum, and the necessary cost of constructing and equipping said proposed railroad will exceed $9,000,000; that petitioner is without any funds available for said enterprise and if it can obtain same from any source the cost thereof to petitioner would amount to at least $540,000 per annum; that the said interpretation of said interstate commerce act, and particularly par'graph 21 of section 1 thereof, by said
53a Commerce Commission, and the order of said commission in pursuance of said interpretation whereby said loss, cost and expense and continuing loss, cost and expense will be imposed upon and necessarily incurred by petitioner and whereby this petitioner will be compelled to construct extensive railroad mileage into territory with respect to which it has no existing duties, is plainly unreasonable and leads to absurd and impracticable consequences; that the powers thus assumed by said commission transcend the power of regulation granted to it by said interstate commerce act, and amount to the assumption by said commission of the rights of both proprietorship and of management of petitioner's property; that in making and entering said order herein complained of said Commerce Commission acted arbitrarily and contrary both to the express provisions and manifest intent of said interstate commerce act and beyond its powers under said act and beyond the powers which could be granted to it by Congress under the Constitution of the United States.

Article XXVI. Provision concerning extensions of railroad lines in paragraph 21 of section 1 of interstate commerce act, as construed and applied by Commerce Commission is unconstitutional

56. That the provision in paragraph 21 of section 1 of the interstate commerce act with respect to the extension of the line or lines of carriers by railroad, as construed and applied by said Commerce Commission in making its said report and order was and is unconstitutional and void for that:

(a) Such legislation transcends the powers of Congress under the commerce clause of section 8, Article I, of the Constitution of the

United States in that it goes beyond the field of regulating commerce among the several States, and as so construed and applied it drafts the petitioner and appropriates its property for the reclamation and settlement of waste and unoccupied lands, the attempted creation of new traffic from such lands, and the location and establishment of new and different railroads and routes for serving such lands and for transporting such new traffic if any to be created therefrom and for handling other traffic proposed to be diverted from existing railroad lines; and the power to enact such legislation is not among the powers granted to Congress by the Constitution of the United States or the amendments thereto but is withheld from Congress by the tenth amendment to the Constitution of the United States.

(b) Said provision, as so construed and applied, will de-
54a prive petitioner of its property without due process of law in violation of the fifth amendment to the Constitution of the United States, the manner and extent of such deprivation being more particularly set forth in Article XXVIII of this petition.

(c) Said provision, as so construed and applied, will cause a substantial proportion of petitioner's property to be taken for public use without just or any compensation in violation of the fifth amendment to the Constitution of the United States, in that it will cause petitioner's said property to be used for the public purpose of re-
undeveloped
claiming and developing vast ~~desert~~ areas located in territory which petitioner has not undertaken to occupy or serve.

(d) Said provision, as so construed and applied by said Commerce Commission, will deprive petitioner of the liberty of managing and controlling its properties, in violation of the fifth amendment to the Constitution of the United States.

That petitioner now invokes and by its answer and brief filed with said Commerce Commission in said cause did then invoke the protection of the Constitution of the United States and said amendments thereto against the application of said provisions of said interstate commerce act as so construed by said Commerce Commission, and the petitioner asks the protection of said constitutional provisions and each thereof against the enforcement of the said order of said Commerce Commission herein complained of.

Article XVII. Commerce Commission's order invalid

57. That because said order of said Commerce Commission herein complained of is supported by no substantial evidence but is wholly unsustained by proof and is contrary to the undisputed character of the evidence adduced upon said hearing of said cause, docket No. 19680, and because of the erroneous, unreasonable, arbitrary, and illegal assumptions, acts, and conclusions of the said Commerce Commission in the hearing, consideration, and decision of said cause, all as hereinbefore in this petition set forth, and because the said

order of said commission is in violation of the Constitution of the United States and said amendments thereto, said order is unlawful, null, and void.

Article XXVIII. Irreparable injury threatened

58. That petitioner's railroad and equipment has cost in excess of $173,000,000 and the full and fair value thereof on the date of
55a the order herein complained of was and it is now substantially in excess of said sum, and that at said times its funded debt amounted to and is $95,074,575, represented by 4 per cent mortgage bonds outstanding, and its indebtedness to affiliated companies amounted to $25,973,759.77 as of December 31, 1927, and now exceeds said sum; that petitioner has been unable for ten years last past (except during the year 1926) to earn sufficient income from its operations to pay during any of said years its necessary operating expenses, rentals, taxes, and interest on its said debt; that its operations extend into and through important cities of the Pacific Northwest, including, Portland, Oregon, and Tacoma, Seattle, Spokane, Walla Walla, and Yakima, Washington, and that said operations have for several years last past required and will require for an indefinite period in the future large capital expenditures for grade separations and other local improvement assessments, a large part of which have been and are classified as additions and betterments and charged as additional investment in road and equipment, and the same conditions have obtained, obtain now, and will obtain in the future with respect to its lines of railroad generally, and particularly is this true in the matter of improvements in main line trackage, lengthening of passing tracks, replacements, terminal properties, and facilities, and other improvements that can not be avoided by any well conducted railroad in the normal maintenance and operation of its properties; that to meet said expenditures in the past petitioner has been compelled in large measure to borrow the funds required therefor and will be compelled to do so for a substantial and indefinite time in the future; that if said order herein complained of be permitted to become effective according to its terms, and unless and until said order is set aside and annulled by order of this court, the same will cause this petitioner great and irreparable injury and loss, and that in addition to the showing thereof hereinbefore made petitioner alleges and shows more particularly the nature of such irreparable injury and loss to be as follows:

(a) That said proposed railroad if constructed would cost at least $11,000,000 and would, if the petitioner were able to obtain the funds therefor, increase the long term interest bearing indebtedness of said petitioner by said amount and thereby seriously impair if not entirely destroy the credit and ability of petitioner whereby to raise and obtain the necessary funds currently required by it for improvements, additions, and betterments, as hereinbefore alleged.

(b) That petitioner's outstanding securities would suffer
56a and shrink in the market value thereof, to petitioner's serious loss and discredit in the financial markets of the country.

(c) That petitioner's ability to perform its duty to the public would be thereby seriously impaired.

(d) That said proposed railroad, if constructed, would terminate at a point in the Cascade Mountains more than one hundred miles from any line of railroad owned, controlled, or operated by petitioner or from any railroad company of the Union Pacific system, and several hundred miles from any railroad terminal of petitioner or of any railroad in said Union Pacific system of railroads, with the result that efficient and successful operation thereof by or under the direction of petitioner would be impracticable, but if efficient and economical management could be accomplished the operation thereof would necessarily entail a deficit of approximately $1,000,000 per annum.

(e) That to the extent traffic now received by petitioner from western Oregon and/or from southern Idaho is diverted from petitioner's present lines to said proposed cross-State line, the inadequate earnings of petitioner during recent years and now by its existing lines of railroad will be decreased and its ratio of operating expense to operating revenues will be greatly increased.

(f) That if petitioner refuses or neglects to comply with said order of said Commerce Commission it will, by the provisions of said paragraph 21 of section 1 of said interstate commerce act, as construed and applied by said commission and as same will be construed and enforced by defendant, be liable to a penalty of $100 for each day during which such refusal or neglect continues, and be exposed to repeated actions by the United States for the recovery by it of said accruing and accumulating penalties.

59. That petitioner has no adequate remedy at law in the premises.

Prayer

Wherefore, petitioner prays that a decree be entered herein setting aside, annulling, and suspending said order of the Interstate Commerce Commission hereinbefore set forth, and that the defendant, its officers and agents, be perpetually enjoined from enforcing or attempting to enforce said order; that the defendant and its officers and agents be perpetually enjoined from instituting or prosecuting any action or proceeding to recover any penalty or pen-
57a alties from the petitioner by reason of its refusal or neglect to comply with said order of the Interstate Commerce Commission; that the said provision in paragraph 21 of section 1 of the interstate commerce act concerning the extension of the line or lines of carriers by railroad subject to said act as construed and applied by said Commerce Commission as aforesaid be declared unconstitutional and void, and that the petitioner have such other and further relief in the premises as justice and equity may require.

The petitioner further prays that it be granted an interlocutory injunction pending the final hearing and decision of this cause whereby said defendant, its officers and agents be enjoined and restrained as hereinbefore prayed, and that upon final hearing the said injunction be made perpetual.

Docket No. 19680. Filed May 24, 1927

Before the Interstate Commerce Commission

PUBLIC SERVICE COMMISSION OF OREGON, COMPLAINANT

vs.

CENTRAL PACIFIC RAILWAY COMPANY, DES CHUTES RAILROAD COMPANY, Great Northern Railway Company, Northern Pacific Railway Company, Oregon Electric Railway Company, Oregon Short Line Railroad Company, Oregon Trunk Railway, Oregon-Washington Railroad & Navigation Company, Southern Pacific Company, Spokane, Portland & Seattle Railway Company, and Union Pacific Railroad Company, defendants

COMPLAINT

The complaint of the above-named complainant respectfully shows:

I. Complainant is a duly and regularly created and existing department of the State government of the State of Oregon and is authorized by law to file complaints before the Interstate Commerce Commission in the interest of the public.

II. The Central Pacific Railway Company is a corporation organized and existing under and by virtue of the laws of the State of Utah and is a common carrier engaged in the transportation of passengers and property wholly by railroad between points in the State of Oregon and points in other States and as such common carrier is subject to the provisions of the interstate commerce act as amended and supplemented. It owns lines of railroad within the State of Oregon, which lines are operated under lease by the Southern Pacific Company.

The Des Chutes Railroad Company is a corporation organized and existing under and by virtue of the laws of the State of Oregon and is a common carrier engaged in the transportation of passengers and property wholly by railroad between points in the State of Oregon and points in other States, and as such common carrier is subject to the provisions of the interstate commerce act as amended and supplemented. It owns lines of railroad within the State of Oregon, which lines are operated under lease by Oregon-Washington Railroad & Navigation Company.

Great Northern Railway Company is a corporation organized under the laws of the State of Minnesota and is a common carrier engaged in the transportation of passengers and property wholly by railroad between points in the State of Oregon and points in other States, and as such common carrier is subject to the provisions of the interstate commerce act as amended and supplemented. It operates under leasing arrangements or trackage rights from other carriers certain trains over lines of railroad within the State of Oregon. It owns one-half of the capital stock of Spokane, Portland & Seattle Railway Company except directors' qualifying shares.

60a Northern Pacific Railway Company is a corporation organized under the laws of the State of Wisconsin and is a common carrier engaged in the transportation of passengers and property wholly by railroad between points in the State of Oregon and points in other States and as such common carrier is subject to the provisions of the interstate commerce act as amended and supplemented. It owns one-half of the capital stock of the Spokane, Portland & Seattle Railway Company except directors' qualifying shares. It owns and operates certain lines of railroad within the State of Oregon.

Oregon Electric Railway Company is a corporation organized and existing under and by virtue of the laws of the State of Oregon and is a common carrier engaged in the transportation of passengers and property wholly by railroad between points in the State of Oregon and points in other States and as such common carrier is subject to the provisions of the interstate commerce act as amended and supplemented. It owns and operates by electricity lines of railroad within the State of Oregon. Its capital stock is owned by the Spokane, Portland & Seattle Railway Company except directors' qualifying shares.

Oregon Short Line Railroad Company is a corporation organized and existing under and by virtue of the laws of the State of Utah and is a common carrier engaged in the transportation of passengers and property wholly by railroad between points in the State of Oregon and points in other States, and as such common carrier is subject to the provisions of the interstate commerce act as amended and supplemented. It owns and operates lines of railroad within the State of Oregon.

Oregon Trunk Railway is a corporation organized and existing under and by virtue of the laws of the State of Washington and is a

common carrier engaged in the transportation of passengers and property wholly by railroad between points in the State of Oregon and points in other States and as such common carrier is subject to the provisions of the interstate commerce act as amended and supplemented. It owns and operates an interstate line of railroad between Fallbridge, Washington, and Bend, Oregon. Its capital stock is owned by the Spokane, Portland & Seattle Railway Company, with the exception of directors' qualifying shares.

Oregon-Washington Railroad & Navigation Company is a corporation organized and existing under and by virtue of the law of the State of Oregon. It is a common carrier engaged in the transportation of passengers and property by railroad between points in the State of Oregon and points in other States and as such common carrier is subject to the provisions of the interstate commerce act as amended and supplemented. It owns and operates numerous lines of railroad within the State of Oregon, including a line of railroad extending westward from Ontario to Crane, which line is operated under lease by the Oregon Short Line Railroad Company. Its capital stock is owned by Oregon Short Line Railroad Company, with the exception of directors' qualifying shares.

Southern Pacific Company is a corporation organized and existing under and by virtue of the laws of the State of Kentucky and is a common carrier engaged in the transportation of passengers and property wholly by railroad between points in the State of Oregon and points in other States and as such common carrier is subject to the provisions of the interstate commerce act as amended and supplemented. It owns and/or operates under lease and otherwise a number of lines of railroad within the State of Oregon.

Spokane, Portland & Seattle Railway Company is a corporation organized and existing under and by virtue of the laws of the State of Washington and is a common carrier of passengers and property wholly by railroad between points in the State of Oregon and points in other States and as such common carrier is subject to the provisions of the interstate commerce act as amended and supplemented. It owns and/or operates under lease or otherwise certain lines of railroad within the State of Oregon.

Union Pacific Railroad Company is a corporation organized and existing under and by virtue of the laws of the State of Utah and is a common carrier of passengers and property wholly by railroad between various points in Utah, Colorado, Wyoming, Kansas, and Nebraska and points in the State of Oregon and other States, and as such common carrier is subject to the provisions of the interstate commerce act as amended and supplemented. It owns the entire capital stock of the Oregon Short Line Railroad Company. The Union Pacific Railroad Company and the Oregon Short Line Railroad Company together own the entire capital stock of the Los Angeles & Salt Lake Railroad Company. The Union Pacific Railroad Company, Oregon Short Line Railroad Company, Oregon-

Washington Railroad & Navigation Company, and the Los Angeles & Salt Lake Railroad Company comprise what is
61a known and designated commonly as the Union Pacific system.

The four corporations are treated as one and their operations and the statistics relating thereto are included in the report of the Union Pacific Railroad Company.

III. The above-mentioned defendants provide in substance the the service of transportation of passengers and property performed by common carriers within the boundaries of the State of Oregon, both in interstate and in intrastate commerce. Some additional service of transportation of passengers and property performed by the defendants above named are furnished and performed by other common carriers but the defendants named deliver a very great part of the total number of passengers and the total volume of freight tonnage reaching destination at points within the State of Oregon in either interstate or intrastate commerce and originate by far the largest part of the total passenger and freight traffic moving from points within the State of Oregon in either intrastate or interstate commerce.

IV. The defendants in the past have failed and refused and still fail and refuse to provide a very large area of many thousand square miles in extent in central Oregon with adequate and reasonable facilities of transportation by railroad, although the existing line of railroad from Ontario, Oregon, to Crane and to Harriman, Oregon, is a part of a line of railroad projected many years ago by the Union Pacific system to extend from Ontario in a westerly direction across the State to a connection at some suitable point in western Oregon with the Southern Pacific Company. Between (a) Crane or Harriman in eastern Oregon and (b) Crescent Lake or some point in the vicinity thereof on the existing line of railroad operated by the Southern Pacific Company and commonly known as the Natron cut-off there is a practicable and feasible route for the construction of a line of railroad, which, when built, would provide such facilities. Adequate provision without delay of such facilities is demanded by public interest, convenience, and necessity. The expense involved in the extension of lines aforesaid will not impair the ability of the defendants or any of them to perform their duty to the public.

V. Some of the consequences of the failure and refusal of the defendants or some of them to build and operate a line of railroad through and across central Oregon as aforesaid are as follows:

1. The development of a vast area of the territory of the State is prevented and rendered virtually impossible.

2. The natural resources of such undeveloped area and its possibilities for producing traffic for a railroad across the State, although extensive, are rendered of little or no value.

3. Much of the freight and passenger traffic (both intrastate and interstate) handled by the defendants from and to points in Oregon must traverse unduly and unreasonably circuitous routes.

4. Much money and time are lost to the shipping and traveling public through being compelled to use those circuitous routes and to pay rates and fares based on the distances thereover.

5. Opportunity is lost for effecting largely increased economy and efficiency in handling the lumber of the Willamette Valley moving to eastern destinations.

6. The products of Oregon in considerable part are subjected to excessive and unreasonable delay in reaching the principal seaports and consuming markets of the State.

7. The severity of car shortages in Oregon recurring periodically in the past and the losses therefrom suffered by shippers have been augmented needlessly and unreasonably, and so will continue to be, until the extension of lines herein sought shall have been made.

8. Interior Oregon is denied the benefits of reasonable competition between the defendants in the matter of the service and facilities of transportation due to be accorded by them and is deprived of adequate outlets for its products to markets in California and in western Oregon.

VI. The construction and operation of a line of railroad from Crane or Harriman westward to a connection with the Southern Pacific Company's rails at Crescent Lake or some point near thereto and the establishment between defendants and the projected line of railroad of through routes and joint rates and divisions
62a thereof are necessary and desirable in the public interest, and such joint and common use of the projected line should be prescribed as may be just and reasonable and as will afford adequate service and will maintain and assure maximum competition and the most efficient use of cars, equipment, and facilities. The extension sought herein is reasonably required in the interest of public convenience and necessity and the expense involved therein will not impair the ability of the defendants or any of them to perform their duty to the public.

VII. This proceeding is commenced under provisions of paragraphs (21) and (4) of section 1, of paragraph (3) of section 15, and of paragraphs (3) and (4) of section 15a of the interstate commerce act.

VIII. By reason of the facts herein stated the defendants unlawfully and in violation of sections 1, 15, and 15a of the interstate commerce act have failed and refused and still fail and refuse to give due consideration to the transportation needs of the State of Oregon and to the necessity under honest, efficient, and economical management of enlarging their existing transportation facilities in order to provide the people of the State of Oregon with adequate transportation and to that end to extend their lines and to operate the same substantially as demanded herein.

Wherefore, complainant prays that defendants may be severally required to answer the charges herein; that after due hearing and investigation an order be made commanding the defendants and each

of them to cease and desist from the aforesaid violations of said act and requiring some one or more of them to extend and construct a line of railroad between Crane or Harriman, Oregon, on the east and Crescent Lake or some adjacent point on the line of the Southern Pacific Company on the west and commanding defendants to establish and maintain just and reasonable through routes and joint rates with such extension and just and reasonable divisions of such joint rates and just and reasonable terms and conditions under which such through routes shall be operated; and that such other and further orders or requirements be made as the commission may consider proper in the premises.

No. 19680

PUBLIC SERVICE COMMISSION OF OREGON
v.
CENTRAL PACIFIC RAILWAY COMPANY ET AL.

Submitted October 30, 1929. Decided December 3, 1929

The construction of a rail-line extension between Crane, Oreg., and a connection with the Southern Pacific at or near Crescent Lake, Oreg., by the Oregon-Washington Railroad & Navigation Company is reasonably required in the interest of public convenience and necessity, and the expense involved therein will not impair the ability of the carrier to perform its duty to the public. Construction of extension required

William P. Ellis and William C. McCulloch for complainant and certain interveners.

Ben C. Dey and Guy V. Shoup, for Central Pacific Railway Company and Southern Pacific Company; J. M. Souby, F. J. Betz, and A. C. Spencer for Oregon-Washington Railroad & Navigation Company, Des Chutes Railroad Company, Oregon Short Line Railroad Company, and Union Pacific Railroad Company; Chas. A. Hart, Charles E. McCulloch, and Carey & Kerr, for Spokane, Portland & Seattle Railway Company, Oregon Trunk Railway, Oregon Electric Railway Company, Great Northern Railway Company, and Northern Pacific Railway Company, defendants.

J. M. Thompson and Samuel L. Newton for Public Utilities Commission of Idaho; H. H. DeArmond for city of Bend, Oreg., and Chamber of Commerce of Bend, Oreg.; L. M. Bechtell and A. R. Bowman for city of Prineville, Oreg., Crook County, Oreg., and Prineville Business Men's Club; Robert M. Duncan for Harney County, Grant County, Malheur County, Oreg., Ontario Chamber of Commerce, and Burns Chamber of Commerce; James T. Chinnock and J. R. Harvey for Grants Pass Chamber of Commerce and city of Grants Pass, interveners.

Report of the Commission

McManamy, Commissioner:

By complaint filed May 24, 1927, the Public Service Commission of Oregon, acting for the people of the State, alleges, in substance, that defendant carriers have failed and refused to provide reasonable and adequate facilities of transportation by railroad to a large area within the State of Oregon and that such facilities are reasonably required in the interest of public convenience and necessity, and that the expense of providing such facilities will not impair defendants' ability to perform their duty to the public.

Defendant carriers in this proceeding are Central Pacific Railway Company, Des Chutes Railroad Company, Great Northern Railway Company, Northern Pacific Railway Company, Oregon Electric Railway Company, Oregon Short Line Railroad Company, Oregon Trunk Railway, Oregon-Washington Railroad & Navigation Company, Southern Pacific Company, Spokane, Portland & Seattle Railway Company, and Union Pacific Railroad Company.

We are asked to require one or more of defendant carriers to extend and construct a line of railroad between Lawen, a point near Crane, Oreg., on the east, and Crescent Lake, or some adjacent point, on the line of the Southern Pacific Company, on the west. We are also asked to require defendant carriers to establish, operate, and maintain just and reasonable through routes and joint rates with such extension, to prescribe reasonable terms and conditions under which such through routes shall be operated, and to require such common use of the extension as may be reasonable and necessary in the public interest.

Various Oregon municipalities and commercial organizations, and the Public Utilities Commission of Idaho intervened and were heard in support of the complaint.

For convenience the Central Pacific Railway and the Southern Pacific Company are referred to jointly herein as the Southern Pacific; the Oregon-Washington Railroad & Navigation Company as the O.-W. R. & N. and the Oregon Short Line Railroad as the Oregon Short Line; the Union Pacific Railroad as the Union Pacific. The Des Chutes Railroad, Oregon Short Line, O.-W. R. & N., and the Union Pacific are referred to jointly herein as the Union Pacific lines, and the Great Northern Railway as the Great Northern. Unless otherwise stated, all points and counties named are within the State of Oregon.

In their answers to the complaint defendants aver that there is no public necessity, interest, or convenience to be served by the requested construction, and that there is no authority in law for the granting of the relief prayed for. They urge that if paragraph 21, of section 1, of the interstate commerce act, or any other provision thereof, be construed as conferring upon us authority to require defendants, or either of them, to construct, or join in the construction and operation of the requested extension, such provisions are unconstitutional in that the same would operate to deprive them of their property without due process of law, and take from them their private property for public use without just compensation, in violation of the fifth amendment to the Constitution.

Substantially the same general issues were before us in Construction of Lines in Eastern Oregon (111 I. C. C. 3), decided May 3, 1926, hereinafter referred to as the Oregon case. In that report a number of applications by carriers for certificates of public convenience and necessity, dealing with other construction and arrangements in this territory, were also disposed of. In dismissing the complaint, we said that the record in the Oregon case could not be depended upon to speak clearly as to future traffic and its financial results, because of conditions changed since that record was made. Subsequently a petition was filed by complainant asking us to reopen the proceeding in order that opportunity might be afforded to present new evidence as to the proposed line between Harriman and Odell. In denying the petition we said that if, after considering our views as to the disposition of the finance dockets, the Oregon commission desired to urge the building of the Harriman-Odell line, a new complaint with that object might be filed. (Construction of Lines in Eastern Oregon, 117 I. C. C. 737, 741.) Further changes in the transportation facilities in this territory were considered and authorized in Construction by O., C. & E. Ry. (138 I. C. C. 99).

The issues in this case are deserving of the most careful consideration. A line of railroad across central Oregon has long been the desire of her people and they have hopefully looked forward to the construction of such a line. The accompanying map shows the vast

area within the State which is without rail facilities. The area probably constitutes the largest area within the United States which is without rail facilities.

The necessity for the construction must be viewed in the light of conditions as they are reflected by the present record. Two principal questions are presented, first, as to our authority to require such construction, and second, whether the facts of record are sufficient to justify the exercise of that authority if such has been vested in this commission.

Paragraph 21, of section 1, of the interstate commerce act provides, in part, that:

"The commission may, after hearing, in a proceeding upon complaint or upon its own initiative without complaint, authorize or require by order any carrier by railroad subject to this act, party to such proceeding, to provide itself with safe and adequate facilities for performing as a common carrier its car service as that term is used in this act, and to extend its line or lines: Provided, That no such authorization or order shall be made unless the commission finds, as to such extension, that it is reasonably required in the interest of public convenience and necessity, or as to such extension or facilities that the expense involved therein will not impair the ability of the carrier to perform its duty to the public."

It is not our province to pass upon the constitutionality of statutes enacted by Congress. (Telephone and Railroad Depreciation Charges, 118 I. C. C. 295, 326; Interchangeable Mileage Ticket Investigation, 77 I. C. C. 200, 202.) We are an administrative body which may not presume to annul by interpretation an act of the Federal Legislature. (In the Matter of Pipe Lines, 24 I. C. C. 1, 4.) The primary rule of statutory construction is to give effect to the intention of the legislature. Whenever that is apparent it dominates and interprets the language used. (Rodgers v. United States, 185 U. S. 83, 86.) This paragraph empowers us to authorize or require a carrier subject to the act to extend its line or lines. (Alabama & V. Ry. Co. v. Jackson & E. Ry. Co., 271 U. S. 244.) The transportation act, which added this paragraph to section 1, seeks affirmatively to build up a system of railways prepared to handle promptly all interstate traffic, and earnings enough to maintain their properties and equipment in such a state of efficiency as to carry this burden. To achieve this purpose it puts the railroad system more completely than ever under the fostering guardianship and control of this commission, which is to supervise their joint use of terminals, their construction of new lines, their abandonment of old lines, and secure a fair return upon the properties of the carriers engaged. (Dayton-Goose Creek R. Co. v. United States, 263 U. S. 456, Railroad Comm. of California v. Southern Pacific Co., 264 U. S. 331.)

This paragraph plainly empowers us to authorize or require a carrier subject to the act to extend its line or lines. Defendants by construction endeavor to restrict our power to comparatively short

extensions in territory already served by the carrier or carriers involved. There is not the slightest foundation in the language of Congress for such a limitation. The language is so clear and its meaning so plain that no difficulty attends its construction. Adherence to its terms leads to nothing impossible or plainly unreasonable. We are therefore bound by the words employed and are not at liberty to conjure up conditions to raise doubts in order that resort may be had to construction. It is elementary that where no ambiguity exists there is no room for construction. Compare United States v. Missouri P. R. Co. (278 U. S. 269).

We find that authority has been vested in us to authorize or require the construction prayed for if the conditions set out in the statute are satisfied and the facts otherwise warrant the construction.

Two conditions must be satisfied before the issuance of an order requiring the construction, (1) that the extension is reasonably required in the interest of public convenience and necessity, and (2) that the expense involved will not impair the ability of the carrier or carriers involved to perform their duty to the public. (Construction of Lines in Eastern Oregon, 111 I. C. C. 3; Los Angeles Passenger Terminal Cases, 142 I. C. C. 489; Gunderson v. Chicago, M. & St. P. Ry. Co., 91 I. C. C. 702; Cooke v. Chicago, B. & Q. R. Co., 66 I. C. C. 452; Ridge Coal Mining Co. v. Missouri Pac. R. Co., 62 I. C. C. 259.)

The view of the Public Service Commission of Oregon, as expressed by two members thereof, is that the development of central and western Oregon is being seriously hampered due to the absence of an east-and-west line of railroad across the State. Traffic now originating in western Oregon and destined to eastern points must move either south to Roseville, Calif., or north to Portland Oreg., before the eastward movement in reality begins. Similar movement is experienced on traffic originating in eastern Oregon and southwestern Idaho, destined to California points and to points in southwestern Oregon. The resulting longer haul and greater time consumed renders it impossible to ship certain commodities of a perishable nature to what would be available markets if the shorter routes to be provided by the proposed extension were available. Present routes which are termed unduly circuitous have similar effect on the marketing of agricultural products, livestock, and lumber.

It is urged that Oregon's development, as compared with other States, has been held back and seriously hampered, due to the lack of direct routes to the markets for her products and that the construction of the proposed extension is an important part of anticipated development of adequate rail transportation facilities within the State. The evidence of complainant and defendants brings out clearly and forcibly that no section can develop without transportation. The major portion of the State of Oregon is without adequate transportation facilities and this is particularly true with

respect to the portion which would be served by the proposed construction. The Oregon commission points to the fact that the proposed construction is not a new idea, but would in reality be a partial completion of a program of rail construction started by the Union Pacific lines many years ago. The events leading up to the cessation of this construction work are fully set forth in the Oregon case, supra, and it is unnecessary to repeat them here. It is sufficient to say that the location of the extension as proposed by the Oregon commission follows the original survey of the Union Pacific and would connect what is now in effect a branch line from Ontario to Burns, Oreg., with the so-called Natron cut-off of the Southern Pacific, which is what was contemplated when the construction was first extended west from Ontario.

The principal existing rail lines and those under construction in this territory, as well as the proposed extension, are shown by the accompanying map. The proposed line would leave the present Ontario-Burns branch of the O.-W. R. & N. at Lawen, near Crane, and extend westward to a point on the Cascade line of the Southern Pacific at or near Crescent Lake, a distance of approximately 185 miles. The proposed extension would cross, approximately 21 miles east of Crescent Lake, the recently constructed line of the Great Northern running from Bend to a connection with the Southern Pacific at Chemult.

It will be observed that the proposed extension would connect directly with the Southern Pacific, Great Northern, and O.-W. R. & N. The O.-W. R. & N. is a part of the Union Pacific system. The latter system embraces the Union Pacific Railroad, Oregon Short Line, O.-W. R. & N., and the Los Angeles & Salt Lake Railroad. On December 31, 1927, all of the stock, except 15 shares, of the O.-W. R. & N. was held by the Oregon Short Line. All of the stock of the Oregon Short Line was held by the Union Pacific. The directors of the Union Pacific are, with two exceptions, also directors of the Oregon Short Line and O.-W. R. & N. These companies have the same president. The Union Pacific, Oregon Short Line, and the O.-W. R. & N. are parties in this proceeding and in view of the relation shown above they must for practical purposes be considered together. While the Ontario-Burns branch is held by the O.-W. R. & N., it is entirely separated therefrom and connects with and is operated under lease by the Oregon Short Line. This branch is in reality owned by the Union Pacific through the ownership of the Oregon Short Line and, in turn, the ownership of the O.-W. R. & N. by the Oregon Short Line. Only in the most technical sense could an extension of the Ontario-Burns branch to Crescent Lake be considered an extension of the O.-W. R. & N. apart from the Oregon Short Line and the Union Pacific Railroad.

The Ontario-Burns branch extends from Ontario to Crane, a distance of approximately 127 miles, and from Crane to Burns a distance of approximately 30 miles. The construction to Crane was

completed in 1916. The extension from Crane to Burns was completed in 1924 and was constructed primarily to reach lumber-mill operations at Burns.

One essential distinction between this case and that before us in the Oregon case, supra, is that in the latter case the Oregon commission was seeking the construction of a line from Crane to a connection with the Southern Pacific and joint or common use of the line of the Southern Pacific between Eugene and Klamath Falls, while here the issue is confined to construction of a line from Crane to a connection with the Southern Pacific.

The requests of the Oregon commission and the interveners in the present case are not directed to any particular carrier, but the general thought expressed upon the record is that the proposed line should be built by the O.-W. R. & N. Much of the testimony is based upon the assumption that the extension is to be built by the O.-W. R. & N. The feeling that the proposed extension should be built by the O.-W. R. & N. is associated with the thought that the great need of the State of Oregon is additional east and west railroads.

GENERAL DESCRIPTION OF THE TERRITORY

For the greater part of the distance between Ontario and Crane the present line follows the Malheur River and passes through Malheur Canyon. Proceeding west from Crane somewhat swampy areas are encountered for a distance of approximately 20 miles in the vicinity of Malheur Lake. The area included in the next 15 miles is referred to as alkali flats where the topsoil has been blown into sand ridges. A limited area west of this portion contains considerable grassland and some land capable of reclamation and cultivation. The succeeding area for a distance estimated from 75 to 115 miles is a rolling country with an altitude varying from 3,500 feet to approximately 4,500 feet. This area approaches the foothills of the Cascades and the timbered area of the Paulina National Forest through which the extension would pass for the remaining portion of the distance to Crescent Lake.

The area along the proposed line is sparsely settled. It is said that when the original survey was made through this section prior to 1912 many homesteads were taken up but these were largely abandoned after it was determined that the line would not be built.

There is some difference of opinion as to the nature of the soil in several portions of the area which would be tributary to the proposed line. The annual rainfall in the area to be traversed by the line is less than 14 inches. With the exception of mountainous areas the snowfall is not very great in this territory.

While witnesses for defendants had considerable to say at the hearing with respect to the unproductiveness of central Oregon this section was described as follows in a publication by the Southern Pacific for general information of the public:

"CENTRAL OREGON: This rich and productive district was formerly called desert country. The rainfall averages from 10 to 12 inches, so that in some places it is necessary to irrigate the rich volcanic ash soil to secure good crops. Alfalfa, grain, and all root crops are grown successfully. Dairying and poultry raising are important industries. Where dry farming methods are carried on intelligently, fair crops of grain are produced. The elevation of Central Oregon varies from about 2,500 to 4,750 feet. It is a district of abundant sunshine, and where irrigation is not practiced the traveler will see vast stretches of sagebrush, the home of countless jackrabbits. Stock raising is one of the principal industries of this region. There is a large amount of Government land and State school land in central Oregon, but it is a country with few railroads, and settlers in many districts are few and far between. Branch experiment stations at Moro and Burns serve the settlers in recommending approved varieties of seed grain, method of dry land tillage and other farm practices."

The basic resources of the territory which would be affected by the proposed line are lumber, grain, livestock, farm products, dairy products, and fruits. This statement includes the western portion of Oregon and southwestern Idaho as well as the territory along the extension. These will later be considered in detail.

IRRIGATION PROJECTS

As is true in many Western States the matter of water supply in the territory to be served directly or indirectly by the proposed line is one of the most important governing factors in agricultural development. Several irrigation projects have been undertaken with varying degrees of success. These projects represent large investments, partly by the Federal Government. Some difference of opinion is expressed as to the practicability of some of these projects and as to the areas which can actually be irrigated. The irrigation projects include those in southwestern Idaho. Difficulty has been experienced in the financing of some of the projects in Oregon, and this has retarded development, but it appears that the projects have real merit and that the difficulty is due to the manner in which financial matters were handled. This financial situation is under investigation by State authorities and, as stated by the Governor of the State of Oregon amicable adjustment and subsequent development is expected. In addition to irrigated lands there is considerable land in this territory which can be dry farmed so as to produce certain crops.

MARKETS

One of the principal results which complainant and interveners urge would follow the proposed construction is the widening of available markets for the products of several sections. Southwestern

Idaho products could be moved by this route to northern California points, including San Francisco and adjacent points. Diversion privileges to Portland and points north thereof would also be available at Crescent Lake. The same result would follow as to the movement from northern California points to southwestern Idaho points.

Products of western Oregon would have a shorter route to the East and other sections of Oregon would have more direct rail connection with central Oregon. It is urged that present routes from western Oregon, particularly Portland, into central Oregon are unduly circuitous and that this would be overcome by the proposed construction.

ROUTING OF TRAFFIC

The distances between various originating and destination points, the routes presently available, and the extent to which shippers utilize the various open routes has an important place in the record. Between numerous points the proposed route would be shorter than existing routes, the difference varying considerably between different points.

TRAFFIC ESTIMATES OF COMPLAINANT AND INTERVENERS

Painstaking estimates as to the amount of traffic potentially and probably available have been made and submitted by the parties. In important instances they are in conflict, which can only be reconciled by remembering that they are estimates, with many problematical factors and variables upon which judgments may well differ.

It is urged that the development within the State as a whole which would follow this construction would more than compensate for the loss of traffic by existing facilities and that ultimately both the existing and proposed facilities would enjoy increased traffic. It is urged also that while present facilities in the Willamette Valley are sufficient to meet the needs of that section, the development which would follow the proposed construction would result in all-rail facilities within the State enjoying increased traffic.

In considering the statement that present facilities in the Willamette Valley are sufficient to meet the needs of that section it should be noted that the area of that valley constitutes less than 3 per cent of the area of the State. The Umpqua and Rogue River Valleys are also west of the Cascade Mountains. The latter valleys are very fertile and productive, yet they are not adequately served.

The estimates of available and potential traffic are given as to counties and will be so separated in the consideration which follows.

Estimates were submitted, on behalf of complainant and interveners, by a representative of the Oregon Agricultural College and United States Department of Agriculture, of the probable tonnage which will be made available for movement by reason of the agricultural development which will follow the construction of the

proposed extension. Estimates were also submitted of the portion of present tonnage of agricultural products, including livestock, which would move westbound over the proposed extension instead of existing routes. These estimates of tonnage per annum are summarized in the following tabulation.

Summary of agricultural tonnage by counties

County	Available now		Additional within five years		Additional after five years		Grand total	
	Tons	Cars	Tons	Cars	Tons	Cars	Tons	Cars
Malheur	23,050	1,241	11,531	689	64,357	3,274	98,938	5,174
Harney	8,801	650	3,700	144	20,335	789	32,836	1,583
Northern Lake	2,376	213	1,752	79	15,777	726	19,905	1,018
Klamath	493	44	240	16			733	60
Deschutes, Crook, Jefferson, Wheeler	3,487	352	250	15			3,737	367
Grant	1,944	159	486	40			2,430	199
Baker	500	33					500	33
Lane	25,984	1,018	18,778	674			44,762	1,692
Douglas	15,647	969	7,420	549			23,067	1,518
Linn	7,321	324	1,519	59			8,840	383
Benton	5,272	239	591	28			5,863	267
Lincoln	1,752	116	1,278	84			3,030	200
Coos and Curry	9,551	572	6,600	469			16,151	1,051
Total	106,178	5,928	54,145	2,826	100,469	4,789	260,792	13,543
Deductions [1]							37,205	1,902
Net grand total							223,587	11,641

[1] Deducting hay and feed requirements of western Oregon figures as originating in Malheur, Harney, and Lake Counties.

These estimates include the tonnage which it is anticipated will follow the completion of four irrigation and reclamation projects now in progress. New lands are to be developed by these projects and additional water furnished for old lands. The Owyhee project will reclaim approximately 80,960 acres; Vale project 24,700 acres; Jordan Valley project 9,500 acres; and the Warm Spring project 4,000 acres. The first two projects are by the Federal Government and the latter two by the State. All are located in eastern Oregon. When completed the Owyhee and Vale projects will represent an expenditure of approximately $20,991,505.

The estimated tonnage consists of beef cattle, sheep, lambs, hogs, horses, butter, potatoes, wheat, alfalfa, barley, oats, wool, fruits, dairy products, and miscellaneous products. No tonnage is included in the estimates which may follow irrigation by pumping although this was regarded by the witness as both a practical and probable method of irrigation and reclamation. The estimates do not include any tonnage which might originate on and move over the extension.

The available tonnage is that which it is considered will move over the proposed route after giving consideration to origin points, rates, mileage, and markets. In this study it is assumed that these commodities would be transported over the most direct routes and so

routed by the shippers. Shipments of broccoli originating in Douglas County on the line of the Southern Pacific are now routed by the shippers to Portland via Southern Pacific and then east over the Union Pacific lines. Similar routing over the proposed line is anticipated for the commodities and tonnage shown. The estimates are predicated upon the thought that for this amount of traffic the proposed line will afford the most direct and shortest route between origin and destination points and that this service will be of such value to shippers that they will exercise their privilege and route their shipments over this route. It is conceded, however, that the Southern Pacific may be able to control or influence the routing so that some of the anticipated tonnage for the proposed line may not be realized.

In regard to anticipated shipments of hay from Malheur County to the Coos Bay section it is conceded that for several years transportation of this hay has been embargoed, due to weevil. Research is being conducted with a view to eliminating this condition. When the alfalfa hay is converted to "meal" the weevil is destroyed and some quantities of this feed are shipped. Experiments are also being conducted to determine whether the weevil will live in the low altitude of western Oregon. If it is found that it will not this will probably result in lifting the present embargo. Harney County hay is not subject to the weevil.

It is anticipated that large quantities of perishable commodities going east from western Oregon will move over the proposed line to the present line of the Oregon Short Line and there be combined with special perishable trains which are given expedited movement.

The estimated tonnage shown for Lake and Harney Counties cover the so-called high-desert area.

It is anticipated that the Owyhee and Vale and other irrigation projects now under development will bring approximately 1,500 families to this territory. Practically all present irrigated lands are being utilized in the production of various commodities and livestock.

TIMBER

Oregon contains one-sixth of the standing timber in the United States. The territory through which the proposed railway would run is not primarily a timbered country, but there are very considerable stands of timber which could be opened up following the construction of this line. This timber is mature and will deteriorate rapidly. Harvesting of timber without transportation is impossible. In commenting on the standing timber in this area we said, in the *Oregon case*, at page 24:

"Of the 50,000,000,000 feet assigned to the territory east of the Cascades, the principal tracts are in the Klamath Basin and in the territories tributary to Lakeview and Bend. The testimony as to the

amounts in these several territories is conflicting, but according to the record as a whole the amount that may be considered tributary to Klamath Falls is approximately 24,000,000,000 feet, tributary to Lakeview about 3,000,000,000 feet, and tributary to the Deschutes River lines about 14,000,000,000 feet. There are other forests in eastern Oregon which have resources considerable in themselves, but relatively small as compared with the tracts in the western half of the State to which reference has been made. These figures do not include about 5,500,000,000 feet south of Oregon tributary to the proposed lines. *The entire eastern slope of the Cascade Mountains reaching to Lakeview on the south, is heavily timbered, and large stands would be tributary to the eastern end of the cross-State line.* Any additional traffic to or from territory on the south or over the Cascades on the west would have to be interchanged with the road operating the Natron cut-off, in the absence of arrangements for through movement. *Both in this section of the proposed cross-State line and the Natron cut-off, while partly in mountainous territory, are capable of originating considerable traffic in forest products.*" (Italics ours.)

HARNEY COUNTY.—While the lumber in northern Harney County is provided with transportation by the railway line to Burns, the circuitous route which must be followed in order to reach a market, either in California or via water transportation from Portland, is sufficient to discourage development there. The construction of the proposed extension will shorten the route to the tidewater at Portland by 183 miles and also open the California market to the lumber manufactured in northern Harney County.

CROOK, WHEELER, AND GRANT COUNTIES.—The timber in the Ochoco National Forest as well as the privately owned timber in eastern and southeastern Crook County, southeastern Wheeler County, and southwestern Grant County, will be found tributary to the proposed line.

KLAMATH COUNTY.—The timber in the Weschutes National Forest as well as the privately owned timber in northern Klamath County while tributary in part to the Southern Pacific and the Great Northern will be served in part by the proposed railway line.

It is impossible to determine exactly the quantity of timber in these areas. The following is an estimate applying to the National forests:

	Feet
Harney County (Malheur National Forest)	2,000,000,000
Crook, Wheeler, Grant Counties (Ochoco National Forest)	3,886,000,000
Klamath County (Deschutes National Forest)	2,513,000,000
Total	8,401,000,000

This estimate applies only to national-forest timber in that section of each county which appears to be tributary to the proposed railway line. There are large stands of privately owned timber in Crook,

Wheeler, Grant, and Klamath Counties. That portion of the privately owned timber in these counties which is contiguous to the national-forest timber which is tributary to the proposed extension will, of course, be tributary to that line. No estimate of the stands of privately owned timber are available.

MALHEUR COUNTY

Evidence relating particularly to present and prospective development of Malheur County was presented by the county agricultural agent on behalf of the court of that county. The area of the county is 9,883 square miles and 484,820 acres are being farmed by 1,331 farmers. Of the latter acreage 122,500 is under irrigation. The soil of this county is said to be very fertile as reflected by the statement below.

Crop	Number of yields averaged	Per acre yields		Average yield per acre
		Low	High	
Wheat	66	14 bushels	76 bushels	41.9 bushels.
Barley	35	15 bushels	80 bushels	48.1 bushels.
Oats	23	16.6 bushels	90 bushels	56.6 bushels.
Corn	40	25 bushels	do	59.7 bushels.
Alfalfa hay	61	1.4 tons	8.4 tons	5.1 tons.
Clover hay	7	1 ton	4.1 tons	2.4 tons.
Clover seed	12	3.3 bushels	8 bushels	5.4 bushels.
Potatoes	13	110 bushels	476.6 bushels	270.5 bushels.
Onions	4	125 sacks	425 sacks	268.7 sacks.
Apples	9	100 bushels	500 bushels	277 bushels.

Approximately half of the agricultural income of the county is from livestock and livestock products. Dairying is also carried on extensively. Extensive further development is possible through present and prospective irrigation and reclamation projects.

The present agricultural production of this county is estimated as set out below, based on 1927 shipments.

	Carloads		Carloads
Beef cattle	384	Barley	32
Sheep	736	Potatoes	141
Hogs	98	Onions	47
Dairy cattle	33	Prunes, green	138
Horses	28	Apples	565
Wheat	279	Seed	21

Although a considerable number of cattle have in the past been driven to Winnemucca, Nev., and there loaded for rail movement to San Francisco Bay points, this is unprofitable and impracticable to continue.

The thought of the witness was that the estimates previously referred to of the tonnage and production of Malheur County are too conservative to be representative and reflect the real situation. The same thought is expressed by witness testifying with respect to Lake and Harney Counties.

LAKE COUNTY

Large stands of timber are located within this county. The standing timber is estimated at 14 billion feet, of which 6 billion are in the national forest reserves. It is estimated that this timber will provide for the proposed line 2,000 carload shipments annually for a period of 50 years.

It is said that many years ago, when the line across the State was first surveyed, several hundred homesteaders settled in this section, but due partially to lack of transportation they had abandoned their claims, although many had built substantial homes.

Sections of this county have wells from which large quantities of water are pumped for irrigation and domestic purposes. Several illustrations are given and photographs submitted to show that splendid agricultural crops are being produced within this area. In other sections dry farming is said to be practicable. Rapid development is taking place in production of pasture feeds such as clover.

In a pamphlet issued by the Southern Pacific the following is included relative to Lake County:

Lake County is in South Central Oregon on the east side of the Cascade Mountains. This county is larger than the State of New Jersey and in it there are a large number of easily accessible homesteads open to entry. It contains 7,920 square miles and has but fourteen miles of railroad within the county. The county has a population of slightly more than 5,000 or about seven-tenths of a person to each square mile. Numerous lakes, most of them being at an elevation of more than four thousand feet, beautify the entire region. The county is rich in minerals, the soda deposit at Alkali Lake being 99 per cent pure. Stock raising, lumbering, and farming are the principal industries. Considerable fruit is raised in parts of the county."

HARNEY COUNTY

Although dry farming has been practically abandoned in this county, due partly to lack of transportation by which to get products to market at reasonable cost, this method would be used substantially if the proposed line is constructed.

During 1923 a total of 234 cars of cattle, 168 cars of sheep, 24 cars of wool, 11 cars of hogs, and 8 cars of horses were shipped from Crane. During the same year 15,000 head of cattle were driven overland to Winnemucca, Nev., and there loaded for rail shipment to San Francisco; also 2,000 head were driven to Klamath Falls. The distance from Harney County to Winnemucca, over which these cattle were driven is about 250 miles and driving cattle for this distance is regarded as unprofitable.

Harney County also has some mineral resources, but these are not relied on in estimating the probable earnings of the proposed line.

Although livestock is the principal industry in this county, there is much farming.

ALKALI LAKE

Alkali Lake, so called, lies approximately 20 miles south of the proposed line. It is estimated there are 3,000,000 tons of soda to be moved from this lake. This lake contains immense quantities of natural and pure sodium carbonate, which is used in many industries. It can be dried and is then ready for use without expensive chemical operations necessary in other operations or deposits of the country. There is great demand for this commodity and only transportation is lacking in the development of this resource. It is estimated that the possible production would amount to 25 cars per day and that the movement at the start would be from 2 to 5 cars daily.

In referring to mineral deposits in Lake County a pamphlet published and distributed by the Union Pacific system includes the following:

"There are also large deposits of minerals in this county, the most important of which lie in the northeastern part of the county near Alkali Lake. At the present time it is estimated that there are 800,000 tons of 99 per cent pure soda in these deposits."

UMPQUA AND ROGUE RIVER VALLEYS

These valleys are located in southwestern Oregon south of the Willamette Valley. According to the Southern Pacific, the valley of the Rogue comprises an approximate area of 2,300 square miles, of which there are over 500 square miles of rich valley floor and gentle hill slope. The soil of the valley is largely alluvial but also to be found is disintegrated lava and a soil of granite formation. Much of the soil is black and deep, with some lighter colored soil formed of disintegrated granite. The soil is ideal for strawberries and loganberries. The Rogue River Valley is best known for its pears, apples, and peaches, particularly pears.

North of the Rogue River lies the Umpqua Valley. This is really a succession of small and fertile valleys. The soil of the valleys is deep and sandy loam. On the benches and uplands the soil is of reddish clay. There is also a black adobe soil extremely rich in plant foods but difficult to work except at the right time. Yet this daobe soil produces a heavy yield of vegetables and from it come some of the best apples and pears produced in the Umpqua Valley. There are about 3,000 square miles of land in the Umpqua Valley.

Quicker transportation and shorter routes would be of much advantage in the transportation and marketing of the products of these valleys. A large part of the movement is under refrigeration and to eastern markets. The proposed construction would afford a shorter and more direct route from this territory to the east.

COOS BAY TERRITORY

Much importance is placed by complainants and interveners upon prospective through traffic originating in and destined to Coos and Curry Counties which would move over the proposed line. Coos County embraces Coos Bay and much importance is attached to the relation of the proposed line to the development of this port.

Lumber and lumber products furnish the principal traffic from these counties, although there is some traffic furnished through agricultural, dairying, and fishing activities. The estimates of the tonnage which might be expected from the agricultural development are embraced in the statement included above.

The harbor at Coos Bay is said to be the most improved port between Portland and San Francisco. The Federal Government has, since 1890, spent approximately $6,000,000 and the State approximately $1,000,000 in its development. Approximately $3,250,000 has been spent by the Federal Government during the past four years. There are no vessels running regularly into this port. A total of 264 foreign and Atlantic coast vessels cleared the port during the period 1922 to 1927 and carried approximately 497,000,000 board feet of logs and lumber. Tonnage for the port can not now be developed, because vessels now loading there must complete loading at some other port, due to present depth of the channel. It is proposed to remedy the latter difficulty but appropriations for the work have not as yet been made.

The Southern Pacific now has a branch line extending to Coos Bay but Curry County has no rail facilities. This branch has been in operation since 1916 but has never enjoyed sufficient traffic to utilize the facilities to anything like capacity.

The hope of witnesses representing this territory is that if the Union Pacific constructs the extension to Crescent Lake, it would through common user with the Southern Pacific, or its own construction, eventually extend its service west of the Cascade Mountains to Coos Bay, to the Rogue, Umpqua, and Willamette Valleys and adjacent territories. With this accomplished and with resulting competition and direct and shorter routes to and from the East, increased development is expected. The feeling exists that the territory and the port can not be developed until it is served by more than one railroad and by lines running in more than one direction.

High-grade lumber shipments by rail from Coos Bay territory and consisting principally of cedar, fir, and hemlock are given as follows:

	Carloads
1922	806
1923	2,011
1924	1,904
1925	2,800
1926	2,456

The bulk of these shipments, or about 80 per cent, went east to Chicago and Mississippi River territory. There is also considerable production amounting to several hundred cars annually of high-grade lumber products including battery separators, veneer products, and novelties. The bulk of green-lumber shipments are by water transportation. The standing timber ready to cut in Coos County is estimated at 30 billion feet, with a somewhat less amount in Curry County.

Central Oregon is capable of producing large quantities of hay and other feeds. Much of the acreage in Coos and Curry Counties is now devoted to producing hay and feeds for dairy cows. It is felt by representatives of that section that if means were provided by the proposed construction for direct movement of these feeds into the Coos Bay country the acreage therein now devoted to producing such feeds could be devoted to pasture and many more dairy cows maintained and the production of dairy products greatly increased.

Evidence was offered on behalf of the Chamber of Commerce of Portland tending to show that the development of Oregon is being held back due to the absence of adequate transportation and that the proposed construction would materially assist in remedying this condition.

The following statement reflects the development with respect to farms during the period 1920 to 1925, and was offered as showing that development is practically at a standstill.

County	Area in square miles	Population, U. S. Census, 1920	Number and average acreage, farms		Total farm area	Total area in acres	Per cent in farms	
			Farms	Acreage			1925	1920
Malheur	9,883	10,907	1,330	364	484,800	6,325,120	7.7	7.4
Harney	9,933	3,992	681	1,102	689,338	6,357,120	10.8	8.3
Grant	4,520	5,496	591	1,265	758,948	2,892,800	26.2	26.0
Lake	7,920	3,991	478	1,014	484,676	5,068,800	9.6	10.4
Crook	2,934	3,424	561	817	448,316	1,877,760	23.9	29.6
Klamath	5,999	11,413	789	431	338,968	3,839,360	8.9	9.3
Deschutes	3,065	9,622	670	162	108,629	1,961,600	5.5	7.4

The number of farm owners decreased between 1920 and 1925 in Malheur County 89, Grant County 111, Lake County 65, Crook County 152, Klamath County 185, Deschutes County 83. There was an increase of 69 in the number of farm owners in Harney County during the same period.

On the basis that the line would serve territory extending 50 miles on each side thereof, the area which would benefit from the construction is summarized as follows: Harney County 7,000 square miles, Lake, Crook, and Deschutes Counties 4,900 square miles, Klamath County 800 square miles, total 12,700 square miles. The line would also render of increased benefit and value the present rail mileage in Malheur County.

Emphasis is placed upon the decrease in mileage between Portland and various trading centers in surrounding territory that would result from the proposed line. The greater development of the States of California and Washington as compared with Oregon is attributed by several witnesses to the greater development of rail transportation within the former States.

CAR SUPPLY

Severe car shortages have many times retarded industrial activity and development in the State of Oregon. The commercial prosperity of the State is so dependent upon the marketing of its products that it quickly responds to any slackening in movement. The conditions which bring about such situations and the results which follow were described in detail in our report in the Oregon case, *supra*, and it is not necessary to repeat them here. There we said, "The Natron cut-off will mitigate, but can not entirely avoid the recurrence of, conditions of this character." The construction of the proposed extension would greatly relieve car shortages by the avoidance of the long haul by present routes and by making available the supply of cars of the Union Pacific system.

SOUTHERN IDAHO

Data were submitted by the Public Service Commission of Idaho to show the advantage to shippers and receivers of freight in 10 of the counties in southwestern Idaho which would follow the construction of the proposed extension. The data relate principally to the traffic orignating in and destined to points in these counties and it is assumed that all of the present all-rail movement between these Idaho points and San Francisco, Calif., and points adjacent thereto, would be over the proposed extension and that more expedited and direct service would thereby be afforded. The distance to San Francisco would be shortened approximately 400 miles as compared with present routes. Included in the data are figures showing the number of carloads of various commodities originating and destined to points in these counties. Considerable importance is attached by the witnesses for this intervener to the development of roads within Idaho, the number of automobiles used thereon, and the expected replacement of worn-out automobiles by automobiles shipped into the territory from San Francisco. It is said that cars are shipped knocked down to assembling plants in California and there assembled and reshipped. It is anticipated that this traffic would move via the proposed extension.

The following summary shows the number of carloads of freight received by the O.-W. R. & N. at Huntington, Oreg., for westbound movement and the witness surmises that most of this movement is to coast points:

	Carloads
1921	31,610
1922	38,636
1923	38,575
1924	39,879
1925	39,675
1926	40,615
1927	42,276

The tonnage and number of carloads originating on the lines of the Oregon Short Line in Idaho during the period from 1913 to 1927 were as follows:

Year	Tonnage	Carloads	Year	Tonnage	Carloads
1914	441,630	(1)	1921	2,033,013	65,921
1915	(1)	(1)	1922	2,085,885	75,294
1916	1,463,827	(1)	1923	2,542,810	93,428
1917	1,889,756	(1)	1924	1,968,393	75,565
1918	2,220,003	(1)	1925	2,387,638	84,168
1919	2,172,522	(1)	1926	2,346,833	84,719
1920	2,402,941	77,215	1927	2,384,588	85,821

[1] Not available.

It is stated that San Francisco would provide a market for much of the dressed poultry, eggs, butter, and various other commodities produced in southwestern Idaho if adequate and expeditious rail service was provided.

The following shows the number of carloads originating in the 10 southwestern counties of Idaho during the period 1921 to 1927:

	Carloads
1922	12,604
1923	15,755
1924	10,890
1925	13,304
1926	12,934
1927	14,852
Total	93,355

These carloads consisted of the commodities shown in the following:

Commodity	1921	1922	1923	1924	1925	1926	1927	Total carloads
Barley	18	10	20	129	42	34	31	284
Corn	11	12	8	18	54	24	26	153
Oats	16	55	51	69	141	87	95	514
Wheat	1,055	1,207	529	525	921	1,546	1,105	6,888
Flour	358	487	425	412	350	459	581	3,072
Bran	89	82	55	75	67	135	92	595
Other mill products	31	35	42	27	76	16	31	260
Hay	865	504	610	409	350	207	476	3,421
Apples	3,749	2,242	4,497	2,054	4,479	3,431	4,909	25,361
Fruit, dried	29	32	38	41	18	34	50	242
Prunes	1,493	1,135	1,728	566	833	1,145	1,104	8,004
Canned goods	25	12	14	14	54	40	40	199
Potatoes	2,031	1,981	2,429	1,746	1,287	971	979	11,424
Other vegetables	291	761	865	463	562	417	578	3,937
Other green fruits	31	128	249	30	21	67		526
Cattle	1,251	1,084	1,511	1,514	1,507	1,463	1,394	9,724
Hogs	150	271	422	596	347	405	482	2,673
Horses and mules	69	81	111	120	107	122	135	745
Sheep	1,724	2,485	2,151	2,082	1,600	1,767	1,803	13,612
Eggs [1]					131	186	208	525
Poultry [1]					75	87	113	275
Butter [1]					275	281	348	904
Cheese [1]					7	8	2	17
Total	13,286	12,604	15,755	10,890	13,304	12,934	14,582	93,355

[1] No record for 1921 to 1924.

The destinations of the above shipments are not given but the witness felt that much of this traffic could be sold to better advantage at California points, especially San Francisco, and that the tonnage and output of these Idaho counties could be greatly increased if a more direct and shorter route was provided through the construction of the proposed line.

The record also shows that there is considerable movement of necessaries into these 10 southwestern Idaho counties from the west, and it is felt that some of this traffic would move over the proposed line. As population increases the movement of both inbound and outbound commodities would increase. The following shows the population, by counties, in 1910, 1920, and 1927:

Idaho census, 10 southwestern counties

County	1910, U. S. Government	1920, U. S. Government	1927, Rand McNally estimate	County	1910, U. S. Government	1920, U. S. Government	1927, Rand McNally estimate
Ada	29,088	35,213	37,423	Payette		7,021	7,627
Adams		2,966	3,077	Valley		2,524	2,742
Boise	5,250	1,822	1,979	Washington	11,101	9,424	9,775
Canyon	25,323	26,932	29,256				
Elmore	4,785	5,087	5,197	Counties, total	79,591	102,110	108,987
Gem		6,427	6,981				
Owyhee	4,044	4,694	4,930	State of Idaho	325,594	431,866	534,000

The witness anticipates that the entire all-rail movement to San Francisco territory from these 10 counties would be over the proposed line if constructed.

Much importance is attached by the Idaho commission to the irrigation development projects now under construction and those anticipated, and to the added products that will be available for movement if suitable rail facilities and outlets to the Pacific coast are obtained. The development of southwestern Idaho since 1890 is described in considerable detail by the record. This section looks principally to California for markets.

Irrigation projects have aided in the development of lands in southwestern Idaho as indicated by the following summary:

Area irrigated in 1902; area enterprises capable of irrigation, 1920, in the 10 southwestern counties of Idaho

Watershed	Counties	Area irrigated, 1902	Area enterprises capable of irrigation, 1920
		Acres	*Acres*
Owyhee River	Owyhee	0	11,760
Boise River	Ada	84,438	368,854
Payette River	Boise, Valley, Gem, and Payette	50,893	117,011
Weiser River	Adams and Washington	26,769	69,718
Snake River (Gem district)	Owyhee	0	20,000
Succor Creek	Owyhee	1,000	1,500
Camas Creek	Elmore	4,107	46,190
Bruneau River	Owyhee	12,862	23,011
Little Salmon River	Adams		
Reynolds Creek	Owyhee	3,000	3,000
Sinker	Owyhee	500	2,500
Total		183,569	663,544

Practically all, if not all, of the above acreage is now producing. The dry land farmed in southwestern Idaho in 1927 is shown as follows:

	Acres		Acres
Ada County	0	Payette County	23, 583
Adams County	27, 830	Valley County	53, 961
Boise County	11, 576	Washington County	82, 869
Elmore County	11, 944		
Gem County	9, 546	Total dry land	221, 309

The total of the dry land and irrigated land now producing is 884,653 acres.

The investment in irrigation projects in this territory is approximately $27,584,676. The value of the farm property in these 10 counties is given as $102,714,968, as of 1925, and this covers 9,931 farms. The value of the livestock on these farms in 1925 was estimated to be $12,867,173, and the average of all crops per year is estimated to be $33,788,792.

The total area of farm land in the 10 southwestern Idaho counties, irrigated, dry land, area soon to be irrigated, and area susceptible of irrigation is given as follows:

	Acres
Present irrigated land	663, 344
Area soon to be irrigated	75, 858
Area susceptible of irrigation	720, 500
Dry land farmed	221, 309
Total	1, 681, 011

The production of principal crops in the 10 counties is given as follows:

Commodity	1910	1920	Commodity	1920	1920
Corn, bushels	52, 371	347, 680	Barley, bushels	249, 194	325, 007
Potatoes, bushels	468, 831	887, 896	Alfalfa, tons	298, 942	635, 751
Apples, bushels	46, 517	2, 566, 395			
Wheat, bushels			Total	3, 043, 416	8, 265, 539
Oats, bushels	1, 101, 617	460, 535			

The opinions of the witnesses for the Idaho commission were that California constitutes the principal market for many Idaho products and that the proposed line would aid materially in getting their products to those markets in the shortest time and with less expense to the carriers and to the shippers due to shorter routes thereby made available. In his way it is hoped not only to market more of present production but to increase materially the demand for Idaho products and thus make practicable substantial increases in production. It is said that at present the volume of production and variety of commodities is dependent largely upon ability to dispose of the products at the markets. The present originating territory for many commodities and products moving to California points is considerably farther east than Idaho. The same commodities being produced in Idaho, and potential production being much greater than

present production, it is urged that the volume of these products moving to California from Idaho could be greatly increased if shorter rail routes were provided.

The principal markets now available for southwestern Idaho livestock are Portland and Seattle. Some shipments go to California but are limited due to heavy shrinkage losses and expense of feeding en route caused by time consumed over present routes. The demand for livestock at Portland is limited and the market is often oversupplied. The return from the sale of livestock depends upon the condition in which they arrive at the market, and it stated that often stock classed as "fat" when shipped are, due to shrinkage, reduced to "feeder" upon arrival at market. The loss due to shrinkage and extra feeding is estimated from $65 to $68 per car of stock for each added 400 miles the shipment moves on the longer hauls. The markets at Los Angeles and San Francisco, especially the latter, must be looked to by southwestern Idaho producers. The shorter route over the proposed line would be of great value in making these markets available and bringing them within permissible shipping distance.

It is suggested that livestock is now shipped to Portland and Seattle from as far east as Nebraska, but it was explained that this is done by buyers to break the market and lower the price to be paid and not because it is practicable or desirable to ship stock such long distances.

Idaho is said to have abundant feeding territory, and it is expected that much traffic will be afforded the proposed line through the use of Idaho feeding territory for feeder cattle being moved toward the markets from neighboring sections. The proposed line would permit the fattening of stock in southwestern Idaho and then quick movement to the western markets. The proposed line would also afford to shippers means of diverting shipments either north or south when reaching the north and south lines in western Oregon so as to reach the best markets.

The manager of a large cooperative creamery located at Payette, Idaho, testified as to the advantage which would accrue if the proposed line should make it possible for shipments of creamery products to be sent directly to San Francisco instead of over the present circuitous routes. A total of 3,455 farmers are interested in this creamery. An average of two cars per week of butter are now shipped, and the total shipments during 1927 amounted to 3,412,537 pounds. The California cities provide ample markets for greatly increased shipments, and the shorter route via the proposed line would assist materially in making it possible to take advantage of these markets. Considerable shipments of creamery products, poultry, and eggs are also made. All of these shipments move under ice and expedited movement is especially important.

Data were submitted to show the substantial development of southwestern Idaho in the production and shipment of butter, poultry, eggs, and other products of like nature.

During 1927 there was a total of 12,684 cars of agricultural products originated in the 10 southwest counties of Idaho. It is estimated that 3,028 cars of this production would move via the proposed line. This movement is estimated as follows:

Commodity	Cars loaded	Estimate of cars to move via proposed railroad	Commodity	Cars loaded	Estimate of cars to move via proposed railroad
Barley	31	7	Hogs	484	240
Corn	26	6	Horses and mules	135	65
Oats	95	20	Sheep	1,803	600
Wheat	1,105	280	Eggs	208	104
Hay	476	47	Poultry	113	67
Apples	4,909	490	Butter	348	174
Potatoes	979	98			
Vegetables	578	180	Total	12,684	3,028
Cattle	1,394	650			

Officials of the State of Idaho are of the opinion that their production will continue to increase by reason of better farming methods, diversified farming, dairying, better feed, water, and marketing.

BRIDGE OR DIVERTED TRAFFIC

The objects of complainants and interveners' requests are (1) reduction of distance to eastern markets for the greater part of western Oregon, (2) opening to settlement of a vast area in central Oregon which can not be brought into use until rail service is provided, and (3) reduction of distance from southeastern Oregon and southwestern Idaho to and from Pacific coast markets. Freight destined to Union Pacific points is now hauled from Eugene through Roseville, Calif., to Ogden, Utah, a distance of 1,194 miles. The Southern Pacific's share of the revenues is, of course, much larger than it would be if the traffic was interchanged at Crescent Lake, which is only 96 miles from Eugene. It is assumed by complainant that the construction of the Alturas connection by the Southern Pacific would reduce the distance but that the divisions would be unchanged.

Computations were submitted by complainant tending to show that the saving which can be made on the haul via the proposed line will be sufficient to make interchange at Crescent Lake more profitable to both the Southern Pacific and Union Pacific lines than the present interchange between these lines at Ogden. It is urged that divisions of present joint rates can be made that, when compared with costs or expenses incurred, net earnings by the Southern Pacific on the shorter haul will equal what it could or does earn via either the Alturas or Roseville route and at the same time there would remain sufficient revenue for the Union Pacific lines to make their net earnings per mile greater on the haul from Crane to Omaha, than at present from Ogden to Omaha.

The cost study submitted by complainant in support of the above statements is based upon the generally recognized fact that other things being equal a decrease in the length of haul results in a decrease in transportation costs. The study also recognizes that certain expenses vary with the volume of traffic moved over the line while other expenses do not. The former are referred to as "direct" expenses and the latter "indirect" expenses. Detailed consideration was given the various accounts and an approximation arrived at as to each item of expense to show the proportion of such expense to be classed as direct and indirect respectively. The analysis is primarily based on the operating expense accounts of the O.-W. R. & N. and Oregon Short Line for the year 1925. Separation is also made of operating expenses between line and terminal. The study includes consideration of the various classes of service, such as carload and less-than-carload movement, operating divisions and peculiar conditions encountered in operating thereover, main and branch line service, loaded and empty movements, and weight and car loading of commodities hauled.

Final unit costs are arrived at for the entire movement of the various commodities originating in western Oregon and moving to Ogden via the various routes, including the proposed route over the line which the carriers are asked to construct. These unit costs are applied to all tonnage or shipments originated by the Southern Pacific in certain western Oregon counties, during the year 1926, and which moved through Ogden, Utah. The savings which would result from moving this tonnage over the proposed line as compared with other routes via Alturas or Roseville are set up. By reference to the map it will be seen that shipments routed via the proposed line and Oregon Short Line would reach the Ogden-Omaha line of the Union Pacific at Granger, Wyo.

The total estimated annual saving possible by using the proposed route as compared with the present Roseville route is $2,174,024, and as compared with the contemplated route via Alturas is $859,781.

Assuming that the tonnage originated by the O.-W. R. & N. on the line running north from Bend and destined to eastern points would, through trackage arrangements over the line south of Bend, be moved south to and then east over the proposed line an additional saving to the Union Pacific lines on loaded and empty movement of $135,607 is expected as compared with present route via Sherman, and a saving of $145,607 is expected as compared with the contemplated route via Alturas.

The following illustration is given of the division of joint rates between the carriers, as compared with the cost of movement over the different routes, which would be necessary in order to avoid loss to the Southern Pacific and to compensate the Union Pacific lines for service performed. The illustration covers a car of fir lumber (1) originating at Eugene and moving to Omaha and (2) originating at Eugene and moving via and beyond Omaha at present rates.

	Amount		Amount

Net per mile	.0406	Net per mile	.0297

The recommendations of complainant as to divisions of joint rates necessary to realize and carry into effect the proposed arrangement are as follows:

"Let the Union Pacific be required to build from Crane to Crescent Lake within a reasonable time, with the assurance that for a period of three years thereafter the joint rates established for interchange at Crescent Lake will be such as to give the Union Pacific about 85% of the saving over the existing route via Roseville as compensation for its investment, while the Southern Pacific would receive the remaining 15%, as an addition to its net revenues, without any additional cost.

"Let the order of the commission which requires the building of the Cross-State Line provide that whenever the Southern Pacific, after the expiration of the three-year period, completes the line from Klamath Falls to Alturas there shall then be established a new set of joint rates at Crescent Lake, the effect of which shall be to give the Southern Pacific net earnings on freight turned over to the Union Pacific at Crescent Lake equal to those which would be earned by it on delivery of that freight to the same carrier at Ogden, under the joint rates now existing.

"Let it also be required that the Southern Pacific shall thereafter deliver to the Union Pacific at Crescent Lake all freight which originates north or west of Crescent Lake, or within a reasonable distance south thereof, and which is destined to Ogden or points east."

Of the traffic exchanged with the Southern Pacific, there were only one-sixth as many cars of other commodities east and west bound together, as of lumber. On the average these commodities carry higher rates than lumber, therefore, it seems fair to take for the net earnings of the cross-State line on these commodities the same amount per car as on lumber. On westbound traffic it is as-

sumed that no empty haul is required. Net earnings are therefore taken as the same as on eastbound, less the cost of empty movement.

As for the Bend traffic, both the present and the proposed routes are entirely on the lines of the Union Pacific system, and the entire saving on both loads and empties may be therefore credited to the cross-State line.

Under the joint rates proposed for the 3-year period, the estimated increase in annual net operating earnings of the Union Pacific on traffic equal to that of 1926, if moved over the Crane cut-off, would be as shown on the following page.

Origin and destination	Commodity	Cars	Interchange at—			
			Ogden		Crescent Lake	
			Per car	Total	Per car	Total
Eugene to Omaha	Lumber	3,006	$34.25	$102,956	$120.76	$363,005

Total				1,035,196		1,053,513
Increase in net earnings by diversion to cross-State line						18,317

The preceding statements reflect earnings or savings which are anticipated by complainants on existing traffic alone. These were supplemented by estimates of earnings which are anticipated from increases in traffic which would result from the proposed construction, and from existing traffic which would be diverted to this route due to possible savings. The basis of these supplemental estimates are the estimates of potential traffic referred to herein and to the possible savings also previously considered.

	Diverted traffic		Traffic created		Total earnings
	Cars	Earnings	Cars	Earnings	
First year	30,628	$1,805,880	3,777	$134,996	$1,940,876
Third year	37,402	2,204,831	4,628	155,645	2,360,476
Fourth year	28,893	964,135	5,651	176,710	1,140,845
Fifth year	31,362	1,047,033	6,279	191,929	1,238,962

The above statement is based upon the assumption that the Alturas connection of the Southern Pacific will be completed in three years.

No earning is expected from passenger traffic over the proposed line, but it is anticipated that no deficit will result and that expense of passenger service will be fully sustained by that traffic.

The indirect operating expenses and taxes for the proposed line are estimated as $350,000. Assuming that operation over the line of the Great Northern south from Bend to the proposed line was arranged the estimated indirect expense and taxes to be paid amount to $55,000, making a total amount for indirect expenses and taxes for the proposed line of $405,800.

Summarizing the preceding statements, the net earnings and return of the proposed line for a 5-year period on Oregon traffic alone would be as follows:

Year	Net earnings		Indirect expenses and taxes	Return
	Freight	Passenger		
First	$1,940,876	$2,680	$405,800	$1,537,756
Second	2,150,676	2,680	405,800	1,747,556
Third	2,360,476	2,680	405,800	1,957,356
Fourth	1,140,845	2,680	405,800	737,725
Fifth	1,238,962	2,680	405,800	835,842
Total in 5 years				6,816,235

It is estimated by complainant that the total cost of constructing the line from near Crane to Crescent Lake, a distance of approximately 181 miles, will be approximately $9,000,000. Assuming that half-interest would be acquired in that portion of the Great Northern line from Bend to the proposed line at a cost of $908,000, the total cost would be $9,908,000. The total return and the per cent of return on investment for each of the first five years would be as follows:

Year	Return	Per cent	Year	Return	Per cent
First	$1,537,756	15.5	Fourth	$737,725	7.4
Second	1,747,556	17.7	Fifth	835,842	8.4
Third	1,957,356	19.8			

The foregoing statements do not include revenues from traffic moving to and from points in southwestern Idaho over the proposed line. These revenues are estimated by complainant as follows:

Year	Eastbound	Westbound	Total
First year	$65,745.47	$158,531.21	$224,276.68
Second year	74,047.25	176,883.65	250,930.90
Third year	82,219.31	176,883.65	259,102.96
Fourth year	90,521.10	176,883.65	267,404.75
Fifth year	98,683.06	195,236.08	293,919.14

An analysis of probable revenues for the proposed line, including Idaho traffic, from a rate standpoint, was also submitted by complainant, as follows:

Year	Bridge traffic	Traffic to and from points on line	Idaho traffic	Total
First	$1,227,829.04	$255,510.44	$224,276.68	$1,707,616.16
Second	1,368,129.25	270,134.26	250,930.90	1,889,194.41
Third	1,508,345.44	295,069.56	259,102.96	2,062,517.96
Fourth	1,152,570.30	345,708.54	267,404.75	1,765,683.59
Fifth	1,235,542.50	388,850.81	293,919.14	1,918,312.45

POSITION OF CARRIERS

The general position of the O.-W. R. & N. is that the entire proposition of building a line across central Oregon to a connection with the Southern Pacific is economically unsound; that the nature and resources of the territory are such as to prohibit development of sufficient traffic to sustain the line; that existing rail facilities are ample to properly take care of all needs of eastern and western Oregon and of southwestern Idaho; and that the Southern Pacific can not be expected to divert traffic to the cross-State line and thereby short haul itself.

The position of the Southern Pacific is similar to that of the O.-W. R. & N., and in addition it urges that as a matter of law it can not be compelled to divert traffic to the cross-State line when such diversion would result in short hauling itself; that complainant's computations of alleged savings possible through such diversion are inaccurate; that large expenditures have been and are being made in the construction of additional rail facilities in western Oregon in order to properly serve that territory and to expeditiously handle the traffic and that such facilities are more than sufficient for present and prospective traffic.

The position of the Great Northern is embraced in the views set forth above.

While the Southern Pacific criticizes complainant's estimates of savings pos'ible through the use of the proposed extension and route, as compared with other routes, and further urges that it would not give to the proposed line any traffic, it is not reasonable to assume that where no loss to the Southern Pacific will result, complainant's plan, or some modification thereof, will not be carried out in the interest of efficient and economical management as contemplated by the act.

Defendants criticize the traffic estimates of complainant and interveners and contend that they are much too high. The traffic witnesses for complainant and defendants estimated that the revenues from traffic originating on and destined to points on the proposed line would be as follows:

Year	Complainant's estimate	Carrier's estimate	Year	Complainant's estimate	Carrier's estimate
First	$255,510.44	$98,010.00	Fourth	$345,708.54	$190,913.00
Second	270,134.26	107,248.00	Fifth	388,850.81	199,152.00
Third	295,069.56	182,600.00			

The probable revenues for the proposed line from traffic moving from and to points in southwestern Idaho were computed by complainant's traffic expert, as follows:

First year	$224, 276. 28
Second year	250, 930. 90
Third year	259, 102. 96
Fourth year	267, 404. 75
Fifth year	293, 919. 14

Defendants did not submit an estimate of the probable revenues for the proposed line from Idaho traffic. They do urge that the estimate of complainant is too high and that much of the revenues as used by complainant is from existing traffic and would be taken from the present earnings of the O.-W. R. & N. and Oregon Short Line.

The difficulty in estimating development which will follow the construction of an extension into this virgin territory is apparent. In neither the estimates of complainant nor defendants is any consideration given to the development which would follow short extensions or branches from the proposed construction. It is not reasonable to presume that such branches would not be constructed. Little attention has been given to traffic moving from the east to western Oregon and which would logically move via the proposed route. There is also substantial evidence that construction of feeder lines by other companies in western Oregon would follow construction of the proposed extension and that such lines would bring to the proposed line considerable traffic. When consideration is given to these matters we think complainant's estimates of probable traffic and revenues are lower than would actually follow after a reasonable development period.

The matter of establishing through routes and joint rates from western Oregon to the east via the proposed extension can not properly be disposed of except upon an adequate record dealing with all the facts relating thereto. We can not require the establishment of through routes and joint rates at this time because the line is not yet in existence. It does seem reasonable to assume that a substantial volume of western Oregon traffic will move to the east via the proposed line when consideration is given to the shortened mileage and the savings which it is shown can be brought about in transportation costs through the use of this route. After careful consideration of complainant and interveners' traffic and revenue estimates, and of defendants' criticisms thereof, we are firm in the belief that the extension would be a valuable asset to the Union Pacific system and would be an effective feeder for that system after a reasonable development period. At the same time the construction would bring about development in a vast territory. It would be of material benefit to the present Ontario-Burns branch.

It is not necessary in establishing that the extension is reasonably required in the interest of public convenience and necessity to show

that the extension would of itself, and considered as standing alone, earn sufficient revenues to make it profitable. The relation of the extension to the Union Pacific system and its possibilities as a developer of traffic for that system must be considered. We have recognized this principle in many cases. Thus in Construction of Extension by O.-W. R. R. & Nav. Co. (86 I. C. C. 265) we said of the extension of the Ontario-Crane branch from Crane to Burns, a distance of approximately 30 miles:

"It is not expected that the extension will be profitable in itself, but as a feeder of the Union Pacific system it will probably earn a fair return on the investment."

The estimated cost of the construction in that case was $1,076,025. The application for certificate was filed by the O.-W. R. & N. and the certificate was issued to the O.-W. R. & N. although it is apparent that only as a feeder for the Union Pacific system could the extension be expected to earn a fair return on the investment. In that case we further said:

"The cost of construction will be financed from current funds or by advances to be made by the Union Pacific Railroad Company which owns all the capital stock of the Oregon Short Line Railroad Company."

The situation in the instant case is very similar to that involved in the case cited, the difference being one only of degree. There appears no reason for requiring a greater or different showing of public convenience and necessity under paragraph 21, than under paragraph 18 of section 1, for the language is practically identical.

In Construction of Natron Cut-Off by Central Pacific (82 I. C. C. 185) we authorized construction which it was estimated would cost, without equipment, $16,182,616. There we said:

"* * * There is no land under cultivation and the estimate of traffic submitted does not indicate that any important agricultural development is expected. The territory is sparsely inhabited, the total estimated population of the new territory to be served being 200.

* * * * * * *

"The primary purposes of the proposed construction are to develop the local traffic which, it appears, will be almost wholly dependent on the exploitation of the timber resources, and to complete an alternate line between Weed and Springfield Junction, a distance of 296 miles, over which through traffic can be handled more economically than by the existing line."

The convenience and necessity of the public depends not at all upon the willingness or unwillingness of the carriers to provide the facilities or render the service sought. The requisites set forth in the statute are practically identical whether the construction is to be voluntary or compulsory. Case after case might be cited where applications of the carriers for certificates covering construction un-

der less favorable circumstances, as related to probable traffic, revenues, and public benefit, than are present in this case have been granted. There can be no justification for granting requests of the carriers under given circumstances and under similar or more favorable circumstances denying appeals of the people for relief and for a reasonable chance to develop a great State. There can be no better criterion or guide to follow in determining what the carriers, including defendant carriers, consider a prudent investment which is justified in the interest of public convenience and necessity than the instances where certificates have been sought and granted authorizing construction of rail extensions.

EXPENSE INVOLVED

Complainant estimates that the cost of construction of the extension as proposed would be approximately $9,000,000, or about $49,000 per mile. Defendants estimate that the cost of constructing and equipping the extension would be $11,717,677, or approximately $63,340 per mile. Complainant estimates that operating expenses would be $350,400 per annum. The question is presented whether this expense will impair the ability of the carrier to perform its duty to the public.

The annual report of the Union Pacific system for the year ended December 31, 1927, made by the board of directors to the stockholders of the Union Pacific Railroad Company, shows the following:

	1927	1926
1. Capital stock outstanding in the hands of the public:		
Common stock	$222,293,100.00	
Preferred stock	99,543,500.00	
Total	321,836,600.00	
2. Total funded debt	411,317,075.00	
3. Excluding all offsetting accounts between the Union Pacific Railroad Company, Oregon Short Line Railroad Company, Oregon-Washington Railroad & Navigation Company, and Los Angeles & Salt Lake Railroad Company:		
(a) Net income from transportation operations	39,483,390.26	$42,100,143.04
(b) Total income	57,919,019.83	59,229,806.61
(c) Fixed and other charges	18,253,784.61	18,245,057.43
(d) Net income from all sources	39,665,235.22	40,984,749.18
(e) Dividends on preferred stock	3,981,740.00	3,981,740.00
(f) Sinking-fund requirements		5,676.00
(g) Surplus for common stock of Union Pacific Railroad	35,683,495.22	36,997,332.54
(h) Per cent earned on par value	16.05	16.64
(i) Dividends on common stock	22,229,160.00	22,229,160.00
(j) Surplus, transferred to profit and loss	13,454,335.22	14,768,172.54

It is clear from the above that the expense involved by the construction of the extension would not impair the ability of the carrier or carriers involved to perform their duty to the public.

The suggestion is made by certain interveners that any extension west from Crane should run north of the proposed location and through Prineville and Bend. The location proposed by the Oregon commission follows the survey of the carrier and the evidence shows

that all things considered it is the most desirable and practicable location.

We find that an extension of the rail line of the O.-W. R. & N., now terminating at or near Burns, Oreg., from, or near, a station thereon designated as Crane, Oreg., to a connection with the Cascade line of the Southern Pacific at, or near, Crescent Lake, Oreg., by the Oregon-Washington Railroad & Navigation Company, is reasonably required in the interest of public convenience and necessity and that the expense involved therein will not impair the ability of the carrier or carriers involved to perform their duty to the public, and that the facts justify an order requiring such extension to be constructed. An appropriate order will be entered requiring the Oregon-Washington Railroad & Navigation Company to construct the extension substantially as proposed by complainant and authorizing the Union Pacific Railroad Company to participate therein.

As previously shown, the O.-W. R. & N. is owned by the Oregon Short Line, which, in turn, is owned by the Union Pacific. All eastbound traffic moving from and over this extension will move practically the full length of the latter carriers. Under such circumstances it would be inconsistent and contrary to fairness to consider the new construction with relation only to the O.-W. R. & N., and apart from the Oregon Short Line and the Union Pacific. In view of these facts, it is expected that the cost of the construction will be financed by the Union Pacific in a manner similar to that which it voluntarily followed in the construction of the Burns extension previously referred to.

BRAINERD, Commissioner, dissenting:

While the construction of the proposed line of railroad might be of some convenience to the public, I am of the opinion that the commission has no authority to require its construction. In the *Los Angeles Passenger Terminal case*,[1] recently decided by the Supreme Court, Chief Justice Taft said:

"If Congress had intended to give an executive tribunal unfettered capacity for requisitioning investment of capital of the carriers and the purchase of large quantities of land and material in an adverse proceeding, we may well be confident that Congress would have made its meaning far clearer and more direct than in the present meager provisions of the transportation act."

A like observation is appropriate here. For these reasons I am obliged to dissent from the decision of the majority herein.

PORTER, Commissioner, dissenting:

While as at present advised, I am persuaded we have authority to compel the construction of the line of railway involved in this case, I am not convinced we should make such an order upon the record

[1] Interstate Commerce Commission v. United States ex. rel. City of Los Angeles. (Supreme Court of the United States, November 25, 1929, page 9.)

now before us. I appreciate that the Supreme Court in *Dayton Goose Creek Ry. Co.* v. *U. S.* (263 U. S. 456, 478) has said that the law now puts the railway systems of the country more completely than ever under the fostering guardianship and control of the commission, nevertheless, as the same court has said in *Southwestern Tel. Co.* v. *Pub. Serv. Comm.* (262 U. S. 276, 289) the State is not the owner of the property and is not clothed with the power of management incident to ownership.

Those charged with the management of the property have refused to construct the railway. They insist the large expenditure that would be required, the taking on of the unprofitable operation that would follow, and the fact that the new line must look almost entirely to traffic diverted from other lines operating far below their present capacity, do not justify the construction. This should have great weight with us and give us pause.

The extraordinary character of the power lodged with us to say to a carrier against its will that it shall construct a piece of railway 187 miles in length, costing from nine to twelve millions of dollars, should require a clear and convincing showing of the public necessity requiring it, and of the probable favorable results therefrom, before we should exercise it. I am not convinced that such a showing has been made in the record we have here, and hence, I am unable to agree with the report.

FARRELL, Commissioner, dissenting:

I am unable to concur in the views of the majority, because I find nothing in the interstate commerce act which appears to me to clothe us with authority to require a carrier subject to the act to construct a new line of railroad. According to my understanding, the provisions relied upon in this connection are contained in paragraph (21) of section 1 of the act, wherein we are authorized to require a carrier "to provide itself with safe and adequate facilities for performing as a common carrier its car service as that term is used in this act, and to extend its line or lines." That the term "facilities" as here used does not cover the construction mentioned is made clear by the definition of "car service" in paragraph (10) of said section, which reads:

"(10) The term 'car service' in this act shall include the use, control, supply, movement, distribution, exchange, interchange, and return of locomotives, cars, and other vehicles used in the transportation of property, including special types of equipment, and the supply of trains, by any carrier by railroad subject to this act."

And, in my opinion, the extension of lines referred to can not properly be construed as covering a new line of railroad, but must instead be confined to such extension as is necessary to enable the carrier to serve the public adequately with some railroad which has already been constructed and in territory which has already been occupied by the carrier.

Commissioner WOODLOCK dissents.

ORDER

At a general session of the Interstate Commerce Commission, held at its office in Washington, D. C., on the 3d day of December, A. D. 1929

No. 19680

PUBLIC SERVICE COMMISSION OF OREGON

v.

CENTRAL PACIFIC RAILWAY COMPANY; DESCHUTES RAILROAD COMPANY; Great Northern Railway Company; Northern Pacific Railway Company; Oregon Electric Railway Company; Oregon Short Line Railroad Company; Oregon Trunk Railway; Oregon-Washington Railroad & Navigation Company; Southern Pacific Company; Spokane, Portland and Seattle Railway Company; and Union Pacific Railroad Company

This case being at issue upon complaint and answers on file, and having been duly heard and submitted by the parties, and full investigation of the matters and things involved having been had, and the commission having on the date hereof, made and filed a report containing its finding of fact and conclusions thereon, which said report is hereby referred to and made a part hereof:

It is ordered that the Oregon-Washington Railroad & Navigation Company be, and it is hereby, notified and required to extend its line of railroad, now terminating at or near Burns, Oreg., from, or near, a station thereon designated as Crane, Oreg., to a connection with the Cascade line of the Southern Pacific Company at, or near, Crescent Lake, Oreg.

It is further ordered that the Union Pacific Railroad Company, which owns all of the capital stock of the Oregon Short Line Railroad Company, which in turn owns all of the capital stock of the Oregon-Washington Railroad & Navigation Company except 15 shares, be, and it is hereby, authorized to join in the construction and operation of said extension and to finance it from current funds or by advances.

It is further ordered that the extension hereby required to be constructed shall be commenced on or before July 1, 1930, and shall be completed and in operation before July 1, 1933.

It is further ordered that the Oregon-Washington Railroad & Navigation Company shall report to this commission, in writing, the commencement and the completion of such construction, within 15 days after such commencement and completion, respectively.

It is further ordered that the Oregon-Washington Railroad & Navigation Company when filing schedules establishing rates and

fares applicable on said line of railroad, shall in such schedules refer to this order by title, date, and docket number.

And it is further ordered that the Oregon-Washington Railroad & Navigation Company shall report to this commission as required by valuation order No. 24, effective May 15, 1928.

By the commission..

Stipulation to amend petition, etc.

Filed July 10, 1930

It is hereby stipulated by and between the petitioner herein, the United States of America, and the Interstate Commerce Commission, appearing by their respective solicitors, as follows:

I

That the original petition on file in this court and cause may be amended by the petitioner by interlineation as follows:

(a) Strike from line 31 on page 17, the figures "1914" and substitute therefor "1924."

(b) Strike from line 8 on page 41 the word "within" and substitute therefor the words "as great as."

(c) Strike from line 15 on page 41 the word "labor" and substitute therefor the word "lumber."

(d) Add the words "General Manager," following the signature of J. P. O'Brien on page 51.

II

That consent of the United States of America and the Interstate Commerce Commission be, and is hereby, extended to the petitioner for the filing by the petitioner in said court and cause, and without further or other notice to the United States of America or the Interstate Commerce Commission, of petitioner's supplemental petition herein, a copy of which has this day been served upon solicitors

for said respective parties and upon the original of which the United States of America and Interstate Commerce Commission by their solicitors have acknowledged services.

74a Dated, June 26, 1930.

Order allowing amendment of petition by interlination, and to file supplemental petition

Filed July 10, 1930

In accordance with the stipulation between petitioner, Oregon-Washington Railroad & Navigation Company, the United States of America, and the Interstate Commerce Commission, by their respective solicitors, this day filed in this cause, it is

Ordered that petitioner may amend by interlineation its original petition in this cause as follows:

(a) By striking from line 31 on page 17 the figures "1914" and substituting therefor the figures "1924."

(b) By striking from line 8 on page 41 the word "within" and substituting therefor the words "as great as."

(c) By striking from line 15 on page 41 the word "labor" and substituting therefor the word "lumber."

(d) By adding the words "General Manager," following the signature of J. P. O'Brien on page 51.

It is further ordered that petitioner may file in this cause its supplemental petition verified June 25, 1930, and served upon the respective solicitors for the United States of America and the Interstate Commerce Commission on June 26, 1930, and now tendered for filing.

Dated, this 10 day of July, 1930.

Supplemental petition

Filed July 10, 1930

To the Honorable Judges of the District Court of the United States for the District of Oregon:

Your petitioner herein, Oregon-Washington Railroad & Navigation Company, respectfully shows:

I

That on the 28th day of May, 1930, it filed its petition in this honorable court against the United States of America, and therein and thereby prayed that a decree be entered in said cause setting aside, annulling and suspending the order of the Interstate Commerce Commission described in said petition, a copy of which was attached as Exhibit B to said petition as a part thereof, and in which it was provided:

"It is ordered that the Oregon-Washington Railroad & Navigation Company be, and it is hereby, notified and required to extend its line of railroad, now terminating at or near Burns, Oreg., from, or near, a station thereon designated as Crane, Oreg., to a connection with the Cascase line of the Southern Pacific Company at, or near, Crescent Lake, Oreg.

"It is further ordered that the Union Pacific Railroad Company, which owns all of the capital stock of the Oregon Short Line Railroad Company, which in turn owns all of the capital stock of the Oregon-Washington Railroad & Navigation Company except 15 shares, be, and it is hereby, authorized to join in the construction and operation of said extension and to finance it from current funds or by advances.

"It is further ordered that the extension hereby required to be constructed shall be commenced on or before July 1, 1930, and shall be completed and in operation before July 1, 1933."

II

That since the filing of said petition in said court as aforesaid, and on the 19th day of June, 1930, said Interstate Commerce Commission, without the taking of any further testimony in said cause re-
79a ferred to in its said order and in said petition, modified its said order as follows and not otherwise, to wit:

"It is ordered that the order entered in this proceeding on December 3, 1929, which required that construction of the extension be commenced on or before July 1, 1930, be, and it is hereby, modified by postponing said date on or before which construction must be commenced to January 1, 1931."

III

That the matters complained of by petitioner in its said petition are in no respect changed or affected by said order of June 19, 1930, and petitioner and its properties remain exposed without remedy with respect thereto, all and singular as alleged in its said petition, unless it receive the relief therein prayed for.

Wherefore, petitioner prays that a decree be entered herein setting aside, annulling, and suspending said order of the Interstate Commerce Commission, as so modified, and that the defendant, its officers and agents, be perpetually enjoined from enforcing or attempting to enforce said order; that the defendant and its officers and agents be perpetually enjoined from instituting or prosecuting any action or proceeding to recover any penalty or penalties from the petitioner by reason of its refusal or neglect to comply with said order of the Interstate Commerce Commission, as so modified; that the said provision in paragraph 21 of section 1 of the interstate commerce act concerning the extension of the line or lines of carriers by railroad subject to said act as construed and applied by said Commerce Commission as more fully appears in said petition and in Exhibit B thereto attached be declared unconstitutional and void, and that petitioner have such other and further relief in the premises as justice and equity may require.

OREGON-WASHINGTON RAILROAD
& NAVIGATION COMPANY,
By J. P. O'BRIEN, *General Manager.*

[Title omitted.]

Second supplemental petition

Filed Jan. 20, 1931

To the Honorable Judges of the District Court of the United States for the District of Oregon:

Your petitioner herein, Oregon-Washington Railroad & Navigation Company, respectfully shows:

I

That on the 28th day of May, 1930, it filed its petition in this honorable court against the United States of America and therein prayed that a decree be entered in said cause setting aside, annulling, and suspending the order of the Interstate Commerce Commission described in said petition, a copy of which order was and is attached as Exhibit B to said petition.

II

That thereafter and on the 19th day of June, 1930, said Interstate Commerce Commission, without the taking of any further testimony in said cause referred to in its said order and in said
83a petition, modified said order by postponing the date on or before which commencement of construction by petitioner was and is required by the terms of said order from July 1, 1930, to January 1, 1931, and that said order of the said Interstate Commerce Commission complained of in said petition was not changed or modified in any other respect.

III

That on the 20th day of December, 1930, without the taking of any further testimony in said cause referred to in said order and in said petition, the said Interstate Commerce Commission again modified its said order as follows and in no other respects, to wit:

"Upon further consideration of the record and request of the United States District Court, District of Oregon, in which is pending the case of Oregon-Washington Railroad & Navigation Company *v.* United States, E-9113:

"It is ordered that the order entered in this proceeding on December 3, 1929, which required that construction of the extension be commenced on or before July 1, 1930, which date was subsequently postponed to January 1, 1931, be, and it is hereby, modified by further postponing said date on or before which construction must be commenced to April 1, 1931."

IV

That the matters complained of by petitioner in its said petition are in no respect changed or affected by its said order of December 20, 1930, and petitioner and its properties remain exposed without remedy with respect thereto, all and singular as alleged in its said petition, unless it receive the relief prayed for in said petition.

Wherefore, petitioner prays that a decree be entered herein setting aside, annulling and suspending said order of the Interstate Commerce Commission, as so modified, and that the defendant, its officers and agents, be perpetually enjoined from enforcing or at-
84a tempting to enforce said order; that the defendant and its officers and agents be perpetually enjoined from instituting or prosecuting any action or proceeding to recover any penalty or penalties from the petitioner by reason of its refusal or neglect to comply with said order of the Interstate Commerce Commission, as so modified; that the said provision in paragraph 21 of section 1 of the interstate commerce act concerning the extension of the line or lines of carriers by railroad subject to said act as construed and applied by said Commerce Commission as more fully appears in said petition and in Exhibit B thereto attached be declared unconstitutional and void, and that petitioner have such other and further relief in the premises as justice and equity may require.

Order granting Southern Pacific Company leave to intervene as party plaintiff

Filed September 16, 1930

This cause coming on to be heard upon the verified petition of Southern Pacific Company for leave to intervene herein, and the

court having read the same and finding the allegations of the petition with respect to the right to intervene to be true, and being fully advised in the premises, and good cause appearing therefor,

It is ordered, adjudged, and decreed, that the prayer of said petitioner, Southern Pacific Company, for leave to intervene be, and the same is hereby granted, and that said petition, Southern Pacific Company, be and it hereby is given leave to intervene herein and to serve and file its petition in intervention, and that it be and it hereby is made a party plaintiff to this suit, with the right hereafter to participate therein as fully and with the same effect as if it had been named as a plaintiff in the petition or bill of complaint in this suit.

Dated, this 16th day of September, 1930.

Petition in intervention of Southern Pacific Company

Filed September 18, 1930

To the Honorable Judges of the District Court of the United States for the District of Oregon:

Your petitioner, Southern Pacific Company, files this, its petition in intervention, in the above-entitled court and cause, to enjoin, set aside, and annual an order of the Interstate Commerce Commission, made and entered in docket No. 19680, on December 3, 1929, and in support of its petition your petitioner respectfully alleges and shows:

I

Heretofore and on, to wit, the 24th day of May, 1927, the Public Service Commission of Oregon filed its complaint with the Interstate Commerce Commission, naming as defendants, among others, your petitioner, Southern Pacific Company, and Central Pacific Railway Company. In and by said complaint said Public Service Commission of Oregon prayed for an order requiring one or more of the defendants named in said complaint to construct a line of railroad between Crane or Harriman, Oregon, on the east, and Crescent Lake or some adjacent point on the line operated by the Southern Pacific Company, on the west; that said cause was heard before said Interstate Commerce Commission, and on the 3rd day of December, 1929, said commission made and entered its report and order in said cause, known as docket No. 19680, by the terms of which

order Oregon-Washington Railroad & Navigation Company,
90a the petitioner herein, was required to construct 185 miles of railroad through central Oregon from a point on the Ontario-Burns line of railroad of said Oregon-Washington Railroad & Navigation Company, to a connection with the Cascade line of this intervener at or near Crescent Lake, Oregon.

II

This intervener was a party in interest to said docket No. 19680 before the Interstate Commerce Commission, in which said order of December 3, 1929, was made, and this intervener was and is interested in the controversy before the Interstate Commerce Commission, and was and is interested in this suit brought by the Oregon-Washington Railroad & Navigation Company against the United States of America to set aside, annul, and suspend said order. Southern Pacific Company files this, its petition in intervention, under the authority of section 5 of the act of Congress of June 18, 1910 (36 Statutes at Large, p. 543), as affected by the act of Congress of October 22, 1913 (38 Statutes at Large, p. 220), and the act of Congress of March 3, 1911 (36 Statutes at Large, pp. 1150 and 1151).

III

During all the times herein mentioned your intervener has been and is now a corporation organized and existing under laws of the State of Kentucky, engaged, pursuant to its charter powers, in operating railroads in the State of Oregon and in other States and among the States of the United States. That of the lines of railroad operated by it, as aforesaid, there have been and are, among others:

(a) A main line from Portland, Oregon, via Eugene and Ashland to Oakland and San Francisco, California, known as the "Siskiyou Line."

(b) A second main line from Portland, Oregon, via Eugene and Klamath Falls to Oakland and San Francisco, California, known as the "Cascade Line."

(c) A main line from Oakland, California, via Sacramento, California, to Ogden, Utah.

(d) A main-line route from western Oregon via routes (a) and (b) connecting with route (c) at Roseville, California, and proceeding thence to Ogden, Utah.

(e) A main line from Klamath Falls, Oregon, to Fernley, Nevada, a station on route (c) known as the "Klamath Falls-Alturas" line.

91a IV

That of the railroad mileage operated by said Southern Pacific Company, as has been hereinbefore alleged, a substantial part thereof has been, during the times herein referred to, and is now, owned by

Central Pacific Railway Company, a corporation organized and existing under and by virtue of the laws of the State of Utah; that nearly all of the outstanding capital stock of said Central Pacific Railway Company is owned by your intervener, Southern Pacific Company, and all of the railroad mileage of said Central Pacific Railway Company is now and has been, during all of the times herein mentioned, under lease, dated March 3, 1923, and expiring December 31, 1984, to your intervener, Southern Pacific Company.

V

That during and prior to the year 1923, Central Pacific Railway Company owned a line of railroad extending from a connection with the Southern Pacific Company's railroad at Natron, Oregon, near Eugene, in a southeasterly direction to Oakridge, a distance of 34 miles, and another line extending from a connection with the Southern Pacific Company's railroad at Weed, California, in a northerly direction 127 miles to Kirk; that in the years 1923 to 1926 said Central Pacific Railway Company constructed its railroad connecting said two lines between Oakridge and Kirk, and in order to improve said line between Natron and its connection at Weed, California, said company constructed as a part of said main line a railroad from a point four miles south of Weed station in a general northeasterly direction to a point on its said Klamath Falls line near Grass Station, all in Siskiyou County, California, and said line was promptly placed in operation and during all of said times has been and is now operated by said Southern Pacific Company under said lease as aforesaid; that one of the principal inducing causes for the construction of said line of railroad from Natron through Klamath Falls to said point of connection south of Weed was to secure to said Southern Pacific Company for operation between Oregon and California points an alternate main line with lighter grades and less curvature and distance than obtained on the said first main line of the Southern Pacific Company above described, and also to enable said Southern Pacific Company more efficiently and economically to handle and transport through western Oregon traffic with California and with the East through the Ogden interchange with the Union Pacific Railroad Company, and to encompass and en-
92a joy the vast timber resources on the Cascade Range of mountains and on the easterly slope of same.

VI

That pursuant to authority granted to it by the Interstate Commerce Commission in May, 1926, Southern Pacific Company thereupon acquired control of the capital stock of the Nevada-California-Oregon Railway, a corporation owning and operating a narrow-gauge line of railroad from Lakeview, Oregon, to a connection with

the Central Pacific Railway Company's line of railroad at Wendel, California, and concurrently with the said acquisition of said control by the Southern Pacific Company the Central Pacific Railway Company obtained authority from the said Interstate Commerce Commission to construct and operate a line of railroad from a connection with its said Cascade line at Klamath Falls to a connection with said Nevada-California-Oregon Railway line at Alturas in northern California, a distance of 98 miles, and pursuant to said authority received by said Central Pacific Railway Company in May, 1926, it proceeded to and did construct said line of railroad from Klamath Falls to Alturas, and in the meantime and prior to the making of the order of the Interstate Commerce Commission herein complained of, Southern Pacific Company reconstructed said line of railroad of said Nevada-California-Oregon Railway and standardized the gauge of same between Lakeview, Oregon, and Wendel, California, and connected said Nevada-California-Oregon Railway with said Klamath Falls-Alturas line of railroad; that the cost to December 31, 1929, of the lines constructed and acquired in connection with said Klamath Falls-Alturas line, including the cost of bringing the acquired lines up to the standards of Southern Pacific Company, is approximately $16,000,000.00; that prior to said construction of said Klamath Falls-Alturas railroad line and the reconstruction of said Lakeview-Wendel railroad line, and since the year 1913, railroad traffic between points Ogden and east and western Oregon originating at or destined to points on Southern Pacific lines in western Oregon or lines tributary thereto was routed by said Southern Pacific Company through Roseville, California, and the principal consideration inducing Southern Pacific Company to cause the construction of said Klamath Falls-Alturas line and to effect the acquisition and reconstruction of the Lakeview-Wendel line was to obtain a more direct, efficient, and economical route for the handling of said transcontinental western Oregon business than the route afforded via Roseville, all of which said Interstate Commerce Commission recognized and acted upon
92a in granting authority to said Central Pacific Railway Company for the acquisition of said control of said Nevada-California-Oregon Railway and for the construction of said Klamath Falls-Alturas line and the reconstruction of said Nevada-California-Oregon line; that the route afforded by Southern Pacific Company for said transcontinental business between western Oregon and points Ogden and east via said Cascade line, Klamath Falls, Alturas, Wendel, and Ogden line is, between western Oregon points and eastern points, a direct and efficient route and one not unreasonably long as compared with the route via the proposed Cross-State line ordered to be built by the order under attack in this suit; that shipments moving via said existing route between western Oregon and eastern points move on a schedule as favorable and expeditious as could be afforded by the proposed Cross-State line.

VII

That on the Oregon lines of your intervener, Southern Pacific Company, originates a large part of the railroad traffic moving to and from western Oregon; that the capital investment of your intervener in its Oregon lines is approximately $150,000,000.00; that the operations of said Oregon lines for several years last past have resulted in a net return on the investment therein of less than one per cent per annum; that upon the trial of docket 19680 the year 1926 was agreed upon by all of the parties to said proceedings as representative of the operations of said Southern Pacific lines in Oregon; that during said year 1926 there were originated on said lines in Oregon 183,478 carloads of traffic, including shipments for both intrastate and interstate movement; of that number 151,876 carloads, or 82.7 per cent of the total, consisted of forest products, 11,555 carloads, or 6.3 per cent, consisted of agricultural products; 3,644 carloads, or 2 per cent, consisted of animals and animal products; 12,096 carloads, or 6.6 per cent, consisted of miscellaneous and manufactured products, and 4,346 carloads, or 2.4 per cent, were products of mines, consisting for the most part of gravel and rock for highway construction; of said total carloads originated as aforesaid 150,180, or 82 per cent of the total, moved locally to destination points on Southern Pacific Company lines or to points on connecting lines in territories that would not be reached by the proposed cross-State line involved herein; that upon said hearing before said Interstate Commerce Commission complainant classified as transcontinental all Oregon traffic, both east and west bound, originating with Southern Pacific lines in Oregon or received by said lines, destined to or
94a originating in territory east of the Oregon-Idaho or of the Washington-Idaho State boundary line or beyond the Nevada-Utah boundary line or to the south of the boundary line between New Mexico and Texas; that the total of said transcontinental traffic for said year 1926 via all routes and gateways amounted to 37,386 carloads, or 1,093,485 tons, of which 82.26 per cent consisted of forest products, 8.28 per cent consisted of agricultural products, 7.23 per cent consisted of miscellaneous and manufactured products, 2.18 per cent consisted of the products of mines, and .05 per cent consisted of livestock; of this traffic 33,434 cars (or 89.43 per cent) of the carloads and 1,008,174 tons (or 92.2 per cent of the tonnage) moved eastbound, but only 3,952 cars (or 10.57 per cent) of the carloads and 85,284 tons (or 7.8 per cent of the tonnage) moved westbound; that of said 37,386 carloads, 5,710 cars originated or were received in Klamath County and of said Klamath County traffic 5,364 cars originated in the county and moved east, while 346 cars originated in the east and were received in said county, and the balance of said total of 37,386 carloads or 31,676 cars originated and were received in western Oregon, divided 27,070 cars originating in western Ore-

gon and moving east and 3,606 cars received in western Oregon from the east; that since the completion of construction of said Klamath Falls-Alturas line and the placing of the same in operation on September 15, 1929, your intervener has routed and will continue to route the eastbound transcontinental traffic originating in western Oregon on its line of railroad over its Klamath Falls-Alturas line so as to retain the long haul on said traffic to its own rails wherever possible; that unless your intervener retains the long haul on said eastbound transcontinental traffic originating on its line for said Klamath Falls-Alturas line, the capital investment made by it in the construction and acquisition of said line will prove to be an unremunerative one; that the diversion of any considerable part of said traffic to the proposed cross-State line would necessarily render the investment of your intervener in said Klamath Falls-Alturas line unremunerative, and that your intervener will, so far as it legally may, retain the long haul on such traffic for its Klamath Falls-Alturas line in order to preserve the earning capacity of the investment made by it therein.

VIII

A through route for eastbound transcontinental traffic originating on the lines of your intervener in western Oregon and moving by way of its Klamath Falls-Alturas line to Fernley, Nevada, thence
95a on the San Francisco-Ogden main line of your intervener to Ogden and points east, is a through route which is practicable and not unreasonably long as compared with a through route for such traffic made up of a movement from points of origin on the lines of your intervener in western Oregon to the point of intersection with the Cascade line of your intervener of said proposed cross-State line and thence on said proposed cross-State line over the rails of the Oregon-Washington Railroad & Navigation Company and its connections to eastern transcontinental territory, and for that reason your intervener can not be compelled to establish with Oregon-Washington Railroad & Navigation Company a through route and joint rates for the transportation of passengers or freight from points of origin on its lines in western Oregon over your intervener's lines and said proposed cross-State line. The construction of said proposed cross-State line would result in an attempt being initiated to compel the establishment of such through route and such joint rates with resulting litigation and economic loss, and with consequent destruction of the capital investment of your intervener in said Klamath Falls-Alturas line were such through route and joint rates established by process of law or consequent destruction of the capital investment of Oregon-Washington Railroad & Navigation Company in said proposed cross-State line were the establishment of such through route and joint rates denied, and said proposed cross-State line thereby deprived of the eastbound transcontinental traffic originating on

the lines of your intervener in western Oregon, the movement of which over said proposed cross-State line alone affords any possible pretense for justifying its construction.

IX

That the traffic interchanged between your intervener and the Union Pacific Railroad Company at Ogden, Utah, has for many years last past and does now and will continue to preponderate heavily eastbound, and this is particularly true with respect to western Oregon traffic interchanged at said connection. That to the extent traffic eastbound and westbound can be balanced substantial savings in railroad operating cost can be effected as compared with traffic that is substantially unbalanced in direction, and as the traffic movement preponderates and increases in one direction as against the other substantially increased operating costs are necessarily incurred. That while westbound traffic received by the Southern Pacific Company at Ogedon and destined to western Oregon is small as compared with the movement of traffic originating in west-
96a ern Oregon and delivered to the Union Pacific Railroad Company at Ogden, the loss of said westbound traffic will increase the unbalanced traffic condition now obtaining at Ogden. That said westbound traffic is and will continue to be too small in volume to contribute to a substantial extent to the support of the proposed cross-State line, but the loss of same by its diversion to said proposed cross-State line will be to the disadvantage of your intervener in the operation of its said line from Ogden through Alturas and Klamath Falls to western Oregon, and such loss, if sustained, would contribute to rendering its investment in its Klamath Falls-Alturas line unremunerative.

X

That the said order of said Interstate Commerce Commission herein complained of was and is arbitrary, unreasonable, unlawful, and void, inasmuch as said proposed cross-State line ordered to be constructed by said Interstate Commerce Commission is not reasonably required in the interest of public convenience and necessity, and the finding of said Interstate Commerce Commission in its report in said cause "that an extension of the rail line of the Oregon-Washington Railroad & Navigation now terminating at or near Burns, Oregon, from or near a station thereon, designated as Crane, Oregon, to a connection with the Cascade line of the Southern Pacific at or near Crescent Lake, Oregon, by the Oregon-Washington Railroad & Navigation Company is reasonably required in the interest of public convenience and necessity" was and is wholly unsupported by the evidence in said cause, docket No. 19680, and said finding was and is contrary to the evidence taken in said cause and that the evidence and the record therein affirmatively show that said proposed

line is not reasonably required in the interest of public convenience and necessity.

XI

That said Interstate Commerce Commission was and is without power and jurisdiction to require by the order under attack in this suit the construction by Oregon-Washington Railroad & Navigation Company of said proposed cross-State line; that the power assumed by said Interstate Commerce Commission transcends the power of regulation granted to it by law, and in making and entering said order said Interstate Commerce Commission acted arbitrarily and contrary both to the express provisions and manifest intent of said interstate commerce act and beyond its powers under said act
97a and beyond the powers which could be granted to it by Congress under the Constitution of the United States.

Wherefore, your intervener prays that a decree be entered herein setting aside, annu'lling and suspending said order of the Interstate Commerce Commission hereinbefore set forth, and that the defendant, its officers and agents, be perpetually enjoined from enforcing or attempting to enforce said order.

SOUTHERN PACIFIC COMPANY,

[Title omitted.]

Petition of Public Service Commission of Oregon and of the Public Utilities Commission of the State of Idaho for leave to intervene

Filed September 10, 1930

To the Honorable Judges of the District Court of the United States for the District of Oregon:

Come now your petitioners, and respectfully represent that they have an interest in the matters in controversy in the above-entitled suit and desire to intervene therein and to become parties thereto and for grounds of the proposed intervention say:

1. That your petitioner, the Public Service Commission of Oregon, is and for approximately twenty-three years last past has been a

duly and regularly created and existing department of the State government of the State of Oregon under and by virtue of the laws of said State and vested by the laws of said State with certain powers and charged by the laws of said State with divers duties in respect of the regulation of railroads and of other common carriers and of public utilities and of their rates, fares, charges, service, facilities, rules, regulations, and practices in their operations within the State of Oregon, and that your petitioner, the Public Service Commission of Oregon, is composed of three commissioners each of whom is a citizen, resident, and inhabitant of the State of Oregon

101a and that the location, office, and place of business of your petitioner, the Public Service Commission of Oregon, are in the city of Salem, in the State of Oregon, and that your petitioner, the Public Service Commission of Oregon, is and at all said times has been authorized and directed by law to file complaints with the Interstate Commerce Commission in the interest of the public.

2. That your petitioner, the Public Utilities Commission of the State of Idaho, is a duly appointed, qualified, and acting body, established under and by virtue of the laws of the State of Idaho, with its office in the State capitol, Boise, Idaho, and vested with the power and charged with the duty of investigating all existing or proposed interstate rates, fares, tolls, charges, and classifications, for and in relation to the transportation of persons or property, where any act in relation thereto shall take place within the said State, and is charged with the duty of representing in an action before the Interstate Commerce Commission shippers, distributors, purchasers, and consumers of the commodities shipped by freight thereunder, when said rates, fares, tolls, charges, or classifications are excessive or discriminatory and in violation of the act of Congress entitled, "An act to regulate commerce," approved February 4, 1887, and the acts amendatory thereof and supplementary thereto.

3. That on May 24, 1927, your petitioner, the Public Service Commission of Oregon, filed with the Interstate Commerce Commission the complaint which is referred to in Article II of the petition in the above-entitled suit and a copy of which, marked "Exhibit A," is attached to such petition on pages 53 to 56 thereof, both inclusive, and that said complaint was numbered 19680 on the docket of the Interstate Commerce Commission.

4. That thereafter your petitioner, the Public Utilities Commission of the State of Idaho, sought and obtained leave from the Interstate Commerce Commission to intervene in support of the complaint docketed as number 19680 as aforesaid, and thereupon participated actively in all the subsequent proceedings before the Interstate Commerce Commission in said docket numbered 19680.

102a 5. That thereafter your petitioner, the Public Service Commission of Oregon, brought on for hearing before the Interstate Commerce Commission its said complaint and thereupon such proceedings were had before the Interstate Commerce Commission as resulted in the making and entry by the Interstate Commerce

Commission on December 3, 1929, of a report and order in said docket No. 19680, a copy of which report and order, marked "Exhibit B," is attached to the petition in the above-entitled suit, and that by such report and order the Interstate Commerce Commission granted to your petitioner, the Public Service Commission of Oregon, substantially the relief sought by your petitioner, the Public Service Commission of Oregon, in and by its said complaint.

6. That the object of the litigation embraced in the above-entitled suit is a decree of this court perpetually enjoining the defendant, its officers and agents, from enforcing or attempting to enforce said order of the Interstate Commerce Commision in its said docket No. 19680 and setting aside, annulling, and suspending the same and perpetually enjoining the defendant and its officers and agents from instituting and prosecuting any action or proceeding to recover any penalty or penalties from the petitioner in the above-entitled suit by reason of its refusal or neglect to comply with said order of the Interstate Commerce Commission, and declaring unconstitutional and void that certain provision in paragraph 21 of section 1 of the interstate commerce act concerning the extension of the line or lines of carriers by railroad subject to said act as construed and applied by the Interstate Commerce Commission in its report and order in said docket No. 19680, and that the granting by this court of the relief sought by the petitioner in the above-entitled suit would wholly destroy and nullify the relief granted and accorded to your petitioner, the Public Service Commission of Oregon, by the Interstate Commerce Commission in and by its said order in said docket No. 19680.

7. That the interest of your petitioners in the litigation that is embraced in the above-entitled suit is to aid and to
103a support the defendant in defending and maintaining the lawfulness of said order of the Interstate Commerce Commission in its said docket No. 19680 and the constitutionality of paragraph 21 of section 1 of the interstate commerce act concerning the extension of the line or lines of carriers by railroad subject to said act as construed and applied by said Interstate Commerce Commission in its said order.

8. That section 212 of the Judicial Code provides "that the Interstate Commerce Commission and any party or parties in interest to the proceeding before the commission in which an order or requirement is made may appear as parties thereto of their own motion and as of right and be represented by their counsel in any suit wherein is involved the validity of such order or requirement or any part thereof, and the interest of such party; and the court wherein is pending such suit may make all such rules and order as to such appearances and representations, the number of counsel, and all matters of procedure, and otherwise, as to subserve the ends of justice and speed the determination of such suits: Provided further, That communities, associations, corporations, firms, and indi-

viduals who are interested in the controversy or question before the Interstate Commerce Commission, or in any suit which may be brought by any one under the provisions of this chapter, or the acts of which it is amendatory or which are amendatory of it, relating to action of the Interstate Commerce Commission, may intervene in said suit or proceedings at any time after the institution thereof; and the Attorney General shall not dispose of or discontinue said suit or proceeding over the objection of such party or intervenor aforesaid, but said intervenor or intervenors may prosecute, defend, or continue said suit or proceeding unaffected by the action or non-action of the Attorney General therein."

9. That section 213 of the Judicial Code provides that "Complainants before the Interstate Commerce Commission interested in a case shall have the right to appear and be made parties to the case and be represented before the courts by counsel, under such regu-
104a lations as are now permitted in similar circumstances under the rules and practice of equity courts of the United States."

10. That rule 37 of the rules of practice in equity provides that "anyone claiming an interest in the litigation may at any time be permitted to assert his right by intervention, but the intervention shall be in subordination to and in recognition of the propriety of the main proceeding."

11. That the intervention of your petitioners as parties defendant in this suit is reasonably necessary to protect their interests and the interest of the States of Oregon and of Idaho, and of the citizens thereof, in whose behalf this petition for leave to intervene is filed, and will not enlarge the scope of the issues tendered by the petition therein or vary the same.

Wherefore your petitioners pray for an order granting them leave to intervene in this suit and to serve and to file their answer (herewith exhibited) and making them parties defendant to this suit with the right thereafter to participate therein as fully and with the same effect as if they had been named as defendants in the petition herein, and according them such further relief as may be meet and proper in the premises, and your petitioners as in duty bound will ever pray.

I. H. VAN WINKLE,
Attorney General of Oregon,
WILLIAM P. ELLIS,
WILLIAM C. MCCULLOCH,

Order granting leave to intervene

Filed Sept. 10, 1930

This cause coming on to be heard upon the verified petition of Public Service Commission of Oregon and of Public Utilities Commission of the State of Idaho for leave to intervene herein as parties defendant, and the court having read the same and finding the allegations of the petition to be true and having examined the answer tendered for service and filing by said petitioners and being fully advised in the premises, and good cause appearing therefor, it is

Ordered, adjudged, and decreed that the prayer of said petitioners for leave to intervene be and the same is hereby granted and that said petitioners be and they are given leave hereby to intervene herein and to serve and to file their answer and that they be and they are hereby made parties defendant to this suit with the right hereafter to participate therein as fully and with the same effect as if they had been named as defendants in the petition or bill of complaint in this suit.

Done this 10th day of September, 1930.

Order granting Great Northern Railway Company, Oregon Trunk Railway, and Oregon Electric Railway Company leave to intervene

Filed Sept. 26, 1930

This cause coming on to be heard upon the verified petition of Great Northern Railway Company, a corporation, Oregon Trunk Railway, a corporation, and Oregon Electric Railway Company, a corporation, for leave to intervene herein, and the court having read the same and finding the allegations of the petition with respect to the right to intervene to be true, and being fully advised in the premises, and good cause appearing therefor,

IT IS ordered, adjudged, and decreed that the prayer of said petitioners, Great Northern Railway Company, a corporation, Oregon Trunk Railway, a corporation, and Oregon Electric Railway Company, a corporation, for leave to intervene, be, and the same is hereby, granted, and that said petitioners be, and they are hereby, given leave to intervene herein and to serve and file their petition in intervention, and that said interveners be made parties plaintiff to this suit, with the right hereafter to participate therein as fully and to the same effect as if said interveners had been named as
112a plaintiffs in the petition or bill of complaint in this suit.

Dated, this 26 day of September, 1930.

Petition in intervention of Great Northern Railway Company, a corporation; Oregon Trunk Railway, a corporation; and Oregon Electric Railway Company, a corporation

Filed September 26, 1930

To the Honorable Judges of the District Court of the United States for the District of Oregon:

Your petitioners, Great Northern Railway Company, a corporation; Oregon Trunk Railway, a corporation; and Oregon Electric Railway Company, a corporation, file this their petition in intervention in the above-entitled court and cause, to adjoin, set aside, and annul an order of the Interstate Commerce Commission, made and entered in docket No. 19680, on December 3, 1929, and in support thereof your petitioners respectfully allege and show:

I

Heretofore and on the 24th day of May, 1927, the Public Service Commission of Oregon filed its complaint with the Interstate Commerce Commission, naming as defendants, among others, your petitioners, Great Northern Railway Company, a corporation; Oregon Trunk Railway, a corporation; and Oregon Electric Railway Company, a corporation. In and by said complaint said Public
115a Service Commission of Oregon prayed for an order requiring one or more of the defendants named in said complaint to construct a line of railroad between Crane or Harriman, Oregon, on the east, and Crescent Lake or some adjacent point on the line operated by the Southern Pacific Company, on the west; that said cause was heard before said Interstate Commerce Commission, and on the 3rd day of December, 1929, said commission made and entered its report and order in said cause, known as docket No. 19680, by the terms of which order Oregon-Washington Railroad & Navigation Company, the petitioner herein, was required to construct 185 miles of railroad through central Oregon from a point on the Ontario-Burns line of railroad of said Oregon-Washington Railroad & Navigation Company to a connection with the Cascade line of Southern Pacific Company at or near Crescent Lake, Oregon.

II

These interveners were parties in interest to said docket No. 19680 before the Interstate Commerce Commission in which said order of December 3, 1929, was made, and these interveners were and are

interested in the controversy before the Interstate Commerce Commission, and were and are interested in this suit brought by the Oregon-Washington Railroad & Navigation Company against the United States of America to set aside, annul, and suspend said order. These interveners file this their petition in intervention under the authority of section 5 of the act of Congress of June 18, 1910 (36 Statutes at Large, p. 543), as affected by the act of Congress of October 22, 1913 (38 Statutes at Large, p. 220), and the act of Congress of March 3, 1911 (36 Statutes at Large, pp. 1150 and 1151).

III

During all the times herein mentioned your intervener Great Northern Railway Company has been and now is a corporation organized under the laws of the State of Minnesota, your
116a intervener Oregon Trunk Railway has been and is now a corporation organized under the laws of the State of Washington, and your intervener Oregon Electric Railway Company has been and is now a corporation organized and existing under the laws of the State of Oregon. Interveners have been engaged and are now engaged, pursuant to charter powers, in operating railroads in interstate commerce.

IV

All of the capital stock of intervener Oregon Trunk Railway, and substantially all of the capital stock of Oregon Electric Railway Company, is owned and held by Spokane, Portland and Seattle Railway Company, a Washington corporation; and all of the capital stock of said Spokane, Portland and Seattle Railway Company is owned jointly and equally by Great Northern Railway Company and Northern Pacific Railway Company.

V

Pursuant to authority granted by the Interstate Commerce Commission in its finance docket No. 4810 and related cases, intervener Great Northern Railway Company has constructed a line of railroad from a point near Bend, Oregon, to a connection with the Cascade line of the Southern Pacific Company at Chemult, Oregon, and has acquired the right to use said Cascade line of the Southern Pacific Company between Chemult and Klamath Falls, Oregon. By contracts duly approved by the Interstate Commerce Commission said intervener has also acquired the right to operate its trains over the lines of Oregon Trunk Railway and Spokane, Portland and Seattle Railway Company between Spokane, Washington, and Bend, Oregon, and between Portland, Oregon, and Bend, Oregon, and there has thus been established a through route for the transportation of transcontinental traffic between Klamath Falls and all points served by

said intervener and its connections. Said new through route is adequate in all respects to serve said Klamath territory.

117a In finance docket No. 7439 of the Interstate Commerce Commission intervener Great Northern Railway Company has been authorized to construct and is now engaged in constructing a line of railroad from Klamath Falls southerly to a connection with a line of railroad duly authorized and now under construction by Western Pacific Railway Company. Said construction when completed will result in a new through route formed by the lines of said intervener and said Western Pacific Railway Company between California on the southwest and the entire northwestern country.

VI

The main line of intervener Oregon Electric Railway Company between Portland, Oregon, and Eugene, Oregon, traverses the Willamette Valley, and said line, together with the line of its parent company, Spokane, Portland and Seattle Railway Company, between Portland, Oregon, and Spokane, Washington, and with the lines of the latter's parent companies, Northern Pacific Railway Company and Great Northern Railway Company, forms a through route for transportation of the products of western Oregon, which are in large part forest products, to the natural markets for such products in transcontinental territory. For a number of years last past intervener Oregon Electric Railway Company has earned no return upon the investment in its line of railroad.

For the purpose of enabling it to participate to a greater extent in the transportation of said forest products from western Oregon to eastern transcontinental territory, intervener Oregon Electric Railway Company has secured authority to construct, and is now constructing, an extension of its line of railway (in connection with joint user of Southern Pacific line between Albany and Lebanon, Oregon) from Albany easterly into timbered areas in Linn County, Oregon. Authority for such construction was granted in finance docket No. 6765 of the Interstate Commerce Commission. Intervener Oregon Electric Railway Company has also applied for certificates authorizing the construction of an extension of

118a its line southwesterly from Eugene, and for permission to connect with and to acquire the properties of Valley and Siletz Railway Company extending westerly from Independence, Oregon, to Valsetz, Oregon.

VII

The main line of intervener Oregon Trunk Railway extending from Wishram, Washington, to Bend, Oregon, serves a substantial portion of central Oregon, including Deschutes, Crook, and Jefferson Counties, and said intervener's line, together with the line of its

parent company, Spokane, Portland and Seattle Railway Company, from Wishram to Spokane, Washington, and the lines of the parent companies of said Spokane, Portland and Seattle Railway Company, Northern Pacific Railway Company, and Great Northern Railway Company, forms a through direct route for the transportation of the products of said central Oregon region to eastern transcontinental destinations.

For a number of years last past intervener Oregon Trunk Railway has earned no return upon the investment in its line of railroad.

VIII

The order of the Interstate Commerce Commission requiring the construction of said cross-State line railroad is based in part on evidence and findings that certain of the traffic originating in the Klamath region in Oregon, now moving via the line of intervener Great Northern Railway Company, would be diverted to the said cross-State line, and that certain of the traffic originating in western Oregon would be diverted from the present routes between western Oregon and eastern transcontinental destinations, to the proposed cross-State line, and that a substantial portion of the territory served by intervener Oregon Trunk Railway would be tributary to the proposed cross-State line, and that products thereof,
119a particularly forest products, which now move or which in the future may move via intervener Oregon Trunk Railway's line and its connections, will be diverted to the proposed cross-State line.

Interveners represent and allege that the traffic originating in the territories served by their respective lines is not now adequate to support said lines or to enable them to earn a fair return upon the capital investment involved, and that the diversion to said proposed cross-State line of any of said traffic will be to the disadvantage of interveners in the operation of their respective lines and will contribute to make said investment unremunerative.

IX

Interveners further represent and allege that their said lines, together with said connections forming the through routes described, are in all respects adequate to serve their respective territories, and that additional railroad facilities are not reasonably required in the public interest.

X

Interveners further represent and allege that the Interstate Commerce Commission was and is without power and jurisdiction to require by the order under attack in this suit the construction by

Oregon-Washington Railroad & Navigation Company of said proposed cross-State line; that the power assumed by the Interstate Commerce Commission transcends the power of regulation granted to it by law, and in making and entering said order the Interstate Commerce Commission acted arbitrarily and contrary both to the express provisions and manifest intent of the interstate commerce act, and beyond its powers under said act and beyond the powers which could be granted to it by Congress under the Constitution of the United States.

120a Wherefore, interveners pray that a decree be entered herein setting aside, annulling, and suspending said order of the Interstate Commerce Commission hereinbefore set forth, and that the defendant, its officers and agents, be perpetually enjoined from enforcing or attempting to enforce said order.

GREAT NORTHERN RAILWAY COMPANY,
A Corporation,
OREGON TRUNK RAILWAY,
A Corporation,
OREGON ELECTRIC RAILWAY COMPANY,
A Corporation,

Answer of United States of America

Filed July 30, 1930

United States, the defendant, for answer to the petition filed herein against it answers and says:

I

United States admits, for the purposes of this suit, the allegations of the opening paragraph and the following numbered paragraphs of the petition: 1, 2, 3, 4, 5, 9, 15, 16, 17, 18, 19, 20, 21, 24, 26, 27, 28, and 34.

II

For answer to the matters, things, and conclusions alleged in the paragraphs of the petition numbered 6, 7, 8, 10, 11, 12, 13, 14, 22, 23,

25, 29, 30, 31, 32, 33, and 35, United States alleges that, as averred and admitted in said paragraph numbered 35 of the petition, all the facts alleged in the paragraphs just enumerated " appeared upon the hearing of said matter so brought and pending before " said commission and were duly considered and weighed by the commis-
123a sion in connection with all the other facts and circumstances submitted to it at said hearing in reaching the conclusions of fact set forth and appearing in its report (159 I. C. C. 630) attached to the petition and made a part thereof as Exhibit B. United States further alleges that the facts, conclusions, and matters alleged in said paragraphs are evidential, argumentative, and are incompetent, irrelevant, and immaterial to the issues laid by the petition herein, and are facts and matters exclusively for consideration by the commission in its administrative capacity and may not be considered and weighed by this court in determining the legality of said order of the commission, and that said allegations require no answer, and as to them the United States neither admits nor denies. United States denies that the facts alleged in said paragraphs constitute all the pertinent evidence submitted to and considered by the commission and alleges that, in addition to the facts and conclusions averred in said paragraphs, a large volume of other acts were submitted to and were weighed and considered by the commission in rendering its said report and order.

III

For answer to the matters, things, and conclusions alleged in paragraphs numbered 36 to 58, inclusive, of the petition, United States denies that said order of the commission is unreasonable, unlawful, arbitrary, or void for the reasons, or any of them, alleged in those paragraphs, or for any other reasons; and United States denies all and singular the allegations of said paragraphs except as and to the extent only as here admitted.

(a) United States admits that paragraph 21 of section 1 of the interstate commerce act contains the language quoted in paragraph numbered 39 of petition, but respectfully refers the court to the statute itself (41 Stat. L. 494; U. S. C., tit. 49, § 1 (21)) for the complete language of that section.

124a (b) United States admits that the questions, answers, and discussions quoted in said paragraph 42 of the petition occurred and appear in the record before said commission, but denies the inferences and conclusions drawn and alleged in the petition concerning them in said paragraphs.

(c) United States admits that paragraph 4 of section 15 of the Interstate commerce act contains the language quoted in said paragraph numbered 45 of the petition, but denies that said order of the commission violates the provisions of said section.

Further answering the allegations of said paragraphs, United States expressly denies:

(a) The allegation contained in said paragraph 37 that said order of the commission is unsupported by evidence.

(b) The allegation in said paragraph 38 that said order is in excess of the jurisdiction of the commission, or otherwise unlawful.

(c) The allegations in paragraph numbered 53, in substance that the commission "exceeded its jurisdiction and erroneously construed and applied law."

(d) The allegations in paragraph numbered 55, in substance that the result of the interpretation placed upon the law by the commission will be an unlawful appropriatior of petitioner's property.

(e) The allegation in paragraph numbered 56, that paragraph 21 of section 1 of the interstate commerce act as construed and applied by the commission is unconstitutional.

(f) The allegation in paragraph numbered 57 that said order of the commission is supported by no substantial evidence and is unreasonable, arbitrary, unlawful, and void.

(g) The allegation in paragraph numbered 58 that irreparable or other legal injury or loss will result to petitioner from said order of the commission.

125a

IV

With the exception of the allegations expressly admitted in this answer, United States denies each and every allegation contained in the petition, in so far as they are in conflict with the allegations herein, or with the findings and conclusions of fact and law included in said report and order of said commission.

V

Further and affirmatively answering the allegations of the petition, United States alleges that the findings and conclusions set forth and contained in said report of the commission, upon which its said order is based, are fully supported by substantial evidence duly submitted by the parties to the commission; that in making and rendering its report and order the commission accorded all parties, including the petitioner, a full, complete, and adequate hearing; that said order is not in excess of the commission's jurisdiction and is not arbitrary, unlawful, or void, and is not based upon an erroneous construction of law by the commission, and that said paragraph 21 of section 1 of the interstate commerce act, as construed and applied by the commission in making and entering said report and order, does not violate the Constitution of the United States or any of the provisions thereof.

Wherefore having fully answered, United States prays that the relief sought be denied and the petition dismissed with costs to the

petitioner, and that United States have the benefit of such other and further orders, decrees, and relief as may be deemed proper.

ELMER B. COLLINS,
Special Assistant to the Attorney General.

JOHN LORD O'BRIAN,
The Assistant to the Attorney General.

GEORGE NEUNER,
United States Attorney.

126a [Duly sworn to by Elmer B. Collins; jurat omitted in printing.]

UNITED STATES OF AMERICA,
District of Oregon, ss:

Due and legal service of the within answer is hereby admitted and accepted within the State and District of Oregon, on the 30th day of July, 1930, by receiving a copy thereof duly certified to as a true and correct copy of the original by George Neuner, United States attorney for the District of Oregon.

ROY F. SHIELDS,
Of Attorneys for Petitioner.

Answer of Interstate Commerce Commission

Filed Aug. 25, 1930

The Interstate Commerce Commission, hereinafter called the commission, intervening defendant in the above-entitled suit, now and at all times hereafter saving and reserving to itself all and all manner of benefit and advantage of exception to the many errors and insufficiencies in the petition contained, for answer thereunto, or unto so much or such parts thereof as it is advised that it is material for it to answer, answers and says:

I

Answering the opening paragraph and paragraphs 1, 2, and 3 of the petition, the commission admits for the purposes of this suit that the allegations contained in said paragraphs are true.

129a II

Answering paragraph 4 of the petition, the commission admits and alleges that it made and entered the report and order dated

December 3, 1929, in a proceeding entitled Public Service Commission of Oregon v. Central Pacific Railway Company et al., docket No. 19680, reported at 159 I. C. C. 630, and the commission refers the court to the text of the said report and order for full, complete, and accurate information concerning the contents thereof, and for a full description of the proceedings before the commission upon which said report and order were and are based; that said order required that the construction of the extension of petitioner's line from, or near, a station thereon designated as Crane, Oreg., to a connection with the Cascade line of the Southern Pacific Company at, or near Crescent Lake, Oreg., should be commenced on or before July 1, 1930; but by order dated June 19, 1930, said order of December 3, 1929, was modified by postponing said date on or before which construction of said extension must be commenced to January 1, 1931.

III

Answering paragraph 5 of the petition, the commission admits the allegations therein contained and admits the jurisdiction of this court over the subject matter of this suit.

IV

Answering paragraphs 6 to 37, both inclusive, and paragraphs 48 to 52, both inclusive, of the petition, the commission al-
130a leges that in said proceeding it accorded to the petitioner herein, Oregon-Washington Railroad & Navigation Company, the full hearing provided for by section 1 (21) of the interstate commerce act and that at said hearing a large volume of testimony and other evidence bearing upon the matters covered by said report and order was submitted to the commission for consideration, including testimony and other evidence submitted on behalf of petitioner herein by its counsel, and that at said hearing and subsequently, both orally and in briefs filed in said proceeding, questions relating to said matters were fully argued and submitted to the commission for determination, whereupon the commission determined said matters and entered and served upon the parties to said proceeding the aforesaid report and order, which said report and order included the commission's findings of fact, decisions, conclusions, and requirements in the premises, and that upon the evidence aforesaid, as shown in and by said report, the commission made the findings and stated the conclusions upon which said order is based; that the findings and conclusions in said report were and are, and that each of them was and is, fully supported and justified by the evidence submitted to the commission in said proceeding as aforesaid; that in making said report the commission considered and weighed carefully, in the light of its own knowledge and experience, each fact, circumstance, and condition called to its attention on behalf of the parties in said proceeding by their coun-

sel, including matters covered by the allegations of the petition herein; that said order was not made or entered either arbitrarily or unjustly, or contrary to the relevant evidence, or without evidence, or without evidence to support it, and the commission denies each of and all the allegations to the contrary contained in the petition.

131a

V

Answering paragraphs 38 to 47, both inclusive, and paragraphs 53 to 57, both inclusive, of the petition, the commission denies that said order is either unlawful or void for the reasons, or for any of the reasons, set forth in said paragraphs, denies that in making said order it either exceeded the authority which had been duly conferred upon it or exercised that authority in an unreasonable manner, and denies each of and all the allegations to the contrary contained in the petition. The commission further denies that said order is based upon a misinterpretation of any of the provisions of the interstate commerce act, denies that in making said order it acted beyond the power duly conferred upon it by law, and denies that the enforcement of said order will deprive petitioner of its property without due process of law.

VI

Answering paragraph 58 of the petition, the commission denies that petitioner will suffer either irreparable injury or irreparable damage unless enforcement of said order of December 3, 1929, is enjoined and suspended.

Except as expressly herein admitted, the commission denies the truth of each of and all the allegations contained in the petition in so far as they conflict either with the allegations herein, or with either the statements or conclusions of fact included in said report of December 3, 1929, which said report and the order of the same date are hereby referred to and made a part hereof.

132a All of which matters and things the commission is ready to aver, maintain, and prove as this honorable court shall direct, and hereby prays that said petition be dismissed.

INTERSTATE COMMERCE COMMISSION,
By J. STANLEY PAYNE,
Assistant Chief Counsel.

DANIEL W. KNOWLTON,
Chief Counsel, of Counsel.

[*Duly sworn to by Clyde B. Aitchison; jurat omitted in printing.*]

134a In United States District Court

[Title omitted.]

Answer of Public Service Commission of Oregon and of Public Utilities Commission of the State of Idaho, intervening defendants, to the petition of the above-named petitioner

Filed Sept. 10, 1930

These intervening defendants (averring that the facts, conclusions, matters, and things alleged in paragraphs 6, 7, 8, 10, 11, 12, 13, 14, 22, 23, 25, 29, 30, 31, 32, 33, and 35 are argumentative, evidential, incompetent, irrelevant and immaterial with relation to the issues tendered by the petition herein and are facts, matters and things exclusively for consideration by the Interstate Commerce Commission in its administrative capacity and may not be considered and weighed by this court in determining the legality of the order of the Interstate Commerce Commission that is involved in this suit but not waiving the benefit of said averment or their rights thereunder by their specific admission, denial, denial for lack of knowledge, or explanation, as hereinafter alleged, of said facts, conclusions, matters and things contained in said paragraphs) for their answer to the petition herein say:

1. Answering Article I:

They aver that the petitioner has several branch lines of railroad in Oregon, Washington, and Idaho and that said branch lines are neither so numerous nor so extensive as to penetrate into or to serve any part of the territory tributary to the "proposed cross-State line" mentioned in Article XIV of the petition, and that the petitioner is the successor of the Oregon Railroad and Navigation Company, which for many years prior to November, 1910, owned and operated main lines of railroad from Portland to
135a Huntington, Oregon, and to Spokane, Washington, and divers branch lines in Oregon, Washington, and Idaho, and except as in this sentence explained they admit the facts alleged in paragraph 1.

They aver that the petitioner's line of railroad from Ontario, Oregon, to Crane, Oregon, is the completed part of the main line of the railroad projected by Oregon Eastern Railway Company about the year 1905 to extend westerly from Ontario, Oregon, to Natron, near Eugene, Oregon; that the original articles of incorporation of the petitioner herein were dated November 23, 1910, and were executed and filed in pursuance of law on or about that date; that section first of Article III thereof declared the enterprise, business, pursuit, or occupation of the petitioner to be "to purchase, acquire, own, hold, construct, complete, equip, maintain, and operate the railroads, railroad property, and telegraph lines hereinafter men-

tioned with their appurtenances and to carry freight and passengers thereon and to receive tolls for such carriage and in all things and in every lawful manner to exercise the powers, privileges, franchises, and functions of a railroad company and of a common carrier in respect to each and all of such lines, to wit:

"18. That part of the railroad and telegraph lines projected and proposed to be constructed by Oregon Eastern Railway Company consisting of (a) a line from Vale across the State of Oregon to a point at or near Odell in said State; (b) a line from a point in Christmas Valley, in the State of Oregon, on said line from Vale to Odell, thence through Silver Lake Valley and through Chewaucan Valley and Goose Lake Valley to a point on the boundary line between California and Oregon in township forty-eight (48) north, range fourteen (14) east of Mt. Diablo meridian; (c) a line from Bend, in said State of Oregon, to Odell in said State"; that Odell, Oregon, is not and never was anything but a name used to designate the westerly terminus of the Oregon Eastern Railway Company's survey of its projected line from Vale westerly across the State of Oregon, and that Crescent Lake, Oregon, which is the proposed western terminus of said cross-State line, is located approximately on the site formerly known as Odell, Oregon; that the petitioner herein on November 8, 1923, by a resolution duly adopted by its board of directors provided for the extension of its line from Crane to Burns and authorized the construction, maintenance, and operation of such extension and therein adopted the said extension as a branch of its existing line of railway; that the petitioner herein on
136a July 11, 1928, and more than one year after the complaint in said docket 19680 was filed with the Interstate Commerce Commission executed and filed in the manner prescribed by law, supplementary articles of incorporation, and thereby amended paragraph 18 aforesaid of section first of Article III of the original articles of incorporation, to read as follows:

"18. The line of railroad and telegraph extending from Vale in Malheur County to Burns in Harney County, both in the State of Oregon"; that Burns, Oregon, is not and never was the designated and intended terminus of said projected main line of railroad; and that the cross-State line shown on the map attached to the petition herein and designated "Exhibit C," the construction of which was ordered and required by the Interstate Commerce Commission in its docket No. 19680, as alleged in paragraph 4 of the petition, was and is the uncompleted portion of said projected main line of railroad. Except as in the foregoing sentence explained they admit the facts alleged in paragraph 2.

2. They admit the facts alleged in Article II.

3. They admit the facts alleged in Article III.

4. Answering Article IV:

They admit the facts alleged in paragraphs 6 and 7.

With respect to paragraph 8:

They admit that limited areas in Malheur County and in Harney County and very limited areas in Lake County are now accessible to existing lines of railroad and are served by such lines and that timbered areas are found on the eastern slope of the Cascade Range and in certain portions of Lake County, and that such timbered areas contain in the aggregate many billion feet of timber. They aver that "the southern half of eastern Oregon" as described in Article IV comprises many millions of acres in extent and contains within its limits the route of said cross-State line and the territory that would be served by it and that would be tributary to said line; that said southern half of eastern Oregon is not in its entirety or largely or at all a desert country or a "great high desert" or a "great sandy desert"; that within accessible depths below the surface of said southern half of eastern Oregon there are subterranean sources of good, potable water in ample and substantial quantity and that through the drilling of wells and through pumping such subterranean water could be made available for domestic con-
137a sumption, for livestock, and for surface irrigation of the land and that such subterranean waters would be sufficient for such purposes and that it would be practicable so to obtain such water; that said southern half of eastern Oregon is not a "desert area" but that many millions of acres of land therein are well adapted and suitable for settlement, reclamation, and cultivation; that said southern half of eastern Oregon is a rich and productive district but that it is in part semi-arid at certain times of the year; that the annual rainfall therein averages from ten to twelve inches; that in some parts of said southern half of eastern Oregon it is necessary to irrigate the rich, volcanic ash soil to secure good crops; that alfalfa, grain, and all root crops are grown successfully in said southern half of eastern Oregon; that dairying and poultry raising are important industries in said southern half of eastern Oregon and that where dry-farming methods are carried on therein intelligently, fair crops of grain are produced; that the elevation of said southern half of eastern Oregon varies from about 2,500 to 4,750 feet; that said southern half of eastern Oregon is a district of abundant sunshine and where irrigation is not practiced vast stretches of luxuriant sagebrush are found; that stock raising is one of the principal industries of said southern half of eastern Oregon; that there is a large amount of Government land and of State school land in said southern half of eastern Oregon but that on account of the lack of transportation therein by railroads settlers in many districts thereof are few and far between; that a branch experiment station at Burns, Oregon, serves the settlers in said southern half of eastern Oregon in recommending approved varieties of seed grain, methods of dry land tillage, and other farm practices; that in said southern half of eastern Oregon many hardy crops can be grown successfully without serious damage from frost and that the settlement of land

"along the entire route of said proposed railroad and for a distance of fifty miles on either side of it" is and would be feasible and practicable if the said cross-State line were constructed and that the settlement of the land and the growth of population within said area are prevented and made impossible by the lack of rail transportation facilities therein. Whether the southern half of eastern Oregon is known commonly as the "Great High Desert" or is described officially as the "Great Sandy Desert" they state that they are without knowledge and, except as thus admitted, explained, or denied for lack of knowledge, they deny every fact and conclusion alleged in paragraph 8 and particularly that the southern half of eastern Oregon is almost in its entirety or largely
138a or at all a high desert country; that the southern half of eastern Oregon is a great high desert or a great sandy desert or that it is almost entirely or largely or at all without water or that it has no known or practicable available source from which good potable water in substantial quantity can be obtained; that the southern half of eastern Oregon is not adapted or suitable for settlement, reclamation, or cultivation; that the annual rainfall throughout the southern half of eastern Oregon is less than 10 inches; that with respect to a substantial or any part of the southern half of eastern Oregon killing frosts obtain in every month of the year; that along the entire route of said proposed railroad and for a distance of 50 miles on either side of it there is no town or settlement except the town of Burns; and that said town of Burns either alone or with its environs has a population of not more than 200 persons.

5. Answering Article V:

With respect to paragraph 9—

They admit the fact alleged in lines numbered 22 to 31, both inclusive, and in lines numbered 1 to 4, both inclusive, of that part of paragraph 9 of the petition appearing on pages 5 and 6 thereof.

They admit that the Southern Pacific Company now has, controls, and operates in the State of Oregon several branch and feeder lines of railway connecting with its main line in said State, but they aver that said branch and feeder lines are neither so numerous nor so extensive as to penetrate into or serve any part of the territory adjacent (that is, lying with fifty miles to the north and fifty miles to the south thereof and at right angles thereto) to the proposed cross-State line aforesaid. Except as thus admitted or explained they state that they are without knowledge of the facts and conclusions alleged in paragraph 9.

With respect to paragraph 10—

They admit the facts alleged in line 16 to 24 (to the semicolon), both inclusive, of page 6 but in this connection they explain that Portland and its immediate vicinity and Columbia and Clatsop Counties do not lie in any part of the territory tributary to said cross-State line and that no inconsiderable part of the railroad traffic

in western Oregon originates or finds its destination on railroad lines other than those of the Southern Pacific Company. They admit the facts alleged in lines 28 to 32, both inclusive, of page 6 and in lines 1 to 5 (to the semicolon), both inclusive, of page 7.

They admit the facts alleged in lines 8 (from the period) to
139a 29 (to the comma), both inclusive, of page 7, but explain in connection therewith that of the total of said transcontinental traffic for the year 1926 that part only moving through Ogden, Utah, and amounting to 27,218 cars would derive particular benefit from the construction of said cross-State line, if it were routed thereover. They state that they are without knowledge of the facts and conclusions alleged in lines 5 (from the semicolon) to 8 (to the period), both inclusive, of page 7. They state that they are without knowledge of the facts and conclusions alleged in lines 29 (from the comma) to 32, both inclusive, of page 7, and in line 1 of page 8. They state that they are without knowledge of the length of the lines operated in Oregon of the Southern Pacific Company or of the capital invested therein or of the net return on the investment therein that has resulted from the operation of said lines for past years. Except as thus admitted, explained, or denied for lack of knowledge, they deny the facts and conclusions alleged in paragraph 10.

With respect to paragraph 11—

They admit the facts alleged therein but explain in connection therewith that none of the lines of railroad mentioned therein serve any part of the territory that would be adjacent to said cross-State line and they aver that for traffic between (a) many points in western Oregon and (b) Ogden, Utah, and points east of Ogden said cross-State line would constitute an alternate main line with lighter grades and less curvature and distance than would obtain via the Southern Pacific Company's Cascade Line by way of Roseville or Alturas, California, or via any other route.

With respect to paragraph 12—

They admit the facts alleged in lines 2 to 32, both inclusive, thereof on page 9. They aver that a route would be afforded by said cross-State line for transcontinental business between western Oregon and Ogden, Utah, and points east thereof via said "Natron cut-off," Crescent Lake, Oregon, Crane, Oregon, Ontario, Oregon, and Pocatello, Idaho, and that said route would be much more direct, efficient, and economical for the handling of said transcontinental western Oregon business than the route afforded by the Southern Pacific Company via Klamath Falls, Alturas, and Wendel. Except as thus explained they deny the facts and conclusions alleged in lines 1 to 7, both inclusive, of paragraph 12 on page 10.

104a With respect to paragraph 13—

They state that they are without knowledge of the facts and conclusions alleged in lines 8 to 25 (to the comma), both inclusive, and they deny the facts and conclusions alleged in lines 25 (from the comma) to 32, both inclusive, of page 10.

6. Answer Article VI:

They state that they are without knowledge of the facts and conclusions alleged therein except that there is and for some time has been a substantial movement by water of traffic of various kinds to and from Portland, Oregon, and that lumber and other forest products are now transported and in the past have been transported by water in substantial volume from Coos Bay, Oregon.

7. Answering Article VII:

They admit the facts alleged in paragraph 15 but explain in that connection that the line of the Great Northern Railway Company from Bend to Chemult intersects the route of said cross-State line at a point about 18 miles northerly from Chemult and about 21 miles easterly from Crescent Lake.

They admit the facts alleged in paragraph 16.

They admit the facts alleged in paragraph 17.

They admit the facts alleged in paragraph 18 but explain in connection therewith that said Oregon Trunk Railway serves no part of the territory adjacent to said cross-State line.

They admit the facts alleged in paragraph 19.

They admit the facts alleged in paragraph 20 but explain in connection therewith that the lines of said Oregon Electric Railway lie wholly west of the Cascade Mountains and do not extend into any part of the territory that would be adjacent to said cross-State line.

With respect to paragraph 21—

They aver that some of said "the northern lines" have physical connections with some of the others and that they all carry on interstate commerce and that they all are subject to the interstate commerce act and that they are parties to certain through routes and joint rates, fares, and charges, and except as herein explained they state that they are without knowledge of the facts and conclusions alleged in paragraph 21.

141a 8. Answering Article VIII:

With respect to paragraph 22—

They state that they are without knowledge of the cost to the Oregon Trunk Railway of its railroad to Bend or of its investment therein or of the cost to the Des Chutes Railroad Company of its railroad line in the Deschutes River Canyon or of its investment therein, but they admit each and every other fact alleged therein.

With respect to paragraph 23—

They aver that said Oregon Trunk Railway and said Des Chutes Railroad Company serve parts of the counties of Deschutes, Jefferson, Wasco, and Sherman in the State of Oregon. They deny that said two lines of railway serve or that either of them serves any part of Wheeler County, Oregon, or any considerable part of Crook County, Oregon. They state that they are without knowledge of the facts and conclusions alleged in lines 17 (from the semicolon) to 18 (to the semicolon), both inclusive, of paragraph 23. They admit the facts alleged in lines 19 to 22, both inclusive, of paragraph 23. They state

that they are without knowledge whether said lines have been operated for eighteen years last past and whether said operations have been or are consistently attended with operating deficits each year or afford no return to the owners of said lines upon their investment therein, but in this connection they explain that said Des Chutes Railroad Company's line of railroad is a branch line of the petitioner herein and is a valuable feeder with the traffic originated thereon to the petitioner and to its connections, the Oregon Short Line Railroad Company and the Union Pacific Railroad Company in the Union Pacific's system of railroads, and that said Oregon Trunk Railway's line of railroad is a branch line of the Spokane, Portland & Seattle Railway Company and is a valuable feeder with the traffic originated thereon to the Spokane, Portland & Seattle Railway Company and to its connections and parent lines, the Great Northern Railway Company and the Northern Pacific Railway Company, and that the worth and value of said Des Chutes Railroad Company and of said Oregon Trunk Railway can not be judged or estimated fairly from the results of their operations as wholly separate and purely independent properties apart from their affiliations with their connections and parent lines. They admit the facts alleged in lines 25 (from the semicolon) to 28, both inclusive, of paragraph 23.

142a 9. Answering Article IX:

With respect to paragraph 24—

They admit the facts alleged therein but aver by way of explanation that the railroad extensions described therein have long been projected and that more than four years ago the Interstate Commerce Commission authorized the Oregon, California and Eastern Railway Company to construct said extensions but that said Oregon, California and Eastern Railway Company has failed and neglected to proceed with the construction of the extensions so projected and authorized and that neither the projected nor the constructed lines of said Oregon, California and Eastern Railway Company serve, or would serve, any part of the territory adjacent to said cross-State line but that its existing line and the projected lines when constructed will constitute important feeders for the said cross-State line, after it shall have been built, and they state that they are without knowledge whether the authorization granted for the construction of said extensions is valid, subsisting, and outstanding or has lapsed or has been withdrawn.

With respect to paragraph 25—

They state that they are without knowledge of the facts and conclusions alleged therein.

With respect to paragraph 26—

The admit the facts alleged therein.

10. Answering Article X:

They admit the facts alleged in paragraph 27 and in paragraph 28 except that they state that they are without knowledge at what ex-

pense the railroads comprising said Union Pacific system have been constructed, developed, and built up to their present standards.

With respect to paragraph 29—

They admit the facts alleged in lines 30 and 31 thereof on page 15. They admit that the Union Pacific Railroad Company has not owned during any of the times mentioned in the petition and that it does not now own any railroad within the State of Oregon, but in this connection they aver and explain that the Union Pacific Railroad Company owns and controls and at all times herein mentioned has owned and controlled the Oregon Short Line Railroad Company and

143a that said Oregon Short Line Railroad Company now owns and controls and at all times herein mentioned has owned and controlled the Oregon-Washington Railroad & Navigation Company or its predecessor, Oregon Railroad & Navigation Company, and that said Oregon Short Line Railroad Company and said Oregon-Washington Railroad and Navigation Company or its predecessor, Oregon Railroad & Navigation Company, during all the times herein mentioned have owned and/or operated various lines of railroad within the State of Oregon and that said lines of railroad within the State of Oregon as now owned and/or operated by said Oregon Short Line Railroad Company and by said Oregon-Washington Railroad & Navigation Company aggregate in length 2,365 miles, more or less. They admit the facts alleged in lines 1 (from the semicolon) to 10 (to the semicolon), both inclusive, of paragraph 29 on page 16. They state that they are without knowledge whether the railroad mileage of the petitioner as owned and operated by it represents a cost to the petitioner and an investment therein by it of $173,000,000 or of any amount in excess thereof. They state that they are without knowledge of the facts and conclusions alleged in lines 13 (from the semicolon) to 20 (to the semicolon), both inclusive, of paragraph 29 on page 16, but by way of explanation they aver that the losses, if any, resulting during the past ten years from the petitioner's operations have not been and are not due to its loss of the bulk or of any part of the western Oregon business as alleged in paragraph 4 of the petition but are and have been due in part to the apathy and failure and lethargy and neglect of the petitioner actively and persistently and perseveringly to solicit the movement of western Oregon traffic via its Portland gateway, and in part to the failure and neglect of the petitioner to complete the construction of said cross-State line in accordance with the provisions of its original articles of incorporation as aforesaid and to put the same into operation and actively to solicit business from and to points in western Oregon for movement over the cross-State line, and that the construction of said cross-State line and the active solicitation by the petitioner of western Oregon business for movement thereover would enable the petitioner largely to increase the volume of its western Oregon business and greatly to augment its revenues and to earn a fair return upon the aggregate value of its railroad property held

for and used in the service of transportation. They state that they are without knowledge of the facts and conclusions alleged in lines 20 (from the semicolon) to 23 (to the semicolon), both inclusive, of paragraph 29 on page 16. They admit that the petitioner's principal interchange of east and west bound traffic is made with
144a the Oregon Short Line Railroad Company at Huntington, Oregon, and they aver that the movement of petitioner's eastbound and westbound traffic through Huntington, Oregon, has preponderated for a number of years and now preponderates to a substantial extent eastbound and except as thus explained they deny that the movement of said traffic has for years preponderated and does now preponderate heavily eastbound.

With respect to paragraph 30—

They admit the facts alleged in lines 27 to 32, both inclusive, on page 16, and in line 1 (through the word "existing"), on page 17, and they deny that the route and service afforded by said Union Pacific system lines between points in eastern and southeastern Oregon and southern and southwestern Idaho on the one hand and Los Angeles and tributary territory via Salt Lake are shorter in distance or in any respect more efficient than will be the route between said points via said "cross-State line," when the same shall have been constructed.

11. Answering Article XI:

They admit the facts alleged in lines 6 to 15 (to the period), both inclusive, on page 17. They state that they are without knowledge of the facts and conclusions alleged in lines 17 (from the period) to 22 (to the period), both inclusive, on page 17. They admit the facts alleged in lines 22 (from the period) to 25 (to the semicolon), both inclusive, on page 17. They deny that by reason of the control of the Central Pacific Railway Company by the Southern Pacific Company or otherwise access by petitioner via said Oregon eastern route to western Oregon traffic and to its terminal at Portland was cut off and that no substantial traffic was left or available for the remaining part of said route from Odell to Vale, and they aver by way of explanation in this connection that the petitioner now has and long has had access to western Oregon traffic by means of a through route via Portland and of joint rates with the Southern Pacific Company, and that with the construction of said cross-State line, which will complete the unfinished portion of said Oregon eastern route, the petitioner will have further access to western Oregon traffic by means of a through route via Crescent Lake and of joint rates with the Southern Pacific Company, and that at no time has petitioner's access to its terminal at Portland been cut off and that with the construction of said cross-State line there will be traffic (both local and through) in substantial volume that will be routed thereover. They state
145a that they are without knowledge of the facts alleged in lines 29 to 32, both inclusive, on page 17 and of lines 1 and 2 (to the period) on page 18, but in this connection, and by way of explana-

tion they aver that the petitioner's line of railroad from Ontario, Oregon, to Crane, Oregon, is the completed part of the main line of railroad projected by Oregon Eastern Railway Company about the year 1905 to extend westerly from Ontario, Oregon, to Natron, near Eugene, Oregon, and that the original articles of incorporation of the petitioner herein were dated November 23, 1910, and that section first of Article III thereof declared the enterprise, business, pursuit, or occupation of the petitioner to be "to purchase, acquire, own, hold, construct, complete, equip, maintain, and operate the railroads, railroad property, and telegraph lines hereinafter mentioned with their appurtenances and to carry freight and passengers thereon and to receive tolls for such carriage and in all things and in every lawful manner to exercise the powers, privileges, franchises, and functions of a railroad company and of a common carrier in respect to each and all of such lines, to wit:

"18. That part of the railroad and telegraph lines projected and proposed to be constructed by Oregon Eastern Railway Company consisting of (a) a line from Vale across the State of Oregon to a point at or near Odell in said State; (b) a line from a point in Christmas Valley, in the State of Oregon, on said line from Vale to Odell, thence through Silver Lake Valley and through Chewaucan Valley and Goose Lake Valley to a point on the boundary line between California and Oregon in township forty-eight (48) north, range 14 east of Mt. Diablo meridian; (c) a line from Bend, in said State of Oregon, to Odell in said State"; and that the petitioner herein on November 8, 1923, by a resolution duly adopted by its board of directors provided for the extension of its line from Crane to Burns and authorized the construction, maintenance, and operation of such extension and therein adopted the said extension as a branch of its existing line of railway and that the petitioner herein on July 11, 1928, and more than one year after the complaint in said docket No. 19680 was filed with the Interstate Commerce Commission filed supplementary articles of incorporation and thereby amended paragraph 18 aforesaid of section first of Article III of the original articles of incorporation to read as follows:

"18. The line of railroad and telegraph extending from Vale in Malheur County to Burns in Harney County, both in the State
146a of Oregon"; and that Burns, Oregon, is not and never was the designated and intended terminus of said projected main line of railroad, and that said cross-State line was and is the uncompleted portion of said projected main line of railroad. They state that they are without knowledge of the facts and conclusions alleged in lines 2 (from the period) to 8, both inclusive, on page 18.

12. Answering Article XII:

They admit that a line of railroad has been constructed from Burns to Seneca, Oregon, and except as thus admitted they state that they are without knowledge of the facts and conclusions alleged therein but in this connection and by way of explanation they aver

that said Oregon and Northwestern Railroad serves no part of the territory adjacent to said cross-State line.

13. Answering Article XIII:

They admit that a line of railroad has been constructed from Rogerson, Idaho, to Wells, Nevada, and is being operated by said Oregon Short Line Railroad Company and that said Rogerson-Wells line connects with the railroads of the Southern Pacific Company and of the Western Pacific Railroad Company at Wells, Nevada. They deny that the route between points in southern Idaho, and southeastern Oregon on the one hand and San Francisco Bay points and tributary territory on the other via said Rogerson-Wells line is a more efficient route than will or can be afforded by said cross-State line and that the same is not unreasonably long as compared with the route that would be afforded by the construction and operation of said cross-State line and that much or any heavier traffic is immediately tributary to said Rogerson-Wells line than will be tributary to said cross-State line in Oregon. They aver that said line from Rogerson to Wells is an extension in a southerly direction from a line of the Oregon Short Line Railroad Company traversing and serving extensive and productive areas of irrigated land in the Twin Falls, Minidoka, Burley, and Hillsdale districts in south central Idaho and was constructed for the express purpose of serving the Twin Falls, Minidoka, Burley, and Hillsdale districts of south central Idaho and to enable the producers of said districts to market their products in the San Francisco Bay district in California by a shorter route than theretofore existed via McCammon, Idaho, and Ogden, Utah. They further aver that said line from Rogerson and Wells was not constructed for the purpose of serving the producing areas of southwestern Idaho and/or of southeastern Oregon and that said districts have received
147a and can receive substantially no benefit from said line. They further aver that the distances from southwestern Idaho and southeastern Oregon to San Francisco Bay points via said Rogerson-Wells line are unduly and unreasonably circuitous in comparison with the distances between the same points via said cross-State line. They further aver that by reason of infrequent trains, of numerous transfers of cars from one local train to another at the several junction points, and of generally inferior service afforded thereover said Rogerson-Wells line is of no considerable value to the area which it was designed to serve and is entirely uselesss for the handling of traffic from southwestern Idaho and/or southeastern Oregon to San Francisco Bay points or elsewhere. Except as thus admitted or denied they state that they are without knowledge of the facts and conclusions alleged in Article XIII.

14. Answering Article XIV:

They aver that the map mentioned therein depicts incompletely and incorrectly the topographical features of the territorial areas purported to be shown thereon and exaggerates grossly and magni-

fies out of all proportion the mountainous or semi-mountainous parts of the State of Oregon in comparison with similar parts of the States of Washington, California, Nevada, Utah, Idaho, Montana, and Wyoming, and as thus explained they admit the facts alleged therein.

15. Answering Article XV:

Except as may have been admitted specifically hereinbefore they deny the facts and conclusions alleged in lines 31 and 32 of paragraph 35 on page 19 and in lines 1 to 12 (to the period), both inclusive, of paragraph 35 on page 20, but in this connection and by way of explanation they aver that many shippers in western Oregon and in southeastern Oregon and southwestern Idaho would divert, route, and receive large quantities of freight via the said cross-State line, if the same were built and operated. They deny that the evidence adduced upon the hearing of said docket No. 19680 and contained in the record thereof before the Interstate Commerce Commission established or demonstrates without dispute or otherwise the facts (or any of them) alleged in paragraphs (a) to (n), both inclusive, on pages 20 to 25, both inclusive, of the petition except as may be admitted or explained specifically hereinafter. They aver with respect to said paragraph (a) that the Southern Pacific Company lawfully can be required to interchange the traffic originated by it
148a in western Oregon with the petitioner at Crescent Lake without financial detriment to it or to the petitioner or to the latter's connections and that such interchange at Crescent Lake is only one of many reasons and considerations calling for the construction and operation of said cross-State line and justifying the same, and that the petitioner, the Southern Pacific Company, the Great Northern Railway Company and the other common carriers by railroad mentioned in the petition are required by law to manage and to operate their properties honestly, efficiently, and economically, and that with respect to traffic between western Oregon and Ogden, Utah (including points east of Ogden), the petitioner and the Southern Pacific Company could both operate over said cross-State line much more honestly, efficiently, and economically than via any existing route and that the Southern Pacific Company and the Great Northern Railway Company would disregard and violate their legal obligations to operate honestly, efficiently, and economically, if they declined voluntarily to interchange business at Crescent Lake with said cross-State line, after it had been built, and lawfully could be required to make such interchange and that the petitioner and its affiliated Union Pacific system lines serve for the most part territory not reached by the lines of the Great Northern Railway Company and that said last-named company would have no motive for refusing voluntarily to deliver to said cross-State line its business from Klamath Falls and Bend destined to points on the Union Pacific system's lines not competitive with the Great Northern Railway Company, and except as in this statement explained they deny the facts and conclusions alleged in said paragraph (a).

With respect to paragraph (b) on pages 20 and 21—

They aver that the construction of said cross-State line is sought and is required to meet the demands of public convenience and necessity for the following reasons, namely:

(1) To facilitate and to make possible the development of a vast area of the territory of the State of Oregon.

(2) To exploit and to utilize the available natural resources of such undeveloped area and its extensive possibilities for producing traffic for a railroad across the State of Oregon.

(3) To provide for much of the freight and passenger traffic
149a (both interstate and intrastate) handled from and to points in Oregon direct routes in lieu of the existing unduly and unreasonable circuitous routes.

(4) To save much money and time that now are lost to the shipping and traveling public through being compelled to use those circuitous routes and to pay rates and fares based on the distances thereover.

(5) To provide the opportunity for effecting largely increased economy and efficiency in handling the lumber of the Willamette Valley moving to eastern destinations.

(6) To eliminate the excessive and unreasonable delay to which the products of the State of Oregon and of the ten southwestern counties of Idaho are now subjected in considerable part in reaching the principal seaports and consuming markets of Oregon and California.

(7) To mitigate the severity of car shortages in Oregon that have recurred periodically in the past and the losses therefrom that have been suffered by shippers.

(8) To accord to interior Oregon the benefits of reasonable competition between railroads in the matter of the service and facilities of transportation due to be accorded by them and to afford interior Oregon adequate outlets for its products to markets in California and in western Oregon.

Except as thus explained they deny the facts and conclusions alleged in said paragraph (b).

With respect to paragraph (c) on page 21—

They deny the facts and conclusions alleged therein except that they admit that one of the purposes of the complainant in said docket No. 19680 was and is to obtain competitive railroad service in western Oregon. They further aver by way of explanation that through interchange of traffic with the Southern Pacific Company and with the Great Northern Railway Company at Crescent Lake, or in the vicinity thereof, the petitioner will receive sufficient traffic for said cross-State line to make unnecessary any further construction by it over and across the Cascade Mountains and into and through the areas of western Oregon and over and across the Coast Range of mountains to the Pacific coast but that should said petitioner desire to construct such further extensions for the purpose of

increasing its traffic and revenues, there are available for its use three or more practicable and economical routes into and through virgin and unserved areas rich in natural resources to western Oregon and to the Pacific coast.

150a With respect to paragraph (d) on page 21—

They aver that when said cross-State line shall have been built and put into operation local traffic produced by the territory traversed by it and accessible thereto and through traffic ("through" meaning not originating between the termini) will move thereover in volume sufficient to contribute substantially to its support and amply to justify its construction, and except as thus explained they state that they are without knowledge of the facts and conclusions alleged in paragraph (d) on page 21.

With respect to paragraph (e) on pages 21 and 22—

They admit that a few products of the ten southwestern counties in Idaho and of Malheur County, Oregon (where irrigation is commonly practiced), are similar in character to those raised and produced in western Oregon (where irrigation is not practiced commonly), but in this connection they aver by way of explanation that many other products thereof are diverse in character from those of western Oregon and that by reason of substantial differences in soil, topography, elevation, rainfall, temperature, and climate generally between western Oregon on the one hand and the ten southwestern counties of Idaho and Malheur County, Oregon, on the other, there is no universal or general or comprehensive similarity of the products of the two respective areas nor will there be in the future nor do such of the products of the two respective areas as are of like kind mature at the same season of the year and therefore are not competitive with each other in the markets in California or elsewhere. They deny that the products of the ten southwestern counties in Idaho and of Malheur County, Oregon, are or will continue to be similar in character to those raised and produced in the State of Washington. They deny that the products of the ten southwestern counties in Idaho and of Malheur County, Oregon, to find market in San Francisco Bay communities must compete with the products of western Oregon and Washington. They admit that the distance from some points of origin in western Oregon to San Francisco Bay market is shorter than the distance would be from southwestern Idaho and Malheur County points of origin via said cross-State line, and except as thus admitted they state that they are without knowledge of the facts and conclusions alleged in lines 22 (from the comma) to 28 (to the semicolon), both inclusive, on page 21. They aver that western Oregon readily could sustain a much larger population and that the construction of said cross-State line would

151a stimulate the growth of population in western Oregon and that the actual production of western Oregon is considerably below its capacity to produce and that its present production exceeds local demand or ability to consume and that Portland is a large city

and commercial and industrial center in western Oregon and that it is and will continue to be able along with the rest of western Oregon to consume a substantial volume of the products of southern Idaho and to afford a market therefor, and except as thus explained they state that they are without knowledge of the facts and conclusions alleged in lines 28 (from the semicolon) to 32, both inclusive, of page 21 and of line 1 (to the semicolon) of page 22. They admit that there are producing areas in the southern part of Lake and Klamath Counties in Oregon and in central California and they aver that at the hearing of said docket No. 19680 substantial evidence respecting the consuming capacity of San Francisco Bay markets was offered by these interveners, was received and was not rebutted, and except as thus admitted and explained they state that they are without knowledge of the facts and conclusions alleged in lines 1 (from the semicolon) to 6 (to the semicolon), both inclusive, of page 22. They deny the facts and conclusions alleged in lines 6 (from the semicolon) to 12, both inclusive, of page 22.

With respect to paragraph (f) on page 22 they aver that, if said cross-State line should be constructed, the production of lumber in Oregon, Washington, or Idaho or in the western or Pacific coast country in general would not be stimulated thereby but that the lumber industry in said States would benefit greatly therefrom, and except as thus explained they deny the facts and conclusions alleged in lines 19 (from the comma) to 22 (to the period), both inclusive, on page 22, and they aver that the other facts alleged in said paragraph (f) are too sweeping as applied to the lumber industry generally in the territory described in lines 13 and 14 on page 22, but as thus explained are substantially correct, and that said cross-State line would afford to the manufacturers of lumber in Oregon a substantially shorter and more economical route and a materially expedited service (in comparison with the existing service) for the shipment of their products to markets east of Ontario, Oregon, and thereby would enable them better to compete in selling their products in said markets and that said cross-State line would also provide necessary facilities of transportation for the marketing of timber which by reason of overmaturity, disease, fire hazard, or the financial situation of its owners must be marketed,

if at all, in the immediate future and will be vitally essen-
152a tial to carry the substantially increased volume of lumber

which producers in Oregon will be called upon to supply within the reasonably near future.

They deny the facts and conclusions alleged in paragraph (g) on pages 22 and 23.

With respect to paragraph (h) on page 23—

They aver that the case of the complainant in said docket No. 19680 contemplated a railroad of a quality of construction suitable to serve as an auxiliary main line of the petitioner between Huntington, Oregon, and points in western Oregon and the operation of

such trains and the furnishing of such service thereupon and thereover as will result in the maximum of efficiency and economy in the transportation of traffic local to said cross-State line and of through traffic between points in western Oregon and points east of Ontario, Oregon, and of Ogden, Utah, and except as herein explained they deny the facts and conclusions alleged in lines 2 to 5 (to the semicolon), both inclusive, on page 23. They deny that traffic is or can be transported over the main lines of the petitioner, of the Oregon Short Line Railroad Company, of the Los Angeles and Salt Lake Railroad Company, of the Southern Pacific Company, and of the Central Pacific Railroad Company via Portland and Huntington, via Alturas, via Wells, or via Ogden and Salt Lake with frequency, speed, and efficiency that are very much or at all greater via the said cross-State line in connection with the Ontario-Crane line of the petitioner, but they admit with respect to the allegations contained in lines 5 (from the semicolon) to 13 (to the semicolon), both inclusive, of page 23 that said main lines have been built up at considerable but not unusual expense and are maintained generally speaking at reasonably good standards of quality, efficiency, and safety in respect of roadbed, tracks, structures, facilities, and appurtenances and in this connection they aver by way of explanation that said main lines (with the exception of the Los Angeles and Salt Lake Railroad Company) can be operated with substantially greater efficiency and economy after the said cross-State line shall have been constructed than is possible now or than will be possible until such construction is completed. They state that they are without knowledge of the facts and conclusions alleged in lines 13 (from the semicolon) to 15 (to the semicolon), both inclusive, on page 23, but they aver in this connection by way of explanation that petitioner's line from Ontario to Crane
153a was constructed as an auxiliary main line for handling traffic between western Oregon and points east of Ontario, Oregon, and that if it be not suitable now for main-line business, it can be improved and rehabilitated readily and without undue expense so that it may serve as an auxiliary main line for the petitioner. They state that they are without knowledge of the facts and conclusions alleged in lines 15 (from the semicolon) to 18, both inclusive, of page 23, but they aver in this connection by way of explanation that the illustration given therein is not typical or fairly representative of the utility of said cross-State line but is abnormal and misleading and that it never was and is not now proposed or suggested by these interveners that said cross-State line should be built to provide a new route between Ontario and Portland for traffic to be transported between those two points.

They state that they are without knowledge of the facts and conclusions alleged in paragraph (i) on page 23.

With respect to paragraph (j) on pages 23 and 24 they admit that Boise is located in the southwestern part of Idaho on the main line

of the Oregon Short Line Railroad Company and that the distance therefrom via said cross-State line and the Southern Pacific Company to San Francisco would be 911 miles and via Wells, Nevada, and the Southern Pacific Company is 968 miles and that the distance from Boise to Los Angeles via Oregon Short Line Railroad Company and Los Angeles and Salt Lake Railroad Company is 1,204 miles and via said cross-State line and the Southern Pacific Company would be 1,375 miles and they aver that the service of transportation afforded by the Union Pacific system via Wells, Nevada, and thence over the Southern Pacific Company lines is infrequent, inadequate, unreasonable, and unsatisfactory and that by reason thereof said route is not as a practical matter available for the shipment of products from southwestern Idaho to San Francisco and that substantially no traffic to and from points in southwestern Idaho is routed via Wells, Nevada, and that the shortest available route over which regular and daily service is now afforded from southwestern Idaho to San Francisco bay points is via Ogden, Utah, over which route the distance from Boise to San Francisco is 1,149 miles and that the greater portion of the territory in southwestern Idaho which said cross-State line would serve lies westerly from Boise, Idaho, and that the saving in distance from said points in southwestern Idaho west of Boise via said cross-State
154a line would be substantially greater than the saving in distance from Boise and that construction of said cross-State line is not now sought and has not been sought by these intervening defendants to provide a shorter route from southwestern Idaho to Los Angeles but that said cross-State line would afford a new route to Los Angeles through San Francisco, which new route would give to the producers and shippers of southwestern Idaho and of southeastern Oregon opportunity to try the markets of San Francisco Bay and other northern California points and then to divert their shipments to Los Angeles, if market conditions made such diversion desirable, without any substantial increase in the length of the haul in comparison with the existing routes to Los Angeles, and except as thus admitted or explained they state that they are without knowledge of the facts and conclusions alleged in said paragraph (j).

They state that they are without knowledge of the facts and conclusions alleged in paragraph (k) on page 24, but in this connection they aver by way of explanation that Crescent Lake is a division point on the main line of the Southern Pacific Company running in a general northerly and southerly direction through western Oregon and that weather conditions during the winter at that point do not interfere materially with the efficiency of the Southern Pacific Company's operations and would not interfere with an efficient interchange of traffic there between said cross-State line and the Southern Pacific Company.

With respect to paragraph (l) on page 24—

They admit that certain irrigation projects in Oregon are involved in debt, but by way of explanation they aver that it was established at the hearing in said docket No. 19680 that substantial progress has been made and is being made by the several officers and departments of the State of Oregon in refinancing and rehabilitating such irrigation projects in eastern and central Oregon as have been involved in financial difficulties and that within the near future said projects will have been placed on a sound and economical financial basis and that from the standpoint of engineering and finance said projects are inherently sound and practicable or can be made so, and aside from the financial embarrassment experienced by some of them in recent years said projects are entirely justified and in accordance with good economics. Except as thus admitted they state that they are without knowledge of the facts alleged in paragraph (l).

155a With respect to paragraph (m) on page 24—

They state that they are without knowledge of the facts and conclusions alleged in lines 18 to 25 (to the semicolon), both inclusive, thereof, and they admit the facts alleged in lines 25 (from the semicolon) to 28, both inclusive, thereof, but they aver in this connection and by way of explanation that such facts are without legal significance in this cause and that likewise Baker, Oregon, and Pendleton, Oregon, are nearer to Portland via the petitioner's line than they would be via said cross-State line and the Southern Pacific Company's lines, and that Portland is not a fairly representative point in western Oregon, by reference to which alone the benefits that would accrue to all of western Oregon from the said cross-State line can be measured.

They state that they are without knowledge of the facts and conclusions alleged in paragraph (n) on pages 24 and 25, but in this connection and by way of explanation they aver that said cross-State line will afford a valuable opportunity to shippers of livestock to Pacific coast destinations to divert them en route to Portland, or to Puget Sound points or to San Francisco Bay points, or to Los Angeles without any back-haul or out-of-line haul, and that the markets for livestock at Portland and Puget Sound are limited and are easily broken to the serious disadvantage and loss of producers and shippers in eastern Oregon and southern Idaho of livestock and that San Francisco Bay points and Los Angeles are extensive consumers of livestock and are important markets for livestock and are satisfactory and desirable markets for the livestock produced in eastern Oregon and southern Idaho, but that under existing conditions and transportation routes said markets are not readily accessible to the livestock producers of eastern Oregon and of southern Idaho by reason of long and circuitous hauls over heavy mountain grades with heavy shrinkage in the weight of the animals shipped and consequent large financial loss to said producers and shippers, and that the construction of said cross-State line would afford to said

producers and shippers of livestock a short, direct, economical, and practical route for the carriage of livestock to San Francisco Bay points, which route would afford to said producers and shippers the additional important advantage of enabling them to start their shipments westbound and on or before their arrival at Crescent Lake to divert the same to the market found to be most desirable and profitable and that shipments so diverted toward Portland might later be diverted on to Puget Sound and shipment so diverted
156a south via the Southern Pacific Company's lines, if not sold at a satisfactory price at San Francisco Bay points, might be diverted on to the markets of southern California and that the ability of livestock shippers so to ship and divert their livestock constitutes a great advantage to them and a substantial saving in the marketing thereof and that the shrinkage on shipments to San Francisco Bay points by reason of said shorter and less mountainous route via said cross-State line would be lessened to the extent of approximately $68.00 a car of cattle so shipped.

They deny the facts and conclusions alleged in paragraph 36 of the petition.

16. They deny the facts and conclusions alleged in Article XVI of the petition.

17. They deny the facts and conclusions alleged in Article XVII of the petition.

18. Answering Article XVIII:

They deny the facts and conclusions alleged in paragraph 39 and in this connection and by way of explanation they aver that the order made in said docket No. 19680 by the Interstate Commerce Commission did not require the petitioner to provide the Umpqua or Rogue River Valleys or any other territory located west of the Cascade Mountains with the facilities for transportation by railroad nor to build branch or feeder lines from said cross-State line.

With respect to paragraph 40—

They admit lines 26 to 30 (to the comma), both inclusive, on page 27, and they admit that said cross-State line would proceed in a different direction than does the petitioner's line from Crane to Burns, and except as thus admitted they deny the facts and conclusions alleged in paragraph 40 of the petition, and in this connection and by way of explanation they aver that petitioner's line from Crane to Burns is a branch from the uncompleted auxiliary main line of the petitioner from Vale to a point at or near Odell and that said auxiliary main line and its completion as aforesaid were up to July 11, 1928, a project of the petitioner as set forth in its original articles of incorporation and that the construction of said cross-State line would finish the now uncompleted part of said auxiliary main line of the petitioner and would constitute an extension thereof within the meaning of paragraph 21 of section 1 of the interstate commerce act and that said auxiliary main line would have remained to this day a project of the petitioner set forth as

aforesaid in its articles of incorporation except for the filing and prosecution of the complaint in said docket No. 19680, as a
157a result of which the petitioner's articles of incorporation were amended as alleged in paragraph 1 of this answer.

They aver that paragraph 21 of section 1 of the interstate commerce act was enacted as a part of section 402 of the transportation act, 1920 (41 Statutes at Large, 476, 477, 478), and that besides providing therein for the compulsory extension of the line or lines of a railroad said section 402 provided, and still provides, that a railroad desiring to extend its line or lines or to abandon all or any part of a line must first obtain from the Interstate Commerce Commission a certificate that the present or future public convenience and necessity require the construction and operation or the abandonment (as the case may be) of such extension or line, and said section 402 also contained, and still contains, numerous provisions relating to car service, joint use of terminals, and other matters, and that the authority and power of the Interstate Commerce Commission by virtue of said paragraph 21 of section 1 of the interstate commerce act include compelled extensions of the line or lines of a railroad, whether in the immediate territory entered or occupied by its railroad and local to its existing line and railroad enterprise or outside of such territory and beyond it, and except as herein explained they deny the facts and conclusions alleged in paragraph 41 of the petition.

19. Answering Article XIX:

They aver that J. P. Newell is, and for many years last past has been, a civil engineer of national and international standing and reputation and that the Public Service Commission of Oregon employed him to prepare a transportation cost study covering the route of said cross-State line to and from western Oregon in comparison with the then existing route via Roseville, California, and with the then contemplated route (since completed) via Alturas, California, and that he prepared in minute detail a voluminous document or treatise embracing the results of such study, and that the same was introduced in evidence at the hearing in said docket No. 19680 in connection with oral testimony given by said Newell and along with divers other exhibits in writing prepared by him, and that besides said Newell the complainant in said docket No. 19680 called numerous other witnesses and that much testimony given and many exhibits prepared by such other witnesses were offered and received in evidence at the hearing in said docket No. 19680 in support of the complaint therein, and except as thus admitted or explained they deny the facts and conclusions alleged in lines
158a 31 and 32 (on page 28) of paragraph 42 and in lines 1 to 11 (to the period), both inclusive, on page 29 thereof. They aver that it was established at the hearing in said docket No. 19680 that after the construction of said cross-State line a large part of the traffic between points served by the Southern Pacific Company and its connections in western Oregon and points east of Ogden, Utah,

could be interchanged at Crescent Lake for transportation over said cross-State line and said Union Pacific system's lines much more efficiently and economically and at a greater net earning to all of the participating carriers than via any other route and that most of the present traffic between points in the 10 counties in southwestern Idaho and San Francisco, California, and points adjacent thereto could be moved via the said cross-State line after its construction much more efficiently and economically and at a greater net earning to all of the participating carriers than by any existing route, and except as thus explained they deny the facts and conclusions alleged in lines 11 (from the period) to 19 (to the period), both inclusive, on page 29 of said paragraph 42. They admit the facts alleged in lines 19 (from the period) to 32, both inclusive, on page 29, and of lines 1 to 32, both inclusive, on page 30, and in lines 1 to 16, both inclusive, of page 31, but they aver in this connection and by way of explanation that the quoted portions of said Newell's testimony (considered alone and apart from the rest of his testimony and from his exhibits and from all the other evidence in the record in said docket No. 19680) give a grossly incomplete and misleading picture and impression of the showing made by the complainant therein and that the findings and order of the Interstate Commerce Commission in said docket No. 19680 were not based solely or substantially upon the quoted parts of said Newell's testimony, and that said quoted testimony was given by said Newell during the early part of the hearing in said docket No. 19680 and before said Newell was informed concerning the estimated tonnage over said cross-State line between points in southwestern Idaho and northern California and before said Newell was informed concerning the voluntary routing via said cross-State line of traffic by shippers in western Oregon, and that after having given the quoted testimony aforesaid, and after being informed concerning said traffic, said Newell prepared and introduced in evidence a study and exhibit marked "Complainant's Exhibit No. 107, Witness Newell," which exhibit, along with other things, contained the following statement: "Diversion of the entire traffic of western Oregon to the cross-State line is not required
159a in order to provide the new route with sufficient traffic to justify it. If there be no compulsory interchange between the carriers at Crescent Lake, a considerable part of the traffic which I have claimed for the new line would be subject to competition between the carriers. * * * Any arrangement whereby the cross-State line can be assured of one-half of the traffic which might otherwise be carried via Alturas or Roseville will, in my opinion, justify an order by the Interstate Commerce Commission for its building."

With respect to paragraph 43—

They aver by way of explanation that at the hearing in said docket No. 19680 elaborate and detailed estimates of both transcontinental and local traffic over said cross-State line were made by witnesses

Teutsch, Wiggins, and others and that the results of these estimates were used by said Newell in his testimony and exhibits and that said estimates were not based upon speculation but upon the volume of movement of existing traffic between western Oregon and points east of Ogden, Utah, and upon the volume of production and consumption (past, present, and prospective) in areas of territory that would be tributary to said cross-State line or that could be reached most efficiently and economically and by the shortest route via the same and were conservative and not inflated and that they believe that the figures in carloads of such traffic and in dollars and in percentage (15.5 per cent) of the earnings therefrom are set out correctly in said paragraph 43.

They further aver that through development of agricultural and industrial pursuits naturally incident to the growth of the State of Oregon upon the completion of said cross-State line a volume of traffic substantially equal to or greater than that now originating in the counties of western Oregon should and would move over said cross-State line and that said traffic would not consist principally of tonnage diverted from the lines of the Southern Pacific Company, but, on the contrary, would constitute principally traffic created by reason of the construction of said cross-State line as the result of its competitive influence and of its substantially shorter and more economical route to important markets for western Oregon products. Except as thus explained or admitted they state that they are without knowledge of the facts and conclusions alleged in said paragraph 43.

With respect to paragraph 44—

They deny the facts and conclusions alleged, and by way of
160a explanation they aver that it was established upon the hearing of said docket No. 19680 that the petitioner has joined with the Oregon Trunk Railway in the ownership and/or operation of a line or of lines of railroad along the Deschutes River between Bend and Sherman, Oregon, and that it is feasible and practicable for the petitioner to extend such joint ownership and/or operation to the tracks of the Great Northern Railway Company from Bend to Chemult, Oregon, or to its junction with said cross-State line, or as an atlernative to acquire trackage rights by which lumber and other traffic originating at Bend may be transported by it to and over said cross-State line and that the proposed route to and over said cross-State line would be shorter, more practicable, more efficient and more economical for the handling of traffic originating at Bend, or in that vicinity, and destined to points on the Union Pacific system east of Huntington, Oregon, than by petitioner's existing route and that by so routing said traffic the petitioner would avoid the difficult and expensive operating conditions over the Blue Mountain grades and that substantial savings would result to petitioner thereby and that by reason of said economy it would be to the interest of the petitioner so to route a substantial part of its tonnage originating on its said railroad at Bend and in that vicinity.

With respect to paragraph 45—

They admit the facts alleged in lines 24 to 32, both inclusive, on page 32, but in this connection and by way of explanation they aver that said quoted provision of the interstate commerce act is intended to prevent the short-hauling of an originating carrier to its financial detriment and that a compulsory interchange at Crescent Lake between said cross-State line and the Southern Pacific Company would not short-haul any of the Union Pacific system lines and would short-haul the Southern Pacific Company but only to its financial and pecuniary benefit and advantage in comparison with its net earnings for interchange as at present at Ogden, Utah, and they admit the allegations contained in lines 1 to 5 (to the second comma) both inclusive, on page 33, and they state they are without knowledge of the facts and conclusions alleged in lines 5 (from the second comma) to 8, both inclusive, on page 33, but by way of explanation they aver that honest, efficient, and economical management would require the routing over said cross-State line of a substantial part of the tonnage originating in western Oregon when destined to points on the lines of the Union Pacific system and its connections east of Ogden, Utah, and that substantially increased net
161a revenues to the Southern Pacific Company and to the Union Pacific system lines would result from routing said traffic via said cross-State line and would cause the Southern Pacific Company, the Great Northern Railway Company, the Oregon Short Line Railroad Company, and the petitioner voluntarily so to route said tonnage. They further aver that by reason of shortened distances and improved service thereover the shippers of western Oregon would route voluntarily a substantial portion of said traffic over said cross-State line and that the financial interests of the petitioner would prompt and impel it to solicit traffic actively and persistently in western Oregon for routing over said cross-State line.

With respect to paragraph 46—

They state that they are without knowledge of the facts and conclusions alleged in lines 9 to 12 (to the comma), both inclusive, of page 33, and they deny the facts and conclusions alleged in lines 12 (from the comma) to 17, both inclusive, of page 33.

20. Answering Article XX:

They admit the facts alleged in line 20 to 22 (to the comma), both inclusive, on page 33, and they aver by way of explanation that it was established at the hearing that the petitioner after the construction of said cross-State line could route its traffic from Bend, Oregon, to points east of Ontario, Oregon, more efficiently and more economically via said Bend-Chemult line and via said cross-State line than via the existing route through Sherman, Oregon, and Huntington, Oregon, and except as thus explained they state that they are without knowledge of the facts and conclusions alleged in lines 22 (from the comma) to 27, both inclusive, on page 33.

21. Answering Article XXI:

With respect to paragraph 48—

They aver that witness Newell in his testimony and exhibits in said docket No. 19680 included no portion of western Oregon traffic that can move more economically eastbound via the Portland gateway and petitioner's line than would be possible via said cross-State line, and except as thus explained they state that they are without knowledge of the facts and conclusions alleged in line 32 on page 33 and in lines 1 to 5 (to the period), both inclusive, on page 34. They admit the facts alleged in lines 5 (from the period) to 7, both inclusive, on page 34. They aver that the allegations
162a contained in lines 8 to 15 (to the period) on page 34 are inadequate to portray or to reflect the substance of the testimony and evidence given at the hearing in said docket No. 19680 by the witnesses for the complainant therein in support of their estimates of the tonnage that would be produced and move over said cross-State line, and for greater certainty they refer to such testimony and evidence in their entirety, the contents of which the petitioner well knows. They aver that the construction of said cross-State line will result in the reclamation of large areas of lands now semiarid and that a reasonably adequate supply of water for the growing of crops and for the sustaining of livestock can then be obtained and applied thereon, and that said lands can then be settled and homes can then be established thereon, and that crops and livestock can then be produced successfully thereon and that adequate consuming markets justifying the transportation of such products now exist and will exist in the future, and that the rehabilitation, refinancing, and settlement of reclamation projects in central and eastern Oregon on a successful basis can be effected, and except as thus explained they deny the facts and conclusions alleged in lines 8 to 15 (to the period) on page 34. They state that they are without knowledge of the facts and conclusions alleged in lines 15 (from the period) to 17 (to the semicolon), both inclusive, on page 34, except that they aver in this connection that the Oregon Short Line Railroad Company serves far more territory in the State of Idaho than any other railroad. They admit the facts alleged in lines 17 (from the semicolon) to 27 (to the period), except that they aver by way of explanation that tonnage from all of said 17 different counties in Oregon would be accessible to said cross-State line either through lines of railroad of the petitioner or of the connections by railroad of the petitioner and that all of said 17 counties are or could be served by the petitioner through its own local rates or through joint rates made by it with its connections. With respect to the facts and conclusions alleged in lines 27 (from the period) to 32, both inclusive, on page 34, and in lines 1 to 9 (to the period), both inclusive, on page 35, they aver that the movement of a very large part of the traffic of all 17 of said counties (including Malheur, Harney, and Lake) over said cross-State line would be in accordance with natural laws, with the

interstate commerce act, and with long standing and accepted practices of railroads generally in conducting transportation, and except as thus explained they deny said facts and conclusions. They aver that the Southern Pacific Company and the Great
163a Northern Railway Company operate lines of railroad in Klamath County, and that after the construction of said cross-State line a substantial volume of traffic from Klamath County could be routed thereover more efficiently and economically than via any other route, and except as thus explained they deny the facts and conclusions alleged in lines 9 (from the period) to 13, both inclusive, of page 35. They aver that Deschutes County is the source of a heavy volume of traffic for the existing railroads paralleling the Deschutes River and that said cross-State line would traverse the northern parts of Lake and Klamath Counties and that Deschutes County lies immediately north of Klamath and Lake Counties and that a substantial volume of traffic from Deschutes County would be available for said cross-State line and could and would move thereto and thereover, and that Crook County lies within a few miles of the northern boundary line of Lake County and that Jefferson and Wheeler Counties lie from fifty to sixty miles north of said cross-State line, and except as thus explained they state that they are without knowledge of the facts and conclusions alleged in lines 14 to 16, both inclusive, of page 35. They deny that the Blue Mountain Range intervenes between said cross-State line and Wheeler County, and they aver that traffic in appreciable volume from Wheeler County would be available for said cross-State line and could and would move thereto and thereover, and except as thus denied and explained they state that they are without knowledge of the facts and conclusions alleged in lines 17 to 21 (to the period), both inclusive, of page 35. They aver that traffic in appreciable volume from Baker County would be available for said cross-State line and could and would move thereto and thereover, and they admit that Baker County is traversed by the petitioner's main line of railroad and that a branch line of petitioner extends for some miles along the eastern boundary of Baker County, and that a part of the line of the Sumpter Valley Railroad Company lies in Baker County, and except as thus admitted or explained, they state that they are without knowledge of the facts and conclusions alleged in lines 21 (from the period) to 27 (to the period), both inclusive, on page 35. They aver that traffic in appreciable volume from Grant County would be available for said cross-State line and that for twelve or fifteen miles the line of Oregon and Northwestern Railway Company serves a very small part of Grant County, and except as thus explained they admit the facts alleged in lines 27 (from the period) to 29 (to the period), both inclusive, of page 35. They
164a aver that the main line of railroad of the Southern Pacific Company between Eugene, Oregon, and Klamath Falls, Oregon, crosses the Cascade Range of Mountains and thus provides access

by railroad from western Oregon to said cross-State line, and that the Coast Range of Mountains in western Oregon is crossed by three branch lines of the Southern Pacific Company, and that the distance from Crescent Lake, the proposed western terminus of said cross-State line, to Powers in the southern part of Coos County, near the boundary line of Curry County, is more than two hundred and fifty miles, but that said route is extremely circuitous and that a very much shorter route via Chiloquin, Oregon, in Klamath County, Butte Falls, and Medford in Jackson County, and Grants Pass and Waters Creek in Josephine County is feasible and is partly completed and in operation and eventually will be completed. As thus explained, they admit the facts alleged in lines 29 (from the period) to 32, both inclusive, on sheet 35, and in lines 1 to 3, both inclusive, on page 36.

They aver that the complainant in said docket No. 19680 at the hearing therein called as one of its witnesses H. F. Wiggins and that said Wiggins then was and had been for years an expert in matters relating to rates, traffic, and transportation and that said Wiggins compiled elaborate and detailed exhibits containing estimates of revenue to be derived by said cross-State line from its traffic, and the same were received in evidence as explained by said Wiggins, and that the data, statistics, and information constituting the basis of said estimates of revenue so computed by said Wiggins were furnished to him by the Southern Pacific Company (such data, statistics, and information not being in dispute or contested upon the hearing in said docket No. 19680), and by the detailed and comprehensive estimates (received in evidence in the form both of exhibits and of oral testimony at the hearing in said docket No. 19680) of production, consumption, and markets made by Witness Teutsch and by other witnesses at said hearing, and except as thus explained they deny the facts and conclusions alleged in lines 4 to 11 (to the period) of page 36. They aver that said Witness Newell in the preparation of some of his exhibits used the data, information, and statistics supplied as aforesaid by said Southern Pacific Company and much other data, information, and statistics relating to the traffic and operations of the petitioner and of the Oregon Short Line Railroad Company and some of the estimates of said Wiggins and of said Teutsch and much other statistical data and mate-

165a rial and that each and every item of traffic included in the estimates of the witnesses on behalf of the complainant in said docket No. 19680 was vouched for, supported and affirmed by the evidence of one or more witnesses familiar with the facts and competent to testify concerning the same, and that said witnesses showed that the volume of traffic estimated by said Newell and by said Wiggins, or a substantially greater volume of traffic, would move over said cross-State line, and that such movement would be practicable and would be required in the interest of public convenience and necessity, and except as thus explained they deny every fact and conclusion contained in lines 11 (from the period) to 29,

both inclusive, of page 36 and they also deny that the petitioner's deductions from said Newell's testimony and exhibits are correct, and they aver that said allegations with respect thereto are wholly inadequate fairly to portray or to reflect the same, and for greater certainty they refer to the testimony and exhibits of said Newell in their entirety, the contents of which the petitioner well knows.

22. Answering Article XXII:

They aver that the case of the complainant in said docket No. 19680 was and is based upon the issues tendered by the complaint therein, of which only one out of eight concerned large economies and savings to be accomplished by the movement of Western Oregon traffic over said cross-State line as compared with its movement over the Southern Pacific Company's route to Ogden either via Roseville or via Alturas, and that at the hearing in said docket No. 19680 said witness Newell undertook to establish by proof, and did so establish, said issue, and that the allegations contained in paragraph 50 of the petition are inadequate to portray or to reflect the testimony and evidence of said Newell in establishing said issue, and for greater certainty they refer to said testimony and evidence in their entirety, the contents of which the petitioner well knows, and except as thus explained they deny the facts and conclusions alleged in said paragraph 50.

23. Answering Article XXIII:

They deny that in or by its report in said docket No. 19680 the Interstate Commerce Commission made findings unsupported by evidence or contrary to the undisputed evidence therein or contrary to facts of common knowledge or of judicial cognizance.

They aver that after the conclusion of the hearing in said docket No. 19680 the Alturas line of the Southern Pacific Company
165a was completed and was put into operation, and that the route between western Oregon and Ogden, Utah, via said Alturas line is 214 miles longer than the route via said cross-State line and that subsequent to the filing of the complaint in said docket No. 19680 the Southern Pacific Company applied for permission to construct its said Alturas line, and after the hearing in said docket No. 19680 actually finished its construction and placed said line in operation, and that at the time of said application for authority to construct its Alturas line the Southern Pacific Company was fully informed that complainant in said docket No. 19680 would seek an order from the Interstate Commerce Commission requiring the construction of said cross-State line for the purpose, along with others, of providing a better route for the shipment of products originating at, and destined to, points in western Oregon and that the complainant in said docket No. 19680 appeared before the Interstate Commerce Commission in the proceedings wherein the Southern Pacific Company sought permission to construct its Alturas line, and in said proceedings again informed the Southern Pacific Company and the Interstate Commerce Commission of its intention to urge

and to demand the construction of said cross-State line and further informed the Southern Pacific Company and the Interstate Commerce Commission that the proposed Alturas line was not a reasonable or satisfactory substitute for said cross-State line, and except as thus explained they admit the facts alleged in paragraph (a) on page 38, and they aver that the quoted allegation is true and was based on substantial evidence.

They aver that the allegation quoted in lines 20 to 22, both inclusive, on page 38 (which they admit the Interstate Commerce Commission's report contains) is true and was based on substantial evidence, and that the movement of traffic in substantial volume from eastern Oregon and from southwestern Idaho to southwestern Oregon points has been prevented in the past by the extremely circuitous route via Huntington and Portland and by the rates in effect thereover and will be so prevented in the future until the said cross-State line shall have been built and put into operation and except as thus admitted or explained they deny the facts and conclusions contained in pargraph (b) on page 38.

They aver that the allegation quoted in lines 29 to 31, both inclusive, of page 38 (which they admit the Interstate Com-
167a merce Commission's report contains) is true and was based on substantial evidence, and except as thus admitted or explained they deny the facts and conclusions alleged in paragraph (c).

They admit that the Interstate Commerce Commission made the finding quoted in paragraph (d) and they aver that the same is true and was based on substantial evidence, and that in relation to the area of the State of Oregon to be served, railroad construction therein has been greatly limited and restricted, and they state that they are without knowledge of the cost of existing railroad construction in Oregon and of the facts and conclusions alleged in lines 7 to 9, both inclusive, on page 39, and they deny that said finding of the Interstate Commerce Commission is an arbitrary finding or conclusion or is contrary to the facts.

They admit that the Interstate Commerce Commission made the finding quoted in paragraph (e), and they aver that the same is true and was based on substantial evidence and that the territory which would be affected by said cross-State line is not served and never has been served by existing railroads, and except as thus admitted or explained they deny the facts and conclusions alleged in said paragraph (e).

They admit that the Interstate Commerce Commission made the finding quoted in paragraph (f), and they aver that the same is true and was based on substantial evidence, and except as so admitted or explained they deny the facts and conclusions alleged in said paragraph (f).

They admit that the Interstate Commerce Commission made the finding quoted in paragraph (g), and they aver that the same is

true and was based on substantial evidence, and except as thus admitted or explained they deny the facts and conclusions alleged in said paragraph (g).

They admit that the Interstate Commerce Commission made the finding quoted in pargraph (h), and they aver that the same is true and was based on substantial evidence, and except as thus admitted or explained they deny that the facts and conclusions alleged in said paragraph (h) are true for any or all the reasons alleged or for any other reason.

They admit that the Interstate Commerce Commission made the finding quoted in paragraph (i), and they aver that the same is true and was based on substantial evidence, and except as thus admitted or explained they deny the facts and conclusions alleged in said paragraph (i).

168a With respect to paragraph (j)—

They deny the facts and conclusions alleged in lines 7 to 15 (to the comma), both inclusive, on page 40. Of the facts and conclusions alleged in lines 15 (from the comma) to 21 (to the semicolon), both inclusive, on page 40, they state that they are without knowledge and therefore they deny the same. They aver that cattle were driven from Harney County to Winnemucca, Nevada, before the railroad to Burns was constructed and before the Rogerson-Wells line was completed, and except as thus explained they deny the facts and conclusions alleged in lines 21 (from the semicolon) to 27 (to the semicolon), both inclusive, on page 40. They deny the facts and conclusions alleged in lines 27 (from the semicolon) to 31 (to the semicolon), both inclusive, on page 40. They aver that Alkali Lake is located within 12 or 15 miles of said cross-State line and that it would be feasible to build a branch line of railroad from said cross-State line to said Alkali Lake at comparatively low cost and that with the construction of said branch the development of the mineral salt deposits of Alkali Lake would be practicable and that the initial shipments therefrom would amount to not less than three carloads a day and that production and shipments would thereafter increase and that the same would constitute an unfailing source of traffic indefinitely into the future, and except as thus explained they deny the facts and conclusions alleged in lines 27 (from the semicolon) to 32, both inclusive, on page 40 and in lines 1 to 5 (to the semicolon), both inclusive, on page 41. They deny the facts and conclusions alleged in lines 5 (from the semicolon) to 8, both inclusive, on page 41. They aver by way of explanation that the pumping of water for irrigation in the territory adjacent to said cross-State line has been prevented from material expansion largely by reason of lack of railroad transportation facilities, which facilities would be afforded by the construction of said cross-State line. They aver that during the years 1909 to 1912 approximately 2,000 homesteaders settled upon agricultural lands in Harney and Lake Counties contiguous to the route of said cross-State line, upon the holding out of the petitioner

that it would begin the construction of said cross-State line and that said homesteaders made substantial improvements upon the lands homesteaded, built homes, barns, and fences and stocked their said homesteads with livestock and continued to live upon and to farm said homesteads for several years, but that by reason of the failure and neglect of the petitioner to construct said cross-State line, as announced and promised, said homesteaders were unable profitably to market their products, and because of this fact substantially all of them were forced to abandon and did abandon their said homesteads and improvements to their serious loss, detriment, and disadvantage.

169a

They admit that the Interstate Commerce Commission made the finding quoted in paragraph (k) and they aver that the same is true and was based on substantial evidence, and except as thus admitted or explained they deny that the facts and conclusions alleged in said paragraph (k) are true for the reason therein alleged or for any other reason.

They aver that California affords one of the principal markets for the products of the 10 counties of southwestern Idaho; they admit that parts of southwestern Idaho are semi-arid and they aver that there is successful production in said section both through dry farming and by means of irrigation and that such production will be largely increased upon the completion of the Owyhee and Vale irrigation projects now under construction, and that in respect of soil, climate, elevation, rainfall, products and natural resources generally, southwestern Idaho and the territory that would be tributary to the said cross-State line are essentially similar and except as thus admitted or explained they state that they are without knowledge of the facts and conclusions alleged in said paragraph (l).

They deny the facts and conclusions alleged in paragraph (m) on page 42.

They deny the facts and conclusions alleged in paragraph (n) on page 42.

They admit that the Interstate Commerce Commission made the finding quoted in paragraph (o) and they aver that the same is true and was based on substantial evidence, and except as thus admitted or explained they deny the facts and conclusions alleged in said paragraph (o) on page 42.

They deny that the facts and conclusions alleged in paragraph 52 on page 42 are true for any reason or reasons therein alleged or for any other reason.

24. Answering Article XXIV:

They state that they are without knowledge whether the Interstate Commerce Commission considered said docket No. 19680 and made its report and order therein under the conceptions and theories of the law applicable thereto as alleged in paragraphs (a) to (j), both inclusive, of paragraph 53 or in any of said paragraphs, and therefore they deny the facts and conclusions alleged in said para-

170a graph 53 and they aver that the allegations of said paragraph 53 are inadequate to portray or to reflect in full or at all the Interstate Commerce Commission's conceptions and theories of the law applicable to the issues in said docket No. 19680, and for greater certainty they refer to the Interstate Commerce Commission's report and order in said docket No. 19680 in their entirety, the contents of which the petitioner well knows.

With respect to paragraph 54—

They state that they are without knowledge of the facts and conclusions alleged in lines 31 and 32 on page 45 and in lines 1 to 4 (to the semicolon), both inclusive, on page 46, and, therefore, they deny the same and they deny the facts and conclusions alleged in lines 4 (from the semicolon) to 17, both inclusive, on page 46.

25. Answering Article XXV:

They admit that the cost of constructing and equipping said cross-State line will exceed $9,000,000; they deny the facts and conclusions alleged in lines 21 to 28 (to the comma), both inclusive, on page 46 and in lines 29 (from the semicolon) to 31 (to the semicolon), both inclusive, on page 46, and they deny the facts and conclusions alleged in lines 31 (from the semicolon) and 32, on page 46, and in lines 1 to 12, both inclusive, on page 47.

26. Answering Article XXVI:

They admit the facts and conclusions alleged in lines 13 to 18, both inclusive, on page 48, and deny that the remaining facts and conclusions alleged in paragraph 56 are true for the reasons stated therein or for any other reasons.

27. Answering Article XXVII:

They deny that the facts and conclusions alleged in paragraph 57 are true for all or any of the reasons therein stated or for any other reason.

28. Answering Article XXVIII:

They admit that petitioner's operations extend into Portland, Oregon, and into Tacoma, Seattle, Spokane, Walla Walla, and Yakima, Washington, and except as thus admitted they state that they are without knowledge of the facts and conclusions alleged in lines 31 and 32 on page 48 and in lines 1 to 20 (to the semicolon), both inclusive, on page 49; they deny that the facts and conclusions alleged in lines 20 (from the semicolon) to 25, both inclusive, are true for the reasons set out in paragraphs (a) to (f), both inclusive, or in any of them, of paragraph 58 or for any other

171a reason; they aver that to construct said cross-State railroad would cost approximately $9,000,000, and except as thus explained they state that they are without knowledge of the facts and conclusions alleged in paragraph (a) on page 49, and, therefore, they deny the same; they deny the facts and conclusions alleged in paragraphs (b) and (c) on pages 49 and 50; they aver that said cross-State line, if constructed in compliance with the order of the Interstate Commerce Commission in said docket No. 19680, would

constitute an auxiliary main line of the petitioner west of Ontario, Oregon, and an integral part of the petitioner's system of railroad and of the Union Pacific system lines, and except as thus explained they deny the facts and conclusions alleged in paragraph (d) on page 50; they state that they are without knowledge of the facts and conclusions alleged in paragraph (e), and, therefore, they deny the same; they admit the facts alleged in paragraph (f) on page 50; and they deny the conclusion alleged in paragraph 59.

Further answering, they aver that the matters and things set forth in the petition and sought to be put in issue before this court were all before the Interstate Commerce Commission in said docket No. 19680 and were fully heard and determined by it and were within its power and authority to hear and to determine under the provisions of the interstate commerce act and that in its report in writing which was made after full hearing and on due notice to all of the parties, which report states its conclusions together with its decision, order, or requirement in the premises, the matters and things of which complaint is made were fully considered by the Interstate Commerce Commission and were foreclosed by its findings of fact based on substantial evidence, of which the parties were advised.

They aver that the facts set forth in the Interstate Commerce Commission's report and order sought to be set aside, annulled, suspended, and enjoined and each and all of the same are true and correct.

Defendants specifically deny (a) any fact or facts in the petition or any part of the same which denies or deny or which seeks or seek to deny any fact or facts found by the Interstate Commerce Commission; (b) any fact or facts alleged in the petition or any part of the same which is or are inconsistent with any fact or facts found by the Interstate Commerce Commission, (c) any and all inferences of fact from any particular fact or facts alleged in the petition or in any part of the same which seeks or seek to deny or which is or are inconsistent with any facts or facts found by the Interstate Com-
172a merce Commission; (d) any fact or facts alleged in the petition or in any part of the same which sets up or set up or which seeks or seek to set up matters and things which were not before the Interstate Commerce Commission; (e) any fact or facts alleged in the petition or any part of the same which attacks or attack or which seeks or seek to attack the action of the Interstate Commerce Commission and to show facts other than those which the Interstate Commerce Commission has found and declared; (f) any allegations in the petition or in any part of the same which aver that facts were found by the Interstate Commerce Commission in its report and order which, as shown on the face thereof, were not so found; (g) any conclusions of law alleged and insisted upon in the petition or in any part of the same which are inconsistent with any conclusions of law held by the Interstate Commerce Commission; and (h) each and every allegation in the petition contained not herein specifically admitted or denied.

Wherefore, having fully answered, these intervening defendants pray that the petition be dismissed at the cost of the petitioner and for such other and further order as may be appropriate.

I. H. VAN WINKLE,
Attorney General of Oregon,
WILLIAM C. MCCULLOCH,
WM. P. ELLIS,
Solicitors for Public Service Commission of Oregon.
W. D. GILLIS,
Attorney General of Idaho,
J. M. THOMPSON,

DEPARTMENT OF JUSTICE,
OFFICE OF THE ASSISTANT TO THE ATTORNEY GENERAL,
Washington, September 15, 1930.

GEORGE H. MARSH, Esq.,
Clerk, United States District Court,
Portland, Oregon.

Oregon-Washington Railroad & Navigation Company *v.* United States. Eq. No. 9113–E

DEAR SIR: This is to acknowledge the receipt on this date from William C. McCulloch, Esq., of copy of petition filed in the above-entitled case by him on behalf of the Public Service Commission of Oregon and Public Utilities Commission of the State of Idaho for leave to intervene, a true copy of the court's order permitting the interventions sought, and copy of answer filed by those interveners.

We have been advised that the case is definitely set for hearing before the specially constituted district court of three judges of September 29, 1930.

Yours very truly,

ELMER B. COLLINS,
Special Assistant to the Attorney General.

Filed September 20, 1930. G. H. Marsh, clerk, United States District Court, District of Oregon.

174a INTERSTATE COMMERCE COMMISSION,
OFFICE OF THE CHIEF COUNSEL,
Washington, September 15, 1930.

Hon. G. H. MARSH,
Clerk of the United States District Court for the District of Oregon,
Portland, Ore.

Re: Oregon-Washington R. & N. Co. *v.* United States. In equity E–9113

DEAR SIR: The Interstate Commerce Commission has to-day been served by Mr. William C. McCulloch with copy of petition of Public Service Commission of Oregon and of Public Utilities Commission of Idaho, for leave to intervene in the above-entitled suit, copy of the order of District Judge Bean permitting the intervention, and copy of the answer of said interveners. This is for the purpose of advising you that said service has been made upon us.

Very truly yours,

DANIEL W. KNOWLTON, *Chief Counsel.*

Filed September 20, 1930. G. H. Marsh, clerk, United States District Court, District of Oregon.

175a [Omitted]

176a In United States District Court

[Title omitted.]

Answer of the Public Service Commission of Oregon and of Public Utilities Commission of the State of Idaho, intervening defendants, to the petition in intervention of Southern Pacific Company

Filed September 29, 1930

These intervening defendants (averring that the order of the Interstate Commerce Commission in its docket No. 19680, enforcement of which is sought to be enjoined in and by this suit, did not and does not run in whole or in part against the Southern Pacific Company, and that the Southern Pacific Company has no standing in its own right to demand or to be accorded the relief sought and claimed in its petition in intervention, but not waiving the benefit of said averment or their rights thereunder by their specific admission, denial, denial for lack of knowledge or explanation as hereinafter alleged of the facts, conclusions, matters, and things contained in the petition in intervention of the Southern Pacific Company) for their answer to the petition in intervention of Southern Pacific Company say:

1. Answering Paragraph I:

They admit the facts alleged in Paragraph I.

2. Answering Paragraph II:

They admit the facts alleged in line 6 to 9 (to the comma), both inclusive, on page 2, and they aver that the order made by the Interstate Commerce Commission in its docket No. 19680 did not run and does not run in whole or in part against the Southern

177a Pacific Company and that the interest of the Southern Pacific Company in said docket No. 19680 terminated with the entry

of the decision of the Interstate Commerce Commission in said docket No. 19680 and in the making and entry of the order of the Interstate Commerce Commission in said docket No. 19680 on December 3, 1929, and except as thus explained state that they are without knowledge of the facts and conclusions alleged in lines 9 (from the comma) to 11 (to the period), both inclusive, on page 2. They state that they are without knowledge of the facts and conclusions alleged in lines 11 (from the period) to 15 (to the period), both inclusive, on page 2.

3. Answering Paragraph III:

They aver that the lines of railroad mentioned in lines 22 to 31, both inclusive, on page 2 are main lines in the same sense as the extension would be when built, the construction of which was required by the Interstate Commerce Commission in its order in said docket No. 19680, and as thus explained they admit the facts alleged in Paragraph III.

4. Answering Paragraph IV:

They state that they are without knowledge of the facts and conclusions alleged in Paragraph IV.

5. Answering Paragraph V:

They admit the facts alleged in lines 12 to 32 (to the comma), both inclusive, on page 3. They state that they are without knowledge of the facts and conclusions alleged in line 32 (from the comma) on page 3, and in line 1 on page 4.

6. Answering Paragraph VI:

They admit the facts alleged in lines 3 to 19, both inclusive, on page 4. They state that they are without knowledge of the facts and conclusions alleged in lines 19 (from the semicolon) to 22 (to the semicolon), both inclusive, on page 4. They admit the allegations contained in lines 22 (from the semicolon) to 32, both inclusive, on page 4, and in lines 1 to 4 (to the semicolon), both inclusive, on page 5. They aver that the route afforded by the Southern

178a Pacific Company for transcontinental business between western Oregon and points Ogden and east via its Cascade line, Klamath Falls, Alturas, Wendel, and Ogden is, between western Oregon points and eastern points, a route that is materially and substantially more direct and efficient than the Southern Pacific's alternate route via Roseville, California, between the same points of origin and destination, and that the route between the same points of origin and destination via the cross-State line required to be built by the order under attack in this suit would be materially and substantially more direct and efficient and economical than the Southern Pacific Company's route between the same points of origin and destination via its Cascade line, Klamath Falls, Alturas, Wendel, and Ogden, and except as thus explained they deny the facts and conclusions alleged in lines 4 (from the semicolon) to 9 to the semicolon), both inclusive, on page 5. They deny the facts and conclusions alleged in lines 9 (from the semicolon) to 11, both inclusive, on page 5.

7. Answering Paragraph VII:

They admit that a substantial volume of railroad traffic moving from western Oregon originates on the lines of Southern Pacific Company, and except as thus explained they deny the facts and conclusions alleged in lines 13 and 14 (to the semicolon), both inclusive, on page 5. They state that they are without knowledge of the facts and conclusions alleged in lines 14 (from the semicolon) to 17 (to the semicolon), both inclusive, on page 5. They admit the facts alleged in lines 17 (from the semicolon) to 19 (to the semicolon), both inclusive, on page 5. They admit, subject to check, the facts alleged in lines 19 (from the semicolon) to 26 (to the semicolon), both inclusive, on page 5. They state that they are without knowledge of the facts and conclusions alleged in lines 26 (from the semicolon) to 29 (to the semicolon), both inclusive, on page 5. They admit the facts alleged in lines 30 to 32, both inclusive, on page 5 and in lines 1 to 3 (to the semicolon), both inclusive, on
179a page 6. They admit, subject to check, the facts alleged in lines 3 (from the semicolon) to 16 (to the semicolon) both inclusive, on page 6. They state that they are without knowledge of the facts and conclusions alleged in lines 16 (from the semicolon) to 20 (to the semicolon), both inclusive, on page 6. They state that they are without knowledge of the facts and conclusions alleged in lines 21 to 28, both inclusive, on page 6.

8. Answering Paragraph VIII:

They deny the facts and conclusions alleged in lines 30 to 32, both inclusive, on page 6, and in lines 1 to 10 (to the period), both inclusive, on page 7, and in this connection they aver by way of explanation that the Southern Pacific Company's route from points in western Oregon via Klamath Falls and Alturas to Ogden, Utah, and to points east thereof is practicable and not unreasonably long as compared with the through route for such traffic over the Southern Pacific Company's line to Portland, Oregon, and thence over the lines of the Oregon-Washington Railroad & Navigation Company, the Oregon Short Line Railroad Company, and the Union Pacific Railroad Company, and that neverthless the Southern Pacific Company now has and for years past has had with the Oregon-Washington Railroad & Navigation Company, the Oregon Short Line Railroad Company, and the Union Pacific Railroad Company a through route and joint rates thereover via Portland, Oregon, for such traffic and that by the maintenance of said through route and joint rates via Portland, Oregon, the Southern Pacific Company voluntarily has waived in the past and now waives the retention to its own rails by it of the long haul on eastbound transcontinental traffic originating in western Oregon. With respect to the allegations contained in lines 10 (from the period) to 21, both inclusive, on page 7 they aver that upon the completion of said cross-State line the establishment of a through route thereover and over the lines of the Southern Pacific

Company and of joint rates via such through route would be
180a demanded in the public interest and by public convenience and necessity and that the establishment and use of such through route and of such joint rates thereover upon the same basis and in the same volume or amount as the joint rates contemporaneously in effect via the through route by way of Klamath Falls and Alturas would enable the Southern Pacific Company to operate its lines with substantially greater honesty, efficiency, and economy with respect to traffic originating in western Oregon than via its route through Alturas or via its alternative route through Roseville and would enable the Southern Pacific Company to make greater net earnings from its business to and from points in western Oregon than it could make by transporting the same via any other route, and except as thus explained they deny the facts and conclusions alleged in lines 10 (from the period) to 21, both inclusive, on page 7.

9. Answering Paragraph IX:

They state that they are without knowledge of the facts and conclusions alleged in lines 23 to 30 (to the period), both inclusive, on page 7. They aver that the volume of westbound traffic received by the Southern Pacific Company at Ogden and destined to western Oregon is smaller than the volume of traffic originating in western Oregon and delivered to the Union Pacific Railroad Company at Ogden, and except as thus explained they state that they are without knowledge of the facts and conclusions alleged in lines 30 (from the period) to 32, both inclusive, on page 7, and in lines 1 and 2 on page 8. They deny the facts and conclusions alleged in lines 3 to 8, both inclusive, on page 8.

10. Answering paragraph X:

They deny that the facts and conclusions alleged therein are or that any one of them is true for the reasons therein set forth or for any other reason and they aver that the Southern Pacific Company has no standing in its own right to set up or to make the allegations of fact and conclusions contained in Paragraph X of its petition in intervention or any of them with respect to any alleged rights
181a of the Oregon-Washington Railroad & Navigation Company, the petitioner in this suit.

11. Answering Paragraph XI:

They deny that the facts and conclusions alleged therein are or any one of them is true for the reasons therein set forth or for any other reason and they aver that the Southern Pacific Company has no standing in its own right to set up or to make the allegations of fact and conclusions contained in Paragraph XI of its petition in intervention or any of them with respect to any alleged rights of the Oregon-Washington Railroad & Navigation Company, the petitioner in this suit.

12. Further answering, they aver that the Southern Pacific Company has no standing in its own right to seek or to be accorded all or any of the relief sought in the prayer of its petition in interven-

tion and that the right to obtain the relief sought by the Southern Pacific Company in and by its petition in intervention as specified in the prayer thereof is vested solely in the Oregon-Washington Railroad & Navigation Company, the petitioner in this suit.

13. Further answering, they aver that the matters and things set forth in the petition in intervention of the Southern Pacific Company and sought to be put in issue before this court were all before the Interstate Commerce Commission in said docket No. 19680 and were fully heard and determined by it and were within its power and authority to hear and to determine under the provisions of the interstate commerce act and that in its report in writing which was made after full hearing and on due notice to all of the parties, which report states its conclusions together with its decision, order or requirement in the premises, the matters and things of which complaint is made were fully considered by the Interstate Commerce Commission and were foreclosed by its findings of fact based on substantial evidence, of which the parties were advised.

Wherefore, having fully answered, these intervening defendants pray that the petition in intervention of the Southern Pacific
182a Company may be dismissed at the cost of the Southern Pacific Company, and for such other and further order as may be appropriate.

185a In United States District Court for the District of Oregon

No. E–9113. In equity

OREGON-WASHINGTON RAILROAD & NAVIGATION COMPANY, PETITIONER

vs.

UNITED STATES OF AMERICA, DEFENDANT; SOUTHERN PACIFIC COMPANY, Public Service Commission of Oregon, and Public Utilities Commission of Idaho, interveners

Opinion

Filed Jan. 29, 1931

Before RUDKIN and WILBUR, Circuit JJ., and MCNARY, District J.

RUDKIN, Circuit Judge:

May 24, 1927, the Public Service Commission of the State of Oregon filed its complaint with the Interstate Commerce Commission against the Oregon-Washington Railroad & Navigation Company, the Union Pacific Railroad Company, and a number of other railroads, alleging that the carriers named as parties to the proceeding had failed and refused to provide reasonable and adequate facilities of transportation by railroad to a large area within the State of Oregon; that such facilities were reasonably required in the interest of public convenience and necessity; that the expense of providing such facilities will not impair the ability of the carriers to perform their duty to the public, and praying for an order requiring some one or more of such carriers to construct a line of railroad between Crane, Oregon, on the east and Crescent Lake, or some adjacent point on the line of the Southern Pacific Company, on the west. After full investigation and hearing, the Commission made its order requiring the Oregon-Washington Railroad & Navigation Company to extend its line of railroad, now terminating at, or near, Burns, Oregon, to a connection with the Cascade line of the Southern Pacific Company, at, or near, Crescent Lake, Oregon,
and that the Union Pacific Railroad Company be, and it was
186a thereby, authorized to join in the construction and operation
of such extension and to finance if from current funds or by advances. The present proceeding was thereupon instituted in this court by the Oregon-Washington Railroad & Navigation Company, as petitioner, against the United States, as defendant, to set aside, annul and suspend the order of the commission and to permanently enjoin the government, its officers and agents, from enforcing, or attempting to enforce, the same, and for an interlocutory injunction pending the final hearing.

While many incidental and subsidiary questions are discussed in the able and comprehensive briefs filed by the respective parties, there are but two important and controlling questions in the case: First, the authority of the commission to order a railroad extension such as this under any circumstances, and, second, the sufficiency of the testimony to justify or support the order if authority for the same be found to exist.

The general situation may be briefly summarized as follows: The Union Pacific Railroad Company owns all of the capital stock of the Oregon Short Line Railroad Company, and the Oregon Short Line owns all but fifteen shares of the capital stock of the Oregon-Wash-

ington Railroad & Navigation Company. The present line of the Oregon-Washington Company extends from Portland, Oregon, to Huntington, Oregon, where it connects with the Oregon Short Line. The line of the Oregon Short Line extends from Huntington, Oregon, to Ogden, Utah, where it connects with the line of the Union Pacific Company, which extends from Ogden to Omaha, Nebraska. These three lines, together with the line of the Los Angeles and Salt Lake Railroad Company, extending from Salt Lake City, Utah, to Los Angeles, California, make up the Union Pacific System. In 1916 the Oregon-Washington Company completed a branch line from its main line at Ontario, Oregon, to Crane, Oregon, a distance of approximately 127 miles, which has since been operated by the Oregon Short Line under a lease. In 1924 the line in question was further extended to Burns, Oregon, a distance of about 30 miles. The extension now ordered is from a point at, or near, Crane, Oregon,
187a to a point at, or near, Crescent Lake, Oregon, as above stated, a distance of approximately 185 miles, and the estimated cost of the extension is from nine to eleven million dollars.

There is at present but one east and west line of railroad in eastern Oregon, extending along the southerly bank of the Columbia River, which forms the northern boundary of the State in part. A vast area in central and southeastern Oregon is thus left without reasonable or adequate transportation facilities, and the need for a line of railroad in that vicinity is apparent, assuming, of course, that there will be sufficient traffic along and over the line of the proposed road to justify its construction.

On the latter issue, the parties submitted to the commission elaborate and painstaking estimates of the tonnage available and potentially available for the first five years of operation and thereafter together with a like estimate of the revenues to be derived from such operation. These estimates were supported by other testimony and differed widely in their results, generally as much as one hundred per cent and often a great deal more. The traffic estimates furnished by the complainant before the commission showed that the gross revenues derived from operation for the first five years would approximate the entire cost of construction. Speaking generally, the commission accepted these estimates and rejected those offered by the railroad companies. We do not now understand that there is any claim that the extention of the line is not reasonaly required in the interest of public convenience and necessity, if the findings of the commission are supported by the testimony. Indeed, if the petitioner shared the optimism of the State and interstate commissions, we think it reasonably safe to say that the present suit would never have been brought, or even contemplated.

The argument of the petitioner is directed largely against the weight of the testimony submitted by the Oregon Commission before the Interstate Commerce Commission and accepted by that body. If we were at liberty to review this testimony independently of the

findings made by the commission, we might find no little difficulty in reaching the same conclusion. It might well be urged that the hopes and aspirations of those advocating the extension will never be fully realized; that the local traffic from the sparsely settled desert waste through which the line in large part extends will be much less than estimated, and that the traffic from southwestern Idaho to California points, and the traffic diverted from the Southern Pacific at the intersection will fall short of expectations. But we have no such general power of review. If the determination of the commission finds substantial support in the testimony, its findings are conclusive upon the courts, unless the commission has exceeded its power or has proceeded upon an erroneous theory of the law, or unless its action is so manifestly arbitrary and unreasonable as to virtually transcend the authority conferred upon it.

188a

"It is not for courts to weigh the evidence introduced before the commission * * * or to enquire into the soundness of the reasoning by which its conclusions are reached, * * * or to question the wisdom of regulations which it prescribes * * *." (Assigned Car Cases, 274 U. S. 564, 580.)

"But if the determination of the commission finds substantial support in the evidence, the courts will not weigh the evidence nor consider the wisdom of the commission's action." (Chicago, R. I. & P. R. Co. v. United States, 274 U. S. 29, 33.)

"The finding of reasonableness, like that of undue prejudice, is the determination of a fact by a tribunal 'informed by experience.' * * * This court has no concern with the correctness of the commission's reasoning, with the soundness of its conclusions, or with the alleged inconsistency with findings made in other proceedings before it." (Virginian Ry. v. United States, 272 U. S. 658, 665.)

"To consider the weight of the evidence or the wisdom of the order entered is beyond our province." (New England Division Cases, 261 U. S. 184, 204.)

See, also, United States v. Erie R. Co. (280 U. S. 98); Merchants' Warehouse Co. v. United States (44 F. (2d) 379).

In the light of these decisions, it seems quite manifest that the findings of the commission are not without substantial support in the testimony, and beyond this we are not at liberty to inquire.

Section 1, paragraph 18, of the transportation act of 1920 (49 U. S. C. A., sec. 1) provides, among other things, that no carrier by railroad subject to the act shall undertake the extension of its line of railroad, or the construction of a new line of railroad, or shall acquire or operate any line of railroad, or extension thereof, unless and until there shall first have been obtained from the commission a certificate that the present or future public convenience and necessity require or will require the construction, or operation, or construction and operation, of such additional or extended line. Paragraph 21 of the same section provides that the

189a

commission may, after hearing, in a proceeding upon complaint or upon its own initiative without complaint, authorize or require by order any carrier by railroad subject to the act, party to such proceeding, to provide itself with safe and adequate facilities for performing as a common carrier its car service as that term is used in the act, and to extend its line or lines; provided no such authorization or order shall be made unless the commission finds, as to such extension, that it is reasonably required in the interest of public convenience and necessity, or as to such extension or facilities that the expense involved therein will not impair the ability of the carrier to perform its duty to the public.

In the course of its opinion or decision the commission stated abstractly that testimony sufficient to warrant or justify a certificate of necessity under paragraph 18 would likewise warrant or justify an order requiring an extension of a line or lines under paragraph 21, and this ruling is assigned as error. The act of Congress does not attempt to define or prescribe the quantum of proof required in either case, and we need not consider whether the analogy is right or wrong, because, as already stated, the correctness of the reasoning of the commission, or the soundness of its conclusions, are no concern of the courts so long as its findings are supported by substantial competent testimony.

The finding that the expense of the extension will not impair the ability of the petitioner to perform its duty to the public is likewise challenged. If the petitioner is to be considered as a separate entity apart from the Union Pacific system, we do not understand that there is any contention that the cost or expense will not impair its ability to perform its duty to the public. On the other hand, if the commission was warranted or justified in taking into consideration the financial ability of the Union Pacific, we do not understand that there is any contention that the expense of the extension will materially impair the ability of that company to perform its duty to the public. But whether the commission was warranted or justi-

190a fied in taking into consideration the financial ability of the Union Pacific, and in authorizing that company to join in the construction and operation of the extension and to finance it from current funds, or by advances, presents a question of law which we need not consider, in view of our conclusions upon another branch of the case.

A consideration of the facts is not very material, if as a matter of law the Interstate Commerce Commission was without authority to require the carrier to make an extension of its line or lines such as is here involved. But we have deemed a summary of the controlling facts essential in order to comply with the rulings of the Supreme Court in this class of cases. (Railroad Commission *v.* Maxcy, 281 U. S. 82.)

The final question is, then, the authority of the commission to make the order in question under any view of the facts. We have already

given the substance of paragraph 21 of the act. The commission is there empowered to authorize or require a carrier by railroad subject to the act to provide itself with safe and adequate facilities for performing as a common carrier its car service, as that term is used in the act, "and to extend its line or lines." The defendant contends that the language "to extend its line or lines" is too plain to admit of construction; that it was the purpose and policy of the transportation act of 1920 to develop and maintain for the people of the United States an adequate railroad system, and that in ordering the extension of a line or lines the only limitations on the authority of the commission are those found in the act itself, namely, that the extension is reasonably required in the interest of public convenience and necessity and that the expense of the extension will not impair the ability of the carrier to perform its duty to the public.

The petitioner, on the other hand, contends that authority to require the extension of a line or lines is coupled with the authority to require a carrier to provide itself with safe and adequate facilities for performing its car service, as that term is used in the act, and that the only extensions contemplated or authorized were such as would afford adequate transportation facilities to the communities and industries in the territory served by the carrier. The
191a testimony of one of the commissioners before the Committee on Interstate Commerce of the United States Senate lends support to this view. Commissioner Clark there said:

"The thought underlying the second part of this suggestion is that a railroad having been permitted by public franchise, and the powers that go with it, to build into a given territory it should be required to properly serve and develop that territory, and in developed territory it is important to provide for the extension of short branch or spur lines or spur tracks to communities and industries that should be served and that can furnish sufficient traffic to justify such extension. In some States the State officials are authorized to require such extension, but in such cases they are necessarily primarily concerned with, if not confined to, consideration of State traffic. Some of the States have not vested such authority in any State official. Ordinarily, such extension would be desired for the purpose of facilities, or making possible, the transportation of State traffic. The desirability of uniformity is obvious. The exercise of Federal authority should not depend upon whether a State has acted and should not be different as to a State that has legislated on the subject and a State that has not legislated. It, therefore, seems desirable that Congress should extend its jurisdiction in this regard in a plenary way, and that where such extensions are desired in connection with the movement of presently existing or prospective interstate traffic and the carrier is unwilling to construct them it may, upon proper showing and after full hearing, be required to do so by the Federal tribunal." (Hearings before Committee on Inter-

state Commerce, United States Senate, 65th Congress, 3d session, on Extension of Tenure of Government Control of Railroads, vol. 1, p. 233.)

If such was the purpose of the amendment it should be so limited by the courts.

"We repeat, the amendment of 1906 was drawn by and recommended by the commission, and it may be assumed was not intended to have nor given larger import in the law than it had in the recommendation." (United States v. Pennsylvania R. R. Co., 242 U. S. 208, 227.)

While the courts have frequently been called upon to construe the term extension, as employed in Paragraph 18, as distinguished from spur, industrial, team, switching or side tracks, as employed in Paragraph 22, our attention has not been directed to any decision defining or deciding how far a line or lines may be extended within the purview of the extension provisions of the act. In Lancaster v. Gulf C. & S. F. Ry. Co. (298 F. 488, 490) it was said:

"The terms 'extension of line of railroad' and 'industrial track' have no clear and established restrictive definition, either in dictionaries or in railroad practice, which will permit of the case being settled by rule of thumb, but, on the contrary, these terms have a wide latitude of meaning, according to the context in which they are used. Since Congress has not undertaken to define the words used, and since it is plain that they may be, according to the angle of approach, given wide and varied meaning, it is evident that the purpose of the act must be drawn from its entire structure, and that purpose, together with the context in which the words are used, must at the last be the guide to the interpretation of the words at issue."

192a New York and Queens Gas Co. v. McCall (245 U. S. 345) and New York ex rel. Pub. Ser. Com. (269 U. S. 244) are cited in support of the order, but these cases involved orders directing the extension of gas mains, and have little application here. Gas, water, electric current, and telephone service must in the nature of things be brought to the consumer, but this is true of railroads to a limited extent only. Furthermore, the orders complained of in these cases simply required the gas companies to extend their facilities to consumers within the territory which the companies undertook, and were obligated, to serve. Many other cases might be cited, but the orders under consideration were of minor importance when compared with the order in this case. Wisconsin, etc., Co. v. Jacobson (179 U. S. 287) involved an order of the Railroad and Warehouse Commission of the State of Minnesota, requiring two railroad companies whose tracks intersected at a certain point to provide connecting tracks so that the cars of each company could be run onto the tracks of the other; Minneapolis, etc., R. R. v. Minnesota (193 U. S. 53) involved an order of the same commission requiring a railroad company to build and maintain a station house at a certain point on its

line; Atlantic Coast Line v. N. Car. Corp. Comm. (206 U. S. 1) involved an order requiring a railroad company to rearrange its schedules so as to make a convenient connection between its trains and those of another road passing a junction point; Missouri Pacific R. R. Co. v. Kansas (216 U. S. 262) involved an order requiring a railroad in the place of a mixed passenger and freight train; Grand Trunk R. Co. v. Michigan (231 U. S. 457) involved an order requiring various railroads to use their tracks in the city of Detroit for interchange of traffic; Chicago, Milwaukee & St. Paul Ry Co. v. Iowa (233 U. S. 334) involved an order requiring a railroad company to accept shipments of coal in carload lots when tendered in the cars of other railroad companies; Phoenix Ry. Co. v. Geary (239 U. S. 277) involved an order directing a street railroad company to double track its line for a distance of 10 blocks. In the latter case the court added, however: "Complainant is not required to open up new terri-
193a tory, but only to give better service upon a street already occupied by it under a public franchise."

On the other hand, in Atchison, T. & S. F. Ry. Co. v. Railroad Commission (160 Pac. 828) the Supreme Court of California in an able and well-considered opinion, annulled an order of the railroad commission of that State requiring a railroad company to construct a branch line twelve miles in length, holding that it constituted a taking of property without compensation and without due process of law. The court said:

"The issue to be determined is this: Has the railroad commission authority to require a railroad company to extend its line of railroad, or to build a new line, so as to connect with its existing line points that have not theretofore been connected and which the company has not undertaken to so connect? * * * The solution of the problem thus presented must be found in a definition of the character of the order complained of. Is the railroad commission, in ordering the construction of a railroad line, regulating the service which the petitioner has undertaken to give to the public, or is it compelling the railroad company to dedicate its property to a new service. If the former, the commission is acting within its jurisdiction; if the latter, it is attempting to exercise an authority which the statute either has not attempted or is unable to confer upon it. * * * A public utility, undertaking to supply a given public need, submits itself to the regulation and control of public authority with respect to the service which it has thus undertaken. Thus, a water company having a franchise to supply water to the inhabitants of a given city assumes the public duty of supplying that community with water. It may be compelled to extend its mains in order to furnish the service to such inhabitants. * * * So of companies furnishing gas, electric current, or telephone service. (1 Wyman on Pub. Ser. Corp., sec. 797.) But to require a public utility to devote its property to a service which it has never professed to render is to take that property, pro tanto, and such taking

can not be justified except under the power of eminent domain, i. e., upon just compensation. A railroad company, in constructing a line between given points, does not undertake to supply the transportation needs of any territory not reached by its lines. (1 Wyman, Pub. Ser. Corp., sec. 272.)"

And after quoting from Gt. Northern Ry. v. Minnesota (238 U. S. 340) and Chi., Mil. & St. P. R. R. Co. v. Wisconsin (238 U. S. 491) the opinion concluded:

"These quotations point to the essential ground of the invalidity of the order here in question. The supervision of service rendered by a railroad company is a proper matter for public regulation and control. The question whether a railroad company shall extend its lines to points not theretofore reached by it, whether, in other words, it shall engage in a new and additional enterprise, is one of policy to be determined by its directors. To compel a railroad company to apply its property to the construction and operation of a line of railroad which it does not desire to construct or operate is to take its property.

"As we have already indicated, we are cited to no authority which supports the power of the State, acting through its railroad commission, or otherwise, to compel the extension of a railroad line in the manner here attempted. On the contrary, such decisions as have come to our attention tend, rather, to deny the existence of any such power."

See, also, Southern Bell Tel. & Tel. Co. v. Town of Calhoun
194a (287 F. 381); Towers v. United Rys. & Electric Co. (95 Atl. 170); State v. Public Service Commission, 192 S. W. 958).

The views of the California Supreme Court as there expressed find support in many decisions of the Supreme Court of the United States. Thus, in Atlantic Coast Line v. N. Car. Corp. Comn., supra, at page 20, the court said:

"As the public power to regulate railways and the private right of ownership of such property coexist and do not the one destroy the other, it has been settled that the right of ownership of railway property, like other property rights, finds protection in constitutional guarantees, and, therefore, wherever the power of regulation is exerted in such an arbitrary and unreasonable way as to cause it to be in effect not a regulation but an infringement upon the right of ownership, such an exertion of power is void because repugnant to the due process and equal protection clauses of the fourteenth amendment."

And in Nor. Pac. Ry. v. North Dakota (236 U. S. 585, 595) the present Chief Justice said:

"But, broad as is the power of regulation, the State does not enjoy the freedom of an owner. The fact that the property is devoted to a public use on certain terms does not justify the requirement that it shall be devoted to other public purposes, or to the same use on other terms, or the imposition of restrictions that are

not reasonably concerned with the proper conduct of the business according to the undertaking which the carrier has expressly or impliedly assumed. If it has held itself out as a carrier of passengers only, it can not be compelled to carry freight. As a carrier for hire, it can not be required to carry persons or goods gratuitously. The case would not be altered by the assertion that the public interest demanded such carriage. The public interest can not be invoked as a justification for demands which pass the limits of reasonable protection and seek to impose upon the carrier and its property burdens that are not incident to its engagement."

Application of these principles to the case at bar can lead to but one conclusion. One of the dominant purposes of the order complained of was to require the petitioner to construct a line of railroad 185 miles in length in order that lumber traffic originating perhaps hundreds of miles from its present lines might find a shorter route to eastern markets, and that traffic from southwestern Idaho might find a shorter route to northern California points. Thus, the carrier was plainly required to devote its property to a service which it has never professed to render and to a service entirely beyond the scope of the undertaking which it has expressly or impliedly assumed.

195a In this connection our attention has been directed to the fact that the articles of incorporation of the petitioner, as they existed at the time the complaint before the commission was filed, authorized it to purchase, acquire, own, hold, construct, complete, equip, maintain, and operate certain railroads, including "that part of the railroad and telegraph lines projected and proposed to be constructed by the Oregon Eastern Railway Company consisting of (a) a line from Vale across the State of Oregon to a point at or near Odell in said State." Provisions of this kind in articles of incorporation are usually permissive, not contractual, and such is the case here. (Towers v. United Rys. & Electric Co., supra.) Indeed, if the provision was contractual it is not easy to understand how it could be enforced by the Interstate Commerce Commission.

Our conclusion is, then, that the provision of the transportation act of 1920 authorizing the Interstate Commerce Commission to require carriers to extend their line or lines is unconstitutional and void if it must be construed broadly and liberally, as was done by the commission in the present case. But we do not think that such construction is either necessary or permissible. If a statute is susceptible of two constructions, by one of which grave and doubtful constitutional questions arise and by the other of which such questions are avoided, it is the duty of the court to adopt the latter. United States v. Delaware & Hudson Co., 213 U. S. 366, 407; Texas v. Eastern Texas R. R. Co., 258 U. S. 204, 217. The extension provision of the transportation act may therefore well be limited to such extensions as are reasonably necessary to reach communities and industries in the territory which the carrier has professed to

serve or according to the undertaking which it has expressly or impliedly assumed. Such a construction will give full effect to the purpose of Congress and make the act conform to the practice then prevailing in many of the States. When the act is thus construed the order in question exceeds the authority of the commission and is void. Its enforcement must therefore be enjoined, and a decree will be entered accordingly.

[File indorsement omitted.]

197a In United States District Court for the District of Oregon

In equity, No. E–9113

OREGON-WASHINGTON RAILROAD & NAVIGATION COMPANY, PETITIONER

vs.

THE UNITED STATES OF AMERICA, DEFENDANT; SOUTHERN PACIFIC Company, Great Northern Railway Company, Public Service Commission of Oregon, Public Utilities Commission of Idaho, and Interstate Commerce Commission, interveners

Findings of fact and conclusions of law

Filed Jan. 29, 1931

At the November term of the District Court of the United States for the district of Oregon held at the United States Court room in the city of Portland, Oregon, on the 22nd day of January, 1931.

Present: The honorable Frank H. Rudkin, circuit judge; the honorable Curtis D. Wilbur, circuit judge; and the honorable John H. McNary, district judge.

This cause came on to be heard at the November term of said court and was argued by counsel, and upon consideration of the evidence and the record in said cause it appears that the material facts are as follows:

1. May 24, 1927, the Public Service Commission of the State of Oregon filed its complaint with the Interstate Commerce Commission against the Oregon-Washington Railroad & Navigation Company, the Union Pacific Railroad Company, and a number of other railroads, alleging that the carriers named as parties to the proceeding had failed and refused to provide reasonable and adequate facilities of transportation by railroad to a large area within the State of Oregon; that such facilities were reasonably required in the interest of public convenience and necessity; that the expense of providing

198a such facilities will not impair the ability of the carriers to perform their duty to the public, and praying for an order requiring some one or more of such carriers to construct a line of railroad between Crane, Oregon, on the east, and Crescent Lake, or some adjacent point on the line of the Southern Pacific Company, on

the west. After full investigation and hearing the Interstate Commerce Commission made its order requiring the Oregon-Washington Railroad & Navigation Company to extend its line of railroad, now terminating at, or near, Burns, Oregon, to a connection with the Cascade line of the Southern Pacific Company, at, or near, Crescent Lake, Oregon, and that the Union Pacific Railroad Company be, and it was thereby, authorized to join in the construction and operation of such extension and to finance it from current funds or by advances. In making said order the Interstate Commerce Commission relied for its authority upon section 1, paragraph 21 of the interstate commerce act.

2. The Union Pacific Railroad Company owns all of the capital stock of the Oregon Short Line Railroad Company and the Oregon Short Line owns all but fifteen shares of the capital stock of the Oregon-Washington Railroad & Navigation Company. The present line of the Oregon-Washington Railroad & Navigation Company extends from Portland, Oregon, to Huntington, Oregon, where it connects with the Oregon Short Line. The line of the Oregon Short Line extends from Huntington, Oregon, to Ogden, Utah, where it connects with the line of the Union Pacific Company, which extends from Ogden to Omaha, Nebraska. These three lines, together with the line of the Los Angeles & Salt Lake Railroad Company, extending from Salt Lake City, Utah, to Los Angeles, California, make up the Union Pacific system.

3. In 1916 the Oregon-Washington Company completed a branch line from a main line connection at Ontario, Oregon, to Crane, Oregon, a distance of approximately 127 miles, which has since been operated by the Oregon Short Line under a lease. In 1924 the line in question was further extended to Burns, Oregon, a distance of about 30 miles. The extension now ordered is 185 miles in
199a length; and the estimated cost of constructing it is from nine to eleven million dollars.

4. The record made before the Interstate Commerce Commission shows that if the petitioner, Oregon-Washington Railroad & Navigation Company, is to be considered as a separate entity apart from the corporations comprising the Union Pacific system, the cost and expense of constructing said extension will impair its ability to perform its duty to the public, but that if the financial ability of the Union Pacific system in its entirety is considered the cost and expense of constructing said extension will not materially impair the ability of the system to perform its duty to the public.

5. The proposed line in large part would extend through a sparsely settled desert waste which the petitioner has not undertaken or professed to serve. One of the dominant purposes of the order complained of was to provide for the construction of a new east and west line of railroad, whereby lumber traffic originating hundreds of miles from petitioner's present line may find a shorter route to eastern markets, and traffic from southwestern Idaho may find a shorter route to northern California points.

And upon consideration of the questions of law presented for determination the court concludes:

(a) The provision in section 1, paragraph 21, of the interstate commerce act with respect to the compulsory extension of the line or lines of carriers by railroad, if construed broadly and liberally as was done by the Interstate Commerce Commission in making the order complained of in this case, would be in violation of the fifth amendment to the Constitution of the United States and void.

(b) Said provision in paragraph 21 of section 1 of the interstate commerce act should be so construed as to limit the application of same by the Interstate Commerce Commission to such extension of the line or lines of a carrier by railroad as are reasonably necessary to enable such carrier to serve adequately the communities and industries in the territory which it has occupied and professed to serve.

(c) The Interstate Commerce Commission, in entering
200a the order complained of, exceeded its authority under the laws and Constitution of the United States, and said order is unlawful and void.

Dated this 29th day of January, 1931.

FRANK H. RUDKIN,
Circuit Judge.
CURTIS D. WILBUR,
Circuit Judge.
JOHN H. MCNARY,
District Judge.

In equity, No. E–9113

OREGON-WASHINGTON RAILROAD & NAVIGATION COMPANY, PETITIONER

vs.

THE UNITED STATES OF AMERICA, DEFENDANT; SOUTHERN PACIFIC Company, Great Northern Railway Company, Public Service Commission of Oregon, Public Utilities Commission of Idaho, and Interstate Commerce Commission, interveners

Decree

Filed Jan. 29, 1931

At the November term of the District Court of the United States for the District of Oregon held at the United States court room in the city of Portland, Oregon, on the 22d day of January, 1931.

Present: The honorable Frank H. Rudkin, Circuit Judge; the honorable Curtis D. Wilbur, Circuit Judge; and the honorable John H. McNary, District Judge.

This cause came on to be heard at the November term of said court and was argued by counsel; and thereafter said court so constituted made and rendered its findings of fact and conclusions of law in said cause, and said findings and conclusions so made having been entered of record herein, now upon consideration thereof and of the evidence and record in said cause, it appearing that on the 3d day of December, A. D. 1929, the Interstate Commerce Commission made and rendered its order in a cause then and there pending before said Interstate Commerce Commission wherein the Public Service Commission of Oregon was complainant and Central Pacific Railway Company, Oregon-Washington Railroad & Navigation Company (petitioner herein), and others were defendants, said cause bearing docket number of said commission No. 19680, by the terms and provisions of which said order said Oregon-Washington Railroad &
Navigation Company, the petitioner herein, was ordered and
203a required to extend its line of railroad now terminating at or
nears Burns, Oregon, from or near a station thereon designated as Crane, Oregon, to a connection with the Cascade line of the Southern Pacific Company at or near Crescent Lake, Oregon, and was further required to commence the construction of said line of railroad or or before July 1, 1930, and to complete and place the same in operation before July 1, 1933; and that on the 19th day of June, 1930, said Interstate Commerce Commission entered its order in said cause, docket No. 19680, modifying its said order of December 3, 1929, by postponing said date on or before which construction must be commenced to January 1, 1931, but in no other respect, and that on the 20th day of December, 1930, said Interstate Commerce Commission again modified its said order in said cause 19680 by further postponing said date on or before which said construction must be commenced to April 1, 1931, but in no other respect.

And it appearing to the court that the order of said Interstate Commerce Commission of date December 3d, A. D. 1929, so modified as aforesaid, was and is unlawful and void and that the enforcement thereof would cause the petitioner herein irreparable injury and damage, and that petitioner has no adequate remedy at law in the premises.

Now, therefore, it was and is ordered, adjudged, and decreed that said order of said Interstate Commerce Commission of date December 3d, A. D. 1929, so modified as aforesaid, be and the same is hereby set aside and annulled, and that the defendant, its officers and agents, be and they are hereby perpetually enjoined from enforcing or attempting to enforce said order as so modified, and that said defendant and its officers and agents be and they are hereby perpetually enjoined from instituting or prosecuting any proceeding to recover any penalty or penalties from the petitioner by reason of

its refusal or neglect to comply with said order of the Interstate Commerce Commission, so modified as aforesaid.

204a Dated, January 29, 1931.

FRANK H. RUDKIN,
Circuit Judge.
CURTIS D. WILBUR,
Circuit Judge.
JOHN H. MCNARY,
District Judge.

Petition for appeal by Interstate Commerce Commission, public utilities commissioner of Oregon (successor of Public Service Commission of Oregon), and Public Utilities Commission of the State of Idaho

(Filed March 18, 1931)

Interstate Commerce Commission, public utilities commissioner of Oregon (successor of Public Service Commission of Oregon), and Public Utilities Commission of the State of Idaho, intervening defendants, feeling themselves aggrieved by the final decree of the United States District Court for the District of Oregon entered January 29, 1931, in the above-entitled cause, pray an appeal therefrom to the Supreme Court of the United States.

The particulars wherein they consider the final order or decree erroneous are set forth in the assignment of errors filed herewith and to which reference is hereby made.

They pray that a transcript of the record, proceedings, and papers on which the final decree was made and entered, duly authenticated, may be transmitted forthwith to the Supreme Court of the United States.

207a DANIEL W. KNOWLTON,
J. STANLEY PAYNE,
Solicitors for Interstate Commerce Commission.
I. H. VAN WINKLE,
Solicitor for Public Utilities Commissioner of Oregon (Successor of Public Service Commission of Oregon).
J. M. THOMPSON,
Solicitor for Public Utilities Commission of the State of Idaho.

[Title omitted.]

Assignment of errors

Filed March 18, 1931

Interstate Commerce Commission, public utilities commissioner of Oregon (successor of Public Service Commission of Oregon), and Public Utilities Commission of the State of Idaho, intervening defendants, now come by their respective counsel, and in connection with their petition for appeal, file the following assignment of errors upon which they will rely on their appeal to the Supreme Court of the United States from the final decree of the District Court entered January 29, 1931.

The District Court erred:

1. In setting aside, annulling, and permanently enjoining the commission's order of December 3, 1929.

2. In holding that the order in question exceeds the authority of the commission and is void.

3. In holding that the extension provision of the transportation act (section 1 (21) of the interstate commerce act) is "limited to such extensions as are reasonably necessary to reach communities and industries in the territory which the carrier has professed to serve or according to the undertaking which it has expressly or impliedly assumed."

210a

4. In holding that because "one of the dominant purposes of the order complained of was to require the petitioner to construct a line of railroad 185 miles in length in order that lumber traffic originating perhaps hundreds of miles from its present lines might find a shorter route to eastern markets, and that traffic from southwestern Idaho might find a shorter route to northern California points," the carrier "was plainly required to devote its property to a service which it has never professed to render and to a service entirely beyond the scope of the undertaking which it has expressly or impliedly assumed."

5. In holding that section 1 (21) of the interstate commerce act "is susceptible to two constructions, by one of which grave and doubtful constitutional questions arise and by the other of which such questions are avoided."

6. In holding that the commission misconstrued section 1 (21) of the interstate commerce act.

7. In holding that "the provision of the transportation act of 1920 authorizing the Interstate Commerce Commission to require carriers to extend their line or lines (section 1 (21) of the interstate

commerce act) is unconstitutional and void if it must be construed broadly and liberally, as was done by the commission in the present case."

8. In holding that the construction placed by the commission on section 1 (21) of the interstate commerce act is neither necessary nor permissible.

9. In not dismissing the petition.

Wherefore, said intervening defendants pray that said final decree of January 29, 1931, be reversed and set aside in the particulars above enumerated, and that said order of the Interstate Commerce Commission dated December 3, 1929, be found and adjudged to be valid and lawful in all respects.

311a

UNITED STATES OF AMERICA, DEFENDANT, AND INTERSTATE COMMERCE Commission, Public Utilities Commissioner of Oregon (successor of Public Service Commission of Oregon), and Public Utilities Commission of the State of Idaho, intervening defendants

Order allowing appeal

Filed March 18, 1931

In the above-entitled cause, Interstate Commerce Commission, public utilities commissioner of Oregon (successor of Public Service Commission of Oregon), and Public Utilities Commission of Idaho, intervening defendants, having made and filed their petition praying an appeal to the Supreme Court of the United States from the final decree of this court entered January 29, 1931, and having also made and filed an assignment of errors, and having in all respects conformed to the statutes and rules of court in such case made and provided:

It is ordered and decreed that the appeal be, and the same is hereby, allowed as prayed and made returnable within thirty (30) days from the date hereof, and the clerk is directed to transmit forthwith a properly authenticated transcript of the record, proceedings, and papers on which the decree was made and entered.

Dated March 18th, 1931.

Summons and severance

Filed March 18, 1931

To the United States of America:

You are hereby invited to join with the Interstate Commerce Commission, the public utilities commissioner of Oregon (successor of the Public Service Commission of Oregon), and the Public Utilities Commission of the State of Idaho, intervening defendants, in an appeal to the Supreme Court of the United States which they will seasonably prosecute from the final decree of the district court entered January 29, 1931, setting aside, annulling, and enjoining the enforcement of the order of the Interstate Commerce Commission in the proceeding entitled Public Service Commission of Oregon v. Central Pacific Ry Co. et al., docket No. 19680, in the above-entitled cause, in which you are defendant.

In the event of your failure to join, Interstate Commerce Commission, public utilities commissioner of Oregon (successor of Public Service Commission of Oregon), and Public Utilities Commission of

the State of Idaho will prosecute the appeal for the reversal of said final decree of the district court without joining you.

March 12, 1931.

Stipulation re statement of evidence

Filed Feb. 6, 1932

It is hereby stipulated by the parties, including the interveners, acting by their respective counsel, for the purpose of settling the record for the appeal to the Supreme Court of the United States, that:

1. The within and foregoing statement of evidence is a true and correct statement in narrative form of all the oral testimony introduced before the Interstate Commerce Commission in the proceeding styled Oregon Public Service Commission v. Central Pacific Railway Company et al., docket No. 19680, as the same is contained in the official typewritten transcript thereof on file with the Interstate Commerce Commission, a copy of which, duly certified by said Commission, was offered in evidence by the petitioner in the District Court in the above-entitled case as Exhibit No. 2; and said oral testimony, together with the documentary exhibits referred to therein which were offered and received in evidence before the Interstate Commerce Commission in the above-entitled proceeding, copies of which, duly certified by said commission, were introduced in evidence by the petitioner in the District Court in the above-entitled case collectively as Exhibit No. 3, constituted all the evidence introduced before the Interstate Commerce Commission in the aforesaid proceeding; and said Exhibits Nos. 2 and 3, together

219a with Exhibits 1, 4, 5, 6, 7, 8, and 9, introduced by petitioner, and Exhibits A, B, C, D, and E, introduced by defendants, constituted all the evidence submitted at the hearings before the District Court in the above-entitled case.

2. That the said statement in narrative form of the oral testimony introduced before the Interstate Commerce Commission in the above-entitled proceeding shall be substituted for the certified copy of the original testimony of the witnesses and shall have the same force and effect upon appeal as the original testimony.

3. Petitioner's Exhibits 1, 3, 4, 5, 6, 7, 8, and 9 and defendants' Exhibits A, B, C, D, and E shall stand as original exhibits and shall be transmitted on appeal instead of transcripts thereof; and the aforesaid statement in narrative form of the testimony before the Interstate Commerce Commission, together with this stipulation and the order of the court pursuant thereto, shall likewise be so transmitted.

J. STANLEY PAYNE,
Solicitor for Interstate Commerce Commission.
I. H. VAN WINKLE,
Solicitor for Public Utilities Commission of Oregon
(Successor of Public Service Commission of Oregon)

Order approving statement of evidence, etc.

Filed February 8, 1932

It appearing that a condensed statement in narrative form of the evidence taken before the Interstate Commerce Commission has been prepared from petitioner's Exhibit No. 2 introduced in evidence in

this court upon the trial of this cause, and that said statement has been lodged with the clerk of this court, and that by stipulation entitled "Stipulation re statement of evidence," filed in this court on the 6th day of February, 1932, the parties to said stipulation have approved said condensed statement of evidence and agreed that same may be substituted for said petitioner's Exhibit 2 on the appeal of this cause to the Supreme Court of the United States;

And it further appearing, in the opinion of the presiding judge of this court, that it will be necessary and proper that the following original papers introduced in evidence in this court upon the trial of this cause, to wit, petitioner's Exhibits 1 and 3 to 9, inclusive, and defendants' Exhibits A, B, C, D, and E, be inspected in the Supreme Court of the United States upon the appeal thereof;

It is therefore ordered that said condensed statement in narrative form so prepared from petitioner's Exhibit 2 be and the same is hereby approved and substituted for said petitioner's Exhibit 2 and made a part of the record on appeal in this cause, and the original thereof shall be transmitted by the clerk of this court
222a to the clerk of the Supreme Court of the United States instead of a transcript thereof.

It is further ordered that petitioner's Exhibits 1, 3, 4, 5, 6, 7, 8, and 9 and defendants' Exhibits A, B, C, D, and E, and each and all thereof be, and the same are hereby made a part of the record in this cause upon appeal thereof to the Supreme Court of the United States and said original exhibits shall be transmitted by the clerk of this court to the clerk of the Supreme Court of the United States along with the transcript herein, for the consideration of the Supreme Court as a part of the record on appeal herein.

The aforesaid exhibits, namely, petitioner's Exhibits 1 to 9, inclusive, and defendants' Exhibits A, B, C, D, and E, contain all the evidence submitted to this court on the hearings of this cause.

Dated, this 8th day of February, 1932.

Præcipe for transcript of record

Filed Jan. 25, 1932

To the CLERK:

Please prepare a transcript of the record in the above-entitled cause in the matter of the appeal therein, and include in said transcript, in the order given below, the following matter, viz:

1. Petition.

2. Proof of service of petition upon the Interstate Commerce Commission, viz, notice of service and acknowledgment thereof.

3. Proof of service of petition upon the Attorney General of the United States, viz, notice of service and acknowledgment thereof.

4. Order entered June 27, 1930, allowing defendant to August 1, 1930, to file answer.

5. Stipulation dated June 26, 1930, agreeing to amendment of petition by interlineation, and order entered July 10, 1930, allowing amendment.

6. Supplemental petition filed July 10, 1930.

7. Second supplemental petition.

8. Petition of Southern Pacific Company for leave to intervene and order granting said petition.

9. Petition of Public Service Commission of Oregon and Public Utilities Commission of the State of Idaho for leave to intervene and order granting said petition.

225a 10. Intervention of Interstate Commerce Commission.

11. Petition of Great Northern Railway, Oregon Trunk Railway, and Oregon Electric Railway Company for leave to intervene, and order granting said petition.

12. Answer of United States of America.

13. Answer of Interstate Commerce Commission.

14. Answer of Public Service Commission of Oregon and Public Utilities Commission of the State of Idaho.

15. Answer of Public Service Commission of Oregon and Public Utilities Commission of the State of Idaho to petition of Southern Pacific Company for leave to intervene.

16. Opinion of the court by Circuit Judge Rudkin.

17. Court's finding of facts and conclusions of law.

18. Final decree.

19. Petition for appeal.

20. Citations on appeal.

21. Assignment of errors.

22. Order allowing appeal.

23. Summons and severance to the United States of America.

24. Statement of the evidence in condensed, narrative form, agreed to by the parties and approved by order of the court. (NOTE.—The original of this statement of the evidence, instead of a transcript thereof, is to be transmitted to the clerk of the Supreme Court, under order of the District Court.)

25. Stipulation re statement of evidence.

26. Order of the District Court approving statement of the evidence in condensed, narrative form, and containing directions in respect of transmitting exhibits and statement of evidence in original form.

27. Petitioner's Exhibits 1, 3, 4, 5, 6, 7, 8, and 9 and defendants' Exhibits A, B, C, D, and E. (NOTE.—The originals of these exhibits, instead of transcripts thereof, are to be transmitted to the clerk of the Supreme Court, under order of the District Court.)

28. This præcipe.

Clerk's certificate

I, G. H. Marsh, clerk of the District Court of the United States for the District of Oregon, do hereby certify that the foregoing pages, numbered from 6a to 229a, inclusive, constitute the transcript of record upon the appeal in a cause in said court, numbered upon its records E–9113, in which the Oregon-Washington Railroad & Navigation Company is petitioner, the United States of America is defendant; the Southern Pacific Company, the Great Northern Railway Company, the Oregon Trunk Railway, and the Oregon Electric Railway Company are intervening plaintiffs, and the Interstate Commerce Commission, the Public Service Commission of Oregon, and the Public Utilities Commission of the State of Idaho are intervening defendants; in which cause the said intervening defendants, the Interstate Commerce Commission, the public utilities commissioner of Oregon (successor to the Public Service Commission of Oregon), and the Public Utilities Commission of the State of Idaho are appellants, and the petitioner, Oregon-Washington Railroad & Navigation Company, the intervening plaintiffs, Southern Pacific Company, Great Northern Railway Company, Oregon Trunk Railway, and Oregon Electric Railway Company are appellees; that the said transcript has been prepared by me in accordance with the præcipe for transcript filed by said appellants, and is a full, true, and complete transcript of the record and proceedings had in said court in said cause, in accordance with the said præcipe, as the same appear of record and on file at my office and in my custody.

I further certify that the original citation to the Oregon-Washington Railroad & Navigation Company, the Southern Pacific Company, and the Great Northern Railway Company, and the original citation to the Oregon Trunk Railway, and the Oregon Electric Railway Company are attached to the foregoing transcript and are returned to the Supreme Court of the United States with the said transcript annexed.

I further certify that pursuant to order of the said District Court of the United States for the District of Oregon there is transmitted to the Supreme Court of the United States with the said transcript of record and as a part thereof the original statement of the evidence and original exhibits, as follows: Petitioners' Exhibits 1, 3, 4, 5, 6, 7, 8, and 9, and defendants' Exhibits A, B, C, D, and E.

I further certify that the cost of the following transcript is $60.85, and that the same has been charged as constructive earnings from the United States.

In testimony whereof I have hereunto set my hand and affixed the seal of said court, at Portland, in said district, this 10th day of March, 1932.

[SEAL.]

G. H. MARSH, *Clerk.*

[File endorsement omitted.]

231a In United States District Court for the District of Oregon

In equity, No. E–9113

OREGON-WASHINGTON RAILROAD & NAVIGATION COMPANY, PETITIONER

v.

UNITED STATES OF AMERICA, DEFENDANT, AND INTERSTATE COMMERCE Commission, Public Utilities Commissioner of Oregon (successor of Public Service Commission of Oregon), and Public Utilities Commission of the State of Idaho, intervening defendants

Statement of the evidence

Filed Feb. 8, 1932

This cause came on for hearing on September 29, 1930, before the late Circuit Judge Dietrich, the late Circuit Judge Bean, and District Judge McNary. Owing to the death of Circuit Judge Dietrich the cause was reheard December 9, 1930, by Circuit Judge Rudkin, the late District Judge Bean, and District Judge McNary. Owing to the death of District Judge Bean the cause was again heard January 22, 1931, by Circuit Judges Rudkin and Wilbur and District Judge McNary. At all three hearings the petitioner was represented by its solicitors, Arthur C. Spencer and Roy F. Shields; the United States, by George Neuner, United States Attorney for the District of Oregon; the Interstate Commerce Commission, by J. Stanley Payne, its assistant chief counsel; the Public Service Commission of Oregon, by William C. McCulloch and William P. Ellis; the Public Utilities Commission of Idaho, by J. M. Thompson; the Southern Pacific Company, by Alfred A. Hampson; the Great Northern Railway, the Oregon Trunk Railway, and the Oregon Electric Railway Company, by Charles A. Hart.

232a *Offers in evidence*

There were offered and received in evidence petitioner's Exhibits 1 to 9, inclusive, and defendants' Exhibits A, B, C, D, and E, which were as follows:

Exhibit No. 1. Stipulation regarding introduction in evidence before the district court of certified copies of documents on file with Interstate Commerce Commisson.

Exhbit No. 2. Certified copy of transcript of the testimony introduced before the Interstate Commerce Commission in the proceeding styled docket No. 19680, Oregon Public Service Commission v. Central Pacific Railway Company et al.

Exhibit No. 3. Certified copy of the exhibits received in evidence before the Interstate Commerce Commission in said docket No. 19680.

Exhibit No. 4. Certified copy of complaint filed May 4, 1927, with Interstate Commerce Commission, by Public Service Commission of Oregon, and joint answer of Des Chutes Railroad Company, Oregon Short Line Railroad Company, Oregon-Washington Railroad & Navigation Company, and Union Pacific Railroad Company to said complaint, in docket No. 19680, Oregon Public Service Com. v. Central Pacific Ry Co. et al.

Exhibit No. 5. Certified copies of joint answer of Spokane, Portland & Seattle Railway Company, Oregon Trunk Railway, and Oregon Electric Railway Company, of answer of Great Northern Railway Company, of joint answer of Central Pacific Railway Company and Southern Pacific Company, and of answer of Northern Pacific Railway Company in said docket No. 19680.

Exhibit No. 6. Certified copy of brief submitted to Interstate Commerce Commission by complainant in said docket No. 19680.

233a Exhibit No. 7. Certified copy of report and order of Interstate Commerce Commission, entered December 3, 1930, in said docket No. 19680.

Exhibit No. 8. Report of Interstate Commerce Commission in construction of lines in eastern Oregon.

Exhibit No. 9. Certified copy of brief submitted to Interstate Commerce Commission by complainant in No. 14392, Public Service Commission of Oregon v. Central Pacific Railway Company.

Exhibit A. Articles incorporation Oregon-Washington Railroad & Navigation Company.

Exhibit B. Supplemental articles incorporation Oregon-Washington Railroad & Navigation Company.

Exhibit C. Resolution board of directors Oregon-Washington Railroad & Navigation Company, line Crane to Burns.

Exhibit D. Reply of Public Service Commission of Oregon.

Exhibit E. Certified copy page 3 carriers' protest.

The following is a condensed statement in narrative form of the testimony introduced before the Interstate Commerce Commission in said docket No. 19860:

1 *Narrative of the evidence before the Interstate Commerce Commission*

PORTLAND, OREGON, *August 2, 1928—10.00 o'clock a. m.*

Before Hon. FRANK MCMANAMY, Commissioner; Mr. JOHN L. ROGERS, Examiner

(Pursuant to notice)

Colloquy

Comr. MCMANAMY. The Interstate Commerce Commission has assigned for hearing at this time and place docket No. 19680, this being

the case of the Public Service Commission of Oregon against the Central Pacific Railway Company, the Des Chutes Railroad Company, the Great Northern Railroad Company, Northern Pacific Railway Company, Oregon Electric Railway Company, Oregon Short Line Railroad Company, Oregon Trunk Railway, Oregon-Washington Railroad & Navigation Company, Southern Pacific Company, Spokane, Portland & Seattle Railway Company, and Union Pacific Railroad Company.

Petitions for intervention have been granted on behalf of the Public Utilities Commission of Idaho, Grants Pass Chamber of Commerce, Ontario Commercial Club, Douglas County, Oregon, Roseburg, Oregon Chamber of Commerce, Coos County Chamber of Commerce, Portland Chamber of Commerce of Portland, Oregon; Lane County Court, Springfield Chamber of Commerce, Eugene Chamber of Commerce, Portland Traffic & Transportation Association, Grant County, Oregon, Burns Chamber of Commerce, Harney County, Oregon, Albany Chamber of Commerce, County Court of Malheur County, Oregon, Willamette Valley Lumbermen's Association.

2 The complaint in this case alleges, in substance, that defendants have failed and refused, and still fail and refuse, to provide a large area within the State of Oregon with (5) adequate and reasonable facilities of transportation by railroad, and that such facilities are demanded by public interest, convenience and necessity, and that the expense involved in furnishing such facilities will not impair the ability of defendants, or any of them, to perform their duty to the public.

It is alleged that by reason of the alleged facts defendants unlawfully, in violation of sections 1, 15, and 15–A of the interstate commerce act, have failed and refused, and still fail and refuse, to give due consideration to the transportation needs of the State of Oregon and to the necessity under honest, efficient, and economical management of enlarging their existing transportation facilities in order to provide the people of the State of Oregon with adequate transportation, and to that end extend their lines and to operate the same substantially as demanded in the complaint.

The commission is asked to issue an order commanding the defendants to cease and desist from these alleged violations of the act, and requiring some one or more of them to extend and construct a line of railroad between Crane or Harriman, Oregon, on the east, and Crescent Lake or some adjacent point on the line of the Southern Pacific Company on the west, and commanding defendants to establish and maintain just and reasonable through routes and joint rates with such (6) extensions, and just and reasonable divisions of such joint rates, and just and reasonable terms and conditions under which such through routes shall be operated, and such common use of extensions as may be reasonable and neces-

3

sary, and that such other details and further orders or requirements be made as the comimssion may consider proper in the premises.

Is that a substantial statement of the issues?

Mr. ELLIS. It is, Mr. Commissioner.

Comr. MCMANAMY. Are there other petitions for intervention to be filed?

Mr. DEARMOND. H. H. DeArmond; if the commissioner please, I desire to file, on behalf of the city of Bend and the Bend Chamber of Commerce. Shall I make service on the other interveners?

Exam. ROGERS. All parties.

Comr. MCMANAMY. All parties to the case should receive petitions of intervention.

Are there other petitions for intervention?

Mr. BECHTELL. If the commissioner please, L. M. Bechtell, on behalf of the city of Prineville, Oregon, Crook County, and the Prineville Businessmen's Club of Prineville, Oregon, petition of intervention.

Comr. MCMANAMY. Any other intervening petitions? Without objections, these petitions will be granted. (7.)

(Said petition in intervention of city of Prineville, Crook County, Oregon, and Prineville Businessmen's Club, and said petitions in intervention of the city of Bend and Bend Chamber of Commerce were thereupon received.)

4 Comr. MCMANAMY. Who appears for the complainants?

Mr. ELLIS. William P. Ellis and William C. McCulloch.

Comr. MCMANAMY. Who appears for the defendants?

Mr. DEY. Ben C. Dey, for the Central Pacific Railway Company and Southern Pacific Company.

Mr. SPENCER. A. C. Spencer, for the Oregon-Washington Railroad & Navigation Company, The Des Chutes Railroad Company, Oregon Short Line Railroad Company, and Union Pacific Railroad Company.

Mr. PICKARD. Charles A. Hart, for the Spokane, Portland & Seattle Railroad Company, the Oregon Trunk Railway, Oregon Electric Railway Company, Great Northern Railway Company, and Northern Pacific Railway Company.

Comr. MCMANAMY. Who appears for the interveners?

Mr. DUNCAN. Robert M. Duncan, appearing for Harney County, Grant County, Malheur County, Ontario Commercial Club, and Burns Commercial Club.

Mr. THOMPSON. J. M. Thompson and Samuel L. Newton, for (8) the Idaho Public Utilities Commission, interveners.

Comr. MCMANAMY. Are there other appearances?

Mr. CHINNOCK. For the Grants Pass Chamber of Commerce, James T. Chinnock, and J. R. Harvey.

Mr. MCCULLOCH. William C. McCulloch, for the Portland Traffic & Transportation Association, and Mr. Ellis and I also appear for

the Willamette Valley Lumbermen's Association and various other interveners for whom written appearances have been entered. (9.)

H. H. COREY was thereupon produced as a witness on behalf of complainants, and, having been first duly sworn, testified as follows:

Direct examination:

I am a member of the Public Service Commission of Oregon and have so served for about 12 years. Prior to that time I was secretary of the commission for four years. (10.) I have resided within the State of Oregon since 1886. In my capacity as a member of the public service commission I believe I have become to a considerable extent familiar with the transportation system of the State and with the physical and commercial conditions of the State. It is clearly the duty of the public service commission under the statute to concern itself with the transportation needs of the State, and, where found necessary, to present such matters to the Interstate Commerce Commission.

I am familiar with the history of the railroad proceeding a part of which is now before the commission for consideration. I will state the facts and circumstances that brought about the inauguration of the original proceeding of which the present proceeding is an outgrowth.

Formerly the Union Pacific and Southern Pacific were under one management, one control. These by decree of the Supreme Court of the United States were divorced as being contrary to the Sherman anti-trust law. At that time (11) there was a considerable campaign on within the State of Oregon on the part of both the Southern Pacific and the Union Pacific to secure control of the Central Pacific. At that time the Public Service Commission of Oregon conceived the idea of filing a complaint with the Interstate Commerce Commission under the 1920 transportation act seeking joint construction of the uncompleted portion of the Central Pacific between Kirk and Oakridge, that the several defendants be made to construct this particular portion of the Central Pacific jointly, and that it be operated jointly by the various railroads. This would assist us in securing more adequate rail transportation within the State of Oregon. At the time that complaint was filed there was no such line of railroad between Kirk and Oakridge, now known as the Natron cut-off, nor was the line completed to Bend—constructed to Burns, Oregon, from Crane, nor was the line completed from Bend to Klamath Falls. All of these were included in the complaint of the public service commission before the Interstate Commerce Commission. This program has been since quite generally carried out upon application by the carriers themselves to the Interstate Commerce Commission for authority to construct the several lines. There remains yet to be completed the line due east and west between Crane, or, rather, a point four and one-half miles west of Crane,

called Harriman, to connect with the Natron cut-off, also a line (12) reaching into Lake View from the north.

Since this complaint, original complaint, was filed, in October, 1922, the narrow gauge line from Lake View south has been standardized, is now a standard gauge line, or practically.

Approximately 181 miles of construction will be necessitated to complete the original project that the commission originally suggested. In a general way this route follows the original survey—the old Harriman survey—made many years ago, and which was partially completed, approximately 130 miles west from Ontario to Crane. This was never completed, owing to the separation of the Union Pacific and Central Pacific, Southern Pacific Company.

I can describe, in a general way, the suggested points of connection with the rail lines on the east and west ends, and, in a general way, the character of country proposed to be traversed. The line now sought to be constructed is practically due east and west, extending west from Crane to a connecting point with the Natron
7 cut-off near Crescent Lake. This is across the high plateau, known sometimes as the desert. This cover an area of perhaps 75 miles square, and it practically a desert. To the north of this, however, are vast stands of (13) timber. We have north of Burns, variously estimated, from seven to ten billion feet of timber, one hundred five billion feet in the vicinity of Bend, between seven and fourteen billion feet of timber north of Lake View to the south of this area described, with hundreds of—two or three hundred billion feet of timber to the west, that is, including the Cascades and the Willamette Valley. In this high plateau, however, there is potential tonnage from the minerals in the Lakes in that locality.

There are also vast areas in Harney County that can be suitable for growing of agricultural products, and grain has been known to be grown to perfection in that locality.

The present route from Harney Valley would be made east over the—Oregon-Washington Railroad & Navigation Company line through Ontario, which is operated by the Oregon-Short Line, I believe, thence north via Huntington to Portland, a very roundabout circuitous route. A line due east and west would shorten this distance immensely, and also allow that district, as well as all western Idaho, access to the Pacific ports by the shortest routes possible. (14.)

Q. What are the particular necessities of the Malheur and Harney sections, as you found them, for rail transportation? That is, what are their real needs?

A. All that territory should be brought in closer contact with the metropolis of Portland and the capitol at Salem. They are rather isolated at this time. There is a vast area in there, something approximately 33,000 square miles which is all at present served only to a small extent by branch lines around the border.

8 Q. What are the essential physical characteristics of the State of Oregon east of the Cascades and west of the Cascades, and what effect does that have on the necessity for interchange of commodities between the east and west sides of the State?

A. The east side is a more arid district, irrigation projects, vast quantities of alfalfa hay is grown and can be grown, while the western part of the State is more of a dairying and farming district. There is need of interchange by the shortest route possible of commodities such as hay and grain for feeding the dairying industries of the coast, while the coast requires a much shorter route for its tonnage eastbound.

Under the existing transportation system the commerce and the general relationships between the east and west sides of the State are hampered by reason of the Cascade Mountains, which extends the full length of the State, and difficulty of (15) construction, of communication by means of railroads or wagon roads over the Cascades. In my judgment, that has to an appreciable extent retarded the natural development of the State of Oregon, to the extent that we have probably the largest area in the United States without any adequate rail transportation. As to what extent the western section of the State of Oregon has suffered by reason of the existing transportation facilities, or lack of facilities, during the past years: Oregon has, in fact, more than one-half of the standing merchantable timber in the United States. The largest portion of this lies west of the Cascade Mountains, and the larger portion of it is south and west from Eugene. This tonnage to-day must move north to Portland, thence east via the Union Pacific, Great Northern, Northern Pacific, or Milwaukee, or south, as the bulk of it does move, as far south as Roseville, California, before this lumber actually starts on its eastern journey. In reaching Roseville it passes the Cascade Range twice at considerable elevation.

9 A route directly east will avoid this and make a much shorter route by connection with the Natron cut-off at Crescent Lake—shorten the distance over the Roseville route (16) some 420 miles to all points east of Granger, Wyoming.

Q. To what extent has this condition of circuitous haul affected the development of the lumber industry in western Oregon?

A. Well, notwithstanding the large timber area we possess we have relatively small production, no large mills established on any single-line railroad. The large mills are always established where there is more than one railroad to serve the industry, such as at Bend, or on tidewater where they have both rail and boat transportation.

I do not believe there are any large sawmills in western Oregon at the present time operating at points served exclusively by the Southern Pacific Company. The large mills located in western Oregon at the present time are at Portland, Coos Bay, and I believe

there is a large mill at Wheeler. There is also a large mill at Springfield.

As to what extent western Oregon has during the past years (17) suffered from car shortage, car shortage was general for many years up until the construction of the Natron cut-off. It was an annual event.

Q. Over how long a period of time would you say this general car-shortage situation existed, to your knowledge?

A. General car shortage was one of the prime reasons for the adoption by the legislature of the transportation act of this State along in 1907, but there had been car shortage prior to that time, and a car shortage annually, practically annually, sometimes to a considerable number, sometimes as high as 2,000, the records of the public service commission will show; that was annual up until the last few years, since which time we have not been confronted with car shortages.

10 I can state what fundamental transportation conditions contributed largely to that car shortage. Oregon being situated to the extreme western terminals of the various lines of railroad, all western Oregon being served, practically everything west and south of Portland and Astoria, by the Southern Pacific, the Southern Pacific has found difficulty in supplying empty cars, inasmuch as they had to be transported over the Siskiyou Mountains. California, producing many of the same commodities as Oregon, usually had first opportunity at the empty cars.

In Central Oregon there are large lumber mills (18) at Bend and Klamath Falls. Both of those points are competitive points. Bend is served by the Union Pacific and the so-called Hill lines, that is, the Great Northern and Northern Pacific. Klamath Falls is served by the Great Northern and the Southern Pacific. The city of Portland is served by the Southern Pacific, the Union Pacific, the Great Northern, and the Northern Pacific.

My investigation of this matter disclosed that there was urgent public need for additional rail transportation facilities. Concerning the location of the proposed route with reference to port facilities on the Pacific coast, the proposed route will shorten the distance from all western Idaho and central and eastern Oregon to all coast points. A direct line east and west would, if continued to the coast, afford terminal rates to the coast ports the same as Portland and Astoria now receive. That would not be true if the extension terminated near Crescent Lake, that would involve a two-line haul. (19.)

I am somewhat familiar with what agricultural development is taking place in Malheur County at the present time. I know of irrigation projects being put in there by the Government. The irrigation projects recently authorized by the Federal Government and now being financed to many millions of dollars to

11 bring (20) more of Malheur County under irrigation. That

is the Owyhee project and the Warm Springs project. I don't know what the total cost will be to the Reclamation Service of those projects. It runs up into many millions. I understand it is approximately twenty-three million dollars, the Government's estimate, With these projects going in in Malheur County, their natural markets lie on the Pacific coast. The cross-State line that we are asking for will have the effect in the development of that area of shortening the distance materially. (21.)

Cross-examination:

In my description of the railroad routes now available from western Oregon I mentioned the route through Portland, to the north, and through Roseville, California, toward the south. I am aware that the Central Pacific Railway Company, allied with the Southern Pacific Company, is building a new line, a new route, from Klamath Falls east through Alturas, California, to a connection with the Central Pacific in Nevada. And that some large investment has already been made over that route through the standardizing of the Nevada-California-Oregon line, and toward the construction of the remaining mileage between Klamath Falls and Alturas. That will improve the situation, in my opinion. As to whether that would be a very substantial improvement in the situation against which we complain: It will avoid the haul from Klamath over the Cascade Mountains into California and to Roseville, and this line will shorten the distance considerably by the way of Alturas.

I said that there were no large mills located on the Southern Pacific lines in western (22) Oregon outside of Portland except at points where they have competition of carriers, either rail or water or two-rail lines. I had in mind the Booth-Kelly Lumber
12 Company at Springfield. That is served exclusively by the Southern Pacific, except that I understand that the Oregon Electric serves it to some extent, and they ship some lumber out over it. The Oregon Electric doesn't reach the yard. The Oregon Electric doesn't extend south of Eugene. The Booth-Kelly Lumber Company was established many years before the Oregon Electric was built in the Willamette Valley. I do not wish to have you infer from my testimony that the mills at Klamath Falls have been located there because of competitive rail service at that point, prior to the construction of the Great Northern to Klamath Falls, but those are not large mills. I think perhaps all of the mills at Klamath Falls (23) are mills that were constructed prior to the entry of the northern lines into the Klamath Basin. There may have been one or so constructed since. For example the Weyerhaeusers have announced that they will put up what they call a large mill—it has been announced by the Weyerhaeuser Timber Company that they will build a large mill at Klamath Falls. I would not say that the Pelican Bay Lumber Company and the Iwauna Box Company and the Big Lakes Box Company are large mills in the sense in which you speak

of a large sawmill to-day, like the large mill up at Lewiston and the one contemplated by the Weyerhaeusers at Klamath Falls, and the one up at Everett, Washington, or even the mills at Bend, Oregon.

Q. Do you expect, Mr. Corey, in the future to see any more large mills built at points in western Oregon that are not on tidewater, regardless of the amounts of rail service which may be afforded?

A. I think so; yes. I don't see how we are going to market our lumber without.

As to where in my opinion any such large mills would be developed, I can't conceive of logging the timber from the west (24) slopes of the Cascade Mountains to the coast for manufacture. I am not particularly aware that a large portion of the logs sold on the Willamette market at Portland are now brought in from
13 considerable distances by rail. I know they are not hauling any logs by rail over the Southern Pacific's main line into Portland. I am not particularly familiar with the Eastern & Western Lumber Company's logging operations out on the Molalla, in Clackamas County. I just know that it is in existence. The Southern Pacific Company's Tillamook branch goes to the summit to obtain logs for the tidewater mills. From the summit they can go east and west. In other words, they haul from the summit of the coast range toward the mills located on water at Portland, and they haul in the other direction, toward the Pacific Ocean on the west slope of the coast range of mountains. I do not claim to have (25) very definite knowledge as to the present trend of the log movement and log hauls in the State; I have never had occasion to study those. My idea of the main purpose of the construction of the cross-State line is to afford a shorter route on through traffic in both directions, west and east.

Q. Would any carrier be justified, in your opinion, in constructing that mileage, which you say is 181 miles, across central Oregon if it didn't have access into western Oregon, actual physical access into western Oregon?

A. We hope to present a case here that will justify it under the 1920 transportation act.

Q. Well, have you changed your opinion in that regard since the former hearing in this case?

A. We have made different studies which we have prepared to put into the record.

I testified at the last hearing that the requirements of the Union Pacific to build such a line would not be jusified if it were to end at what we then called Odell, and which is now Crescent Lake. (26.) And it had to be maintained by the tonnage on that line only,
14 to be developed along that route. It must have tonnage from the west of the western terminus in order to make it pay, in order to justify the line.

I made the observation that large mills seek rail service in a competitive way, that is, they generally seek a location where competitive rail service may be availed of. It is true that has been my observation with respect to the large mills that have been constructed in the timbered areas of the Pacific Northwest during the past several years. They locate where they can get competitive service. All of these mills whether they are located on the Southern Pacific line, or on the Oregon-Washington Railroad & Navigation Company lines, or on the Spokane, Portland & Seattle line, are afforded joint rates with other railroads. (27.) It is my observation that the mills do not go to them if they can get a location where they can be served by a joint operation like those I referred to.

Q. And it is also your conclusion, I take it, that the great stands of timber to which you refer located south and west of Eugene will be manufactured by large mills?

A. I don't believe I stated by large mills.

Q. Well, you don't think that would be the case, would you—if they locate on a single line of railroad they won't build large mills in that territory, would they?

A. Oh, I anticipate we will have hundreds of small mills all through those mountains.

Q. Well, now, if it is an advantage to have a competitive operation into a manufacturing point, cut this lumber and market and transport it, how will that result be accomplished by taking this cross-State line from Harriman, on the Burns branch, and building it across the desert to the side of the mountain on the east slope of the Cascade at Crescent Lake? Wherein will that construction afford any service to mills on any single railroad line in western Oregon?

A. Well, it is expected that if the line is once completed to connect with the Natron cut-off it will eventually get into the (28) Willamette Valley.

We have prepared routes for its construction into the Willamette Valley. We can justify, we are quite sure, before this hearing is completed, the construction to a connection with the Natron cut-off at Crescent Lake. I am not prepared to put in that part of the testimony at this time. That can be put in by those better qualified than I am.

Q. Well, I am not questioning your motives or your conclusions, you understand, Mr. Corey, but I want to call your attention to the fact that it doesn't reach the timber at all, and you say that competitive operation is essential for this timber. Now, you don't accomplish a competitive operation by stopping the line at Crescent Lake, do you?

A. Not at Crescent Lake; no. There would be no competition between carriers in the Willamette Valley, any more than there is to-day.

Q. Now, suppose this line was built from the Burns branch across to a connection with the Central Pacific at or near Crescent Lake, as you petition for, how will it successfully compete with the Southern Pacific, when the Southern Pacific (29) completes its construction from Klamath Falls to Alturas?

A. They would still be the shorter route.

The mill at Springfield is a large mill for Oregon. It isn't a large mill compared with the large modern mill of to-day. It is as large a mill as there is in western Oregon, except perhaps the mill at Vernonia that is served by the tracks of the Southern Pacific alone. The product of that mill is shipped like the others to the east and to the south.

16 The Southern Pacific line goes as far as Ogden, Utah, with a connection with the Union Pacific Railroad; and it goes south clear through the entire length of the State of California into Mexico.

As to what inducement there would be for anyone connected (30) with the origination of that traffic to take it away from the railroad that is serving the mill with its own track and give it to the Oregon-Washington Railroad & Navigation Company at Crescent Lake: It isn't lumber alone. We must also market our products in western Oregon—take for instance the fruit, broccoil; it must move by the shortest time possible to the markets of the East. We have to come in competition with the same products grown in the Middle West, apples from Michigan and the Ozark Mountains, West Virginia, and so on. Those now move down to Roseville and are turned over at Ogden. It takes a long time in transit. You can answer better than I can why they don't give it to the Oregon-Washington Railroad & Navigation Company in Portland. It is a good deal shorter. I would say it is 700 miles shorter. (31.)

Speaking of the fruits in western Oregon, I think Salem is perhaps the biggest fruit center for the packing and shipping of fruits in western Oregon. And that is only fifty miles south of Portland. Still the products move south, the long haul over the Southern Pacific, despite that the Oregon-Washington Railroad & Navigation Company line at Portland is available and is a much shorter route. And that is a well constructed and efficiently operated railroad. I think it is much better than any you would expect to be built across the center of the State of Oregon for many years.

17 Q. Now, if the Oregon-Washington Railroad & Navigation Company can't get that business now from the Southern Pacific at Salem, how is it going to obtain it from the Southern Pacific at Crescent Lake?

A. Well, the Union Pacific, in my opinion, will eventually enter the Willamette Valley. We must have competition (32), surely. It is the largest area in the United States, I think, or the most productive area, without competition between carriers.

Q. You think if the Oregon-Washington Railroad & Navigation Company was compelled to construct across to a connection at Crescent Lake, that it would then find it necessary to go on the rest of the route to get the traffic; is that it?

A. That territory must be served by more railroad lines. Either the Southern Pacific or Union Pacific, or some line, will have to build more railroads into western Oregon.

Respecting the large reclamation project in southwestern Idaho, the Owyhee and Warm Springs projects that the Government is now developing, I know where this project is located but I haven't been over there since they started construction. That is tributary now to the main line of the Oregon Short Line Railroad Company. (33.) The construction work is carried on and made possible by transportation afforded by the Oregon Short Line Railroad Company from its main line. I think the distance from the stations serving it, say Ontario, is shorter via the Oregon Short Line and the Oregon-Washington Railroad & Navigation Company's present line to Portland than the distance would be if the cross-State line were built. I don't know exactly. Portland isn't the only market for those products. I am not belittling the importance of the Portland market—it is a substantial, important market. If the
18 distance is shorter to Portland via the present operated railroad serving this project, the distance to the Puget Sound cities, Tacoma and Seattle, I think, is shorter. And the distance to Astoria would be shorter, but you will find that those are not (34) the market. The market is in California for those products—is today; probably will be in the future. As to what part of California will furnish the markets for Southern Idaho: There is much moving now into Los Angeles. They have difficulty in reaching the Bay points, however. It is my information that Los Angeles is the important California market for the southern Idaho products; and the obvious reason for that is that the Bay points in California, San Francisco, and Oakland, are furnished by large, productive, fertile valleys in central California that furnish a large volume of traffic.

I am familiar with the so-called Wells cut-off that extends from Rogerson, Idaho, to Wells, Nevada. The figures showing the distances from the Owyhee project to San Francisco via the Rogerson-Wells line and the Southern Pacific and via a cross-State line built and connecting with the Southern Pacific at Crescent Lake will be placed in the record by other witnesses (35) with accuracy. I believe the cross-State is probably the shorter route.

As to where on the Pacific coast in recent years any mill larger than the Booth-Kelly Lumber Company mill, or the Western Lumber Company mill at Westfir, has been constructed in the interior—by interior I mean that territory from which a mill doesn't
19 have contact with tidewater—I believe both the mill at Bend are larger. The new mill at Lewiston, Idaho, is many times larger. Over east of the Cascade Mountains there isn't any

other out except to locate the mills in the timber, but getting over into territory comparable with western Oregon, west of the Cascade Mountains, it is true that the Long Bell Lumber Company and those other big operators are coming out here and locating where they have not only rail service but service by ocean transport. As to whether there is any mill located in this western strip of territory in Oregon and Washington the last few years any (36) larger than these mills located on the Southern Pacific lines in western Oregon, unless there has been tidewater available, I am not posted much on what California and Washington has in the way of sawmills.

The Willamette Valley proper is quite well supplied with rail construction. I didn't say it was too well. There is going to be opportunity to use those lines in the future.

Q. Well, do you think there is need for as much mileage as there is between here and Salem and Albany, for instance, on both sides of the river?

A. Not at the present time, under one operation, owned by one railroad.

Q. What part of western Oregon?—by western Oregon, of course, I mean everything west of the Cascade Mountains—is, in your judgment, in need of any new construction, other than (37) possibly that construction which should be carried on as a part of logging and mill operations and amortized out of the mill and logging projects?

20 A. There are ports that need direct connections with the East. Coos Bay, for instance, would afford one of the shortest routes between Chicago and the Orient, if we had a direct line running east and west from that point.

Q. Well, in addition to the Southern Pacific Company's lines now from Eugene into Coos Bay, at a cost of fourteen or sixteen million dollars?

A. Well, that is a branch line of the Southern Pacific, and any tonnage must now move down via Roseville, rather a circuitous route. It will never develop as a port like Portland or Astoria, Tacoma or Seattle, under present conditions.

Q. Well, it is apparent that you don't understand my question, Mr. Corey. Let me state it again, perhaps a little differently. What part of western Oregon is there, if any, that is entitled or now entitled, in your opinion, to have rails laid into it by a major steam railroad, and which already hasn't such rails?

A. Well, you must bear in mind we are not building the railroads only just for to-day. We are preparing for the future when the demand comes for our lumber, and the lumber in the East, Wisconsin, Minnesota, Michigan, is practically exhausted. (38.) Pine in the South is practically exhausted. There is going to be a demand for our lumber in the very near future, which we will be unable to supply in the time necessary to meet competition from the neighboring States.

Q. Well, still that isn't an answer to my question. Take the map of western Oregon, and is there any part of it which new major railroad construction is now justified?

21 A. There are sections of the west side from which the vast areas of timber is now inaccessible due to the lack of rail construction—take it down in Douglas County, that county in the southwestern part of the State.

Q. Well, the Southern Pacific main line runs right through Douglas County, does it not?

A. Yes; but it doesn't enter the timbered section.

Q. What do you call the timbered section?

A. The western part anywhere—I understand there is about fifty-six billion feet of standing merchantable timber in Douglas County.

Q. Well, you are aware, are you not, that the Southern Pacific Company's Coos Bay branch, which is, I think you will agree, an excellent railroad——

A. It is.

Q. Capable of handling very heavy traffic, runs through the extreme western corner of Douglas County, and wouldn't you (39) say that that is near enough to the timber belt for major railroad construction?

A. It would require many branch lines for logging roads, perhaps.

Q. Yes; and don't you think it is the sensible thing that these various areas or potholes of timber here and there, even though they be expended, should be reached by an inexpensive logging railroad construction, in so far as that is possible?

A. With the least expense possible.

Q. Yes; but have you in mind now any part of this area that we have been talking about that really justifies what we call standard branch line railroad construction, to say nothing of main line?

A. Not right to-day; no.

22 Q. That is right.

A. There is lack of competition of carriers for this entire district.

Mr. DEY. That is all.

Mr. SPENCER. Mr. Dey's inquiry provokes one from me, if I may. You say that you are planning this construction and development for the future. You have in mind that the cut from the southern pine mills will shrink, and that will call for a greatly increased demand of our western fir?

A. Yes.

Q. Is that as I understand you? (40.)

A. That is true.

Q. Now, have you made any estimate as to when actual conditions will arrive wherein the output from the southern pine mills will substantially subside and the demand for our Douglas fir greatly increase? How long will it be, in your opinion?

A. All that testimony is in the previous record, and I am going to have some more in this. They will be importing lumber into certain sections of the South in the very near future. I understand in a small degree it has already begun.

Q. By you yourself wouldn't make an estimate——

A. No.

Q. As to when the construction of the road you are talking about would be required?

A. How is that, please?

Q. I say, you wouldn't make an estimate when this railroad construction would be required to take care of this increased output of Douglas fir?

A. I think it is in the very near future. (41.)

23 Redirect examination:

Other than to shorten the distance somewhat over the present route through Roseville, the proposed or discussed Nevada or California line which has been referred to as the Modoc Northern would not serve Oregon. We are asking for construction of a line or railroad in Oregon. They are offering a substitute by building a line in California. About 17 miles of the mileage of the proposed Modoc Northern will be within the borders of the State of Oregon. That route would be some 200 miles shorter for transcontinental traffic from western Oregon to destinations east of Granger. That route is considerably longer, approximately 200 miles longer, than the proposed route which the commission is suggesting in this case. It would not serve at all the now unserved area of central and eastern Oregon which is mentioned in the complaint of the (42) Commission, nor western Idaho.

From my familiarity with tonnage originating in western Oregon I can say there would be a large volume of eastbound tonnage which might be expected to be routed via the cross-State line and the Natron cut-off of the Southern Pacific. Taking into account the fruit, the fresh fruits and vegetables of western Oregon, it is my belief, from my familiarity with the needs of the producers of those commodities, that they would insist on a direct and short routing of their commodities, and that such traffic would be sent via the cross-State line.

In addition to the connection with the Natron cut-off, other traffic from north and south from Bend and Klamath would be available for routing via the cross-State line. In other words, not only in connection with the tonnage of Western Oregon but all exist-

24 ing central Oregon tonnage producing areas. (43.) It would provide a new and more direct outlet for the lumber of both the Bend and Klamath Falls Territory. This routes as proposed by the commission would be substantially shorter than the routes now traveled from both of those producing areas to the eastern markets; it would be a still shorter route than the Modoc Northern from Klamath Falls to Chicago.

There are several possible routes to connect other areas of western Oregon by direct lines at Crescent or elsewhere on the western terminus of the proposed cross-State line. There is the pass on the Santiam, probably two favorable crossing points in that locality; one across the Cascades to the head of the Rogue River down in Douglas County. Those routes would open up and serve areas now totally unserved (44) by rail lines. In the Santiam Basin there is a substantial area and a substantial quantity of timber now totally unserved by any rail line. They are now extending a line into that territory. This is part of the Oregon Electric. If continued on up the Santiam Pass and through the Hogg Pass, that line could be conveniently connected with the western terminus of the cross-State line, that is, it could connect at Bend.

There are substantial areas of timber in southern Oregon that are not now tapped by rail facilities. (45.) I will describe what large areas of timber particularly there are in western Oregon that are totally untapped by rail facilities: The Southern Pacific has a branch line from Eugene to Coos Bay, but south of that point there is no other branch into the timber of the southwest in Coos, Curry, and Douglas Counties. There are no facilities in Coos, than the line I have just described. And east of the line of the Southern Pacific Company in Jackson and Josephine Counties there are large areas of timber that are totally unserved by rail facilities. And east of Eugene on the McKenzie watershed there is also a large area of timber totally unserved. Convenient routes exist whereby this unserved territory could, by reasonably short extensions, be brought in contact with the western terminus of the proposed cross-State line. (46.) I could hardly concede that the expression "pot holes of timber" is an accurate description of any of Oregon's timber.

I know where the Rogerson-Wells cut-off is located. It connects from Rogerson, Idaho, to Wells, Nevada. It is a part of the Oregon Short Line, Union Pacific system. The length of the cut-off is approximately 100 miles. I know the general character of the territory that it traverses. It is a desert from one end to the other. I can see no difference in principle between the extension by the Union Pacific system to the Southern (47) Pacific of a line of railroad approximately 100 miles long from Rogerson, Idaho, to Wells, Nevada, and the proposed extension of the Union Pacific system to the Southern Pacific from Crane, Oregon, to Crescent Lake, Oregon. I mentioned that if the proposed cross-State line had its western terminus north of Odell or Crescent Lake, it could then be extended across the Santiam Pass, which is an old pass. From Bend westerly across the Santiam Pass until you reach the farming section of the Willamette Valley, I believe it is practically a solid body of timber. I do not know what the mileage through the timber would be that a railroad constructed westerly would penetrate. (48.)

26 Q. Mr. Corey, in connection with this Santiam Pass, or what is known as the Hogg Pass through the Cascade Mountains, wouldn't it be on a more direct line taking Burns as a terminus, wouldn't it be a shorter route using Burns as a terminus to connect with the Prineville Railway at Prineville Junction?

A. A shorter route between what points?

Q. Between Hogg Pass and Burns; isn't that a direct line practically?

A. Practically.

Q. Yes; you say it is?

A. It is.

Q. And from your knowledge of the country wouldn't that route skirt a solid body of pine lumber after leaving the timber on the Cascade Mountains, from Prineville to Burns?

A. That line would be nearer lumber tonnage practically most of the route than the direct cross-State line.

Recross-examination:

Speaking of the availabilty of the Hogg Pass to the cross-State line, if the objective of the cross-State line were the Hogg Pass, I would not (49) have it connect at Crescent Lake but at some point farther north. The Hogg Pass is closer to Bend and Prineville than it is to Crescent. The timber I referred to as being available in the Santiam district, is now being approached by an extension petitioned for by the Oregon Electric, proceeding southerly and easterly from Albany.

Q. And that timber is much more accessible to the Oregon Electric's contemplated line from Albany than it would be to the so-called cross-State line terminating at Crescent; isn't that true? That timber would be much more——

26½ A. The timber in the Santiam district would be much more accessible from Albany; yes.

With reference to the statement that the cross-State line could also obtain business from Bend and from Klamath Falls, there is a rail connection between those points and Bend and Klamath Falls. Bend's principal industry is manufacturing timber. Two of the largest mills in the country (50) are operated there and furnish tonnage; the markets are east. The cross-State line we have prayed for does not touch Bend; it is farther south. The Great Northern operates in connection with its Oregon Trunk into Bend and on its own account south from Bend to Klamath Falls. As to whether I expect that any of that lumber moving to any eastern market the Oregon Trunk or the Great Northern would turn that tonnage, any of it, over to the cross-State line to move, I don't see any reason why some of it would not go over the cross-State line.

27 The Great Northern will probably need all the tonnage it can get down in that country to justify its extended operation from Bend to Klamath Falls. (51.)

Q. You would not, after supporting its application to go into Klamath Falls, suggest that it should be stripped of its tonnage and turn it over to a cross-State line, would you?

A. No; not all of it, surely.

Q. Mr. Corey, is it your thought that the fir timber on the west slope of the Cascade Mountains, in what is called the Santiam region, would furnish lumber traffic for eastbound haul via the cross-State line, should the cross-State line be built?

A. No.

Q. Over the Hogg Pass?

A. No; that was no material point.

Q. What was the point, then, of your testimony showing the amount of timber in the Santiam country? You answered some questions a moment ago to the effect that if the cross-State line should be built through Bend or through Prineville and over what is called the Hogg Pass into the Willamette Valley, that it would pass through heavy stands of timber all the way from Bend or Prineville, or near those points, over into the Willamette Valley; would it get any tonnage from that fir timber?

A. My reply was to the question of the intervenors. Bend and Prineville, who have intervened for a line from Bend to Burns (52) skirting the timber district, then via the Hogg Pass into Albany. My answer did not run to the cross-State line that we are stressing in this case.

Q. Well, you agree, do you not, that that fir timber in that
28 country in that Santiam region would not furnish lumber for any cross-State line, even if a cross-State line was built over that route?

A. Very little that would go over the cross-State line.

Q. The fact is that that timber will not be manufactured into lumber in the territory, but probably will be hauled out in the form of logs to mills at Portland or on tidewater; that is correct, isn't it?

A. Either there or manufactured at Albany.

Q. Well, don't you know, in point of fact, that the lumber manufacturers pretty well refuse to build very large mills now anywhere except on tidewater—the fir lumber mills?

A. That is quite true, but, as I understand it, large areas of the Santiam timber are owned by officials of the Oregon Electric and Northern lines. I can't conceive of them hauling it to tidewater to have the water competition compete with them with the different markets.

By referring to officials, I mean the timber ownership of L. W. Hill. I don't know any other official of the Great Northern who owns timber in there, unless Long owns some. (53.) I understand he does. I understand Weyerhaeuser has. It is my opinion that their ownership or Hill's ownership is likely to change the situation. They would not haul it down to tidewater and have it manufactured and hauled by boat, when he is interested in transcontinental rail-

roads. He will get the tonnage for the transcontinental railroads, if he can. If it was manufactured at Albany, Albany is seventy odd miles from Portland and Portland is the terminus of these Northern lines and they have the Oregon Electric extending from Portland to Albany; if they got that tonnage eastbound it would move over those routes through Portland. (54.)

29 Q. Now you answer Mr. Spencer as agreeing that the pine tonnage, pine lumber originating on the Bend-Klamath Falls line of the Great Northern will, so far as the Great Northern can control it, be retained the full length of the Great Northern haul. That is reasonable to expect, is it not?

A. It is.

Q. And you would not expect that the tonnage from the Klamath mills coming north on the Great Northern would be turned over to the cross-State line at the point of intersection south of Bend?

A. Not unless they are properly compensated for turning the tonnage over to the cross-State line.

Q. How could they be properly compensated, Mr. Corey? What do you mean by that, some abnormal——

A. In the division of the transcontinental rate for the haul.

Q. Some abnormal division which would give the originating line enough to compensate it for the loss of the long haul; is that the idea? You mean that the Great Northern for its haul from Klamath Falls, a hundred miles or so, up to the intersection, might get so much for that haul that it would be willing to give up the haul of that lumber all the way east to Chicago, for example?

A. I never anticipated a great movement in that direction (55) in any event.

The two mills at Bend are now adequately served by the Oregon Trunk and Union Pacific lines, and unless there is some necessity for prompt movement or shorter routing, there is no necessity for another line.

They are not here complaining of the circuitous route over
30 which their cuttings must move.

Q. I understand you, Mr. Corey, to say that you would not expect the Great Northern to turn over, at Crescent Lake, to the cross-State line, the business moving out of Klamath Falls, nor would you expect the business which it originates at Bend to be moved by the Great Northern down south to Crescent Lake and then turned over to the cross-State line, and I assume, under the same principle and for the same reasons you would not expect the Southern Pacific Company to turn over to the cross-State line the traffic which it originates upon its lines either in the Klamath Falls Basin, in the Klamath Basin, or elsewhere?

A. Not unless it was adequately compensated for doing so. I haven't been over the Rogerson-Wells line. I have been to both ends of it. There are 94 to 95 miles in between those ends. I understand there are some minerals in there, but don't know whether they are

operating or not. I know nothing of the so-called Galena mine at Contact; nor the Galena mine operated by John Gray. (57.) I know, however, the mineral resources on the lakes in this so-called desert where we are trying to have this road constructed will produce at least as much or more tonnage than the resources that you have just mentioned.

Redirect examination:

I understand in handling lumber to the eastern destinations, Omaha, Chicago, and east, from the Willamette Valley either via the Roseville gateway and Ogden and east, or via the Portland gateway and the Union Pacific and east, the rates are blanketed. If the traffic from the Willamette Valley, lumber traffic originated by the Southern Pacific moves via Portland gateway, the Southern
31 Pacific handles it only to Portland. (58.) And from Portland it goes over the Union Pacific or one of the Hill lines. I am aware that joint rates on lumber originated by the Southern Pacific in the Willamette Valley exist via Portland to eastern destinations on the same basis as exist via Roseville and Ogden to the east. Also, that there are joint rates on lumber originating in the Willamette Valley via Portland in connection with the Great Northern and Northern Pacific to many destinations in North Dakota, Minnesota, and Wisconsin. In the instances mentioned of movement of lumber beyond Portland, either in connection with the Union Pacific system lines or the Northern Pacific or Great Northern, there is involved in every instance at least a two-line haul.

Q. Would there be any more involved than that where the Southern Pacific originates lumber in the valley and turns it over at Portland to the Union Pacific, or the Great Northern or the Northern Pacific, for further transportation east on joint rates, and joint rates on Bend lumber or Klamath Falls lumber under which the Great Northern or Southern Pacific (59) originating the lumber would turn it over to the Union Pacific at the junction with the Cross-State line for transportation east?

A. I can see no difference.

Exam. ROGER. Mr. Corey, you have mentioned 181 miles in the first part of your testimony. Does that cover the distance from Crane or Harriman over to Crescent Lake only?

A. Yes.

Mr. SPENCER. 185 miles is the figure.

Exam. ROGERS. What, Mr. Spencer?

Mr. SPENCER. 185 miles I think is the correct distance, ac-
32 cording to our engineer. I did not understand that the line, rather the extension from Lakeview, was involved in this proceeding. We know for a fact that a mill would not locate on a point served by one line only as compared with a point served by more than one line, usually on account of the supply of cars. Another reason is that a mill wants every market available. Two lines make

more markets available (60) if one serves the northern part of the United States and the other one the southern part of the United States, as we have in this instance. Take all the transcontinental lines, Union Pacific, Great Northern, Northern Pacific, Milwaukee. The Southern Pacific serves the southern part. As for any other reasons than the car shortage and wider markets, I don't know. The sawmill men could answer that better than I can. We have had no car shortage since the operation of the Natron cut-off was commenced, about two or three years ago—two years ago. When we had car shortage, we were short of all kinds of cars. (61.) We would have difficulty in getting fruit cars in here; at times we would be hundreds of fruit cars short; over two thousand cars shortage for several days for lumber, for the routing of lumber and other things. The Natron cut-off has not cured that situation, but it has facilitated in bringing empties northbound. Prior to the construction of the Natron cut-off, the Siskiyous was a sort of a neck of the bottle. They could not get through the old Siskiyous where it required several locomotives to move a freight train, where the freight train had to be broken up and hauled over piecemeal. That created a congestion of empties south of the Siskiyous and loads north. We have had car shortages simultaneously in the Willamette Valley and east of the Cascades. The car shortage west of the Cascades is causing the
33 most trouble. It is pretty hard to say what percentage. Two-thirds I should say offhand. (62.) We have had a shortage of several hundred cars on the Southern Pacific when the Union Pacific had an excess of that many. At present those conditions are being taken care of by the transportation act and the emergency powers of the commission.

The cross-State line would assist in the matter of car shortage by shortening the haul. Freight moves slowly and this would possibly shorten the trip of the car and of the load to the Middle West and return two weeks. If we assume that the Union Pacific was to build the extension from Harriman to Crescent Lake and the Union Pacific did not extend over into the Willamette Valley, a shortage of cars could be avoided by a means of joint rates through Crescent Lake between the two lines, such as would facilitate the movement of both loads and empties through that point. In that case the traffic would originate on the Southern Pacific and Union Pacific. (63.) I believe that the Union Pacific would bring in the empties to load on the Southern Pacific, inasmuch, as they would get the tonnage eastbound, just as they do at Portland to-day. They furnish cars at Portland for loading at Southern Pacific points occasionally.

Exam. ROGERS. Of what importance do you consider the construction of the cross-State line until some means of access is given into the Willamette Valley?

A. Why, we have built up our case at this time upon interchange at Crescent Lake.

Exam. ROGERS. The interchange between what lines?

A. The Southern Pacific and Union Pacific.

34 Exam. ROGERS. Then that contemplates the building of the extension by the Union Pacific?

A. Yes; that would necessitate a terminal or some method of interchange at Crescent Lake. We would have to have a yard at Crescent (64) Lake or in that vicinity. We just mentioned Crescent Lake as being a larger point; anywhere in that vicinity. Some point on the Natron cut-off. In that instance east bound traffic would originate on some line other than the Union Pacific, be routed over that line to this junction and then over the Union Pacific. The shippers would certainly route their traffic that way; it would be a short route.

Exam. ROGERS. Well then, why don't they route it now by Portland when the Portland route would be shorter than the Roseville route?

A. Well, they are discouraged from doing so. The Southern Pacific wants to hold it to its line, of course. The division——

Exam. ROGERS. Wouldn't they still want to hold it if this cross-State line was built?

A. They will unless they are adequately compensated for giving up this tonnage at Crescent Lake, which we believe we have a record here that will justify it.

Exam. ROGERS. You believe there will be some condition (65) existing if the cross-State line is established that does not exist now with respect to existing routes?

A. We expect to have an interchange, as they have at Ogden at this time.

Exam. ROGERS. Is there any more reason for assuming that that would exist at Crescent Lake than now exists at Portland?

A. Yes.

35 Exam. ROGERS. What are those reasons?

A. Well, we have witnesses coming on later to show all of that. I will state, however, that the costs of hauling the tonnage to-day to Ogden over the Southern Pacific route are such that the Southern Pacific is making little or nothing on that haul and delivering tonnage to the Union Pacific at Ogden. Possibly it would have a greater earning by delivering it at Crescent Lake.

The average haul to Crescent Lake would be greater than the average haul to Portland—not much difference.

Exam. ROGERS. Well, would it follow from that that the same savings to the Southern Pacific could be effected via Portland as apparently at this other point?

A. Well, I would prefer to wait until we have other witnesses who will testify on that point, to have our testimony in proper sequence. (66.)

If the cross-State line stops and connects with the Southern Pacific at Crescent Lake, this will not of itself afford competition to the Willamette Valley. The construction would not of itself

afford competition. However, under the previous decision of the Interstate Commerce Commission in the Southern Pacific-Central Pacific controversy the Interstate Commerce Commission, as we view it, still holds some jurisdiction in that matter. It may reopen the Central Pacific in order to allow common usership over that Natron cut-off into Eugene.

Exam. ROGERS. Do you contemplate some proceeding following this one and as a result of that proceeding, in justifying the cross-State line?

A. I think there probably will be a voluntary application on the part of the carrier itself to get into the Willamette Valley or to the coast.

As to that thought (67) that was the original intention years ago to get into the Willamette Valley and to the coast, into Coos Bay, particularly. There are other ports, however, on the coast,
36 without necessarily going to Coos Bay, which need development and which the Government has spent millions of dollars in developing, not yet adequately served by rail transportation. From the territory involved in the reclamation project, such products as usually are grown on irrigation projects will come. It will grow practically all kinds of farm products grown on irrigation projects. They are even growing a good variety of corn.

In regard to my statement as to the existing rail facilities in the Willamette Valley, the rail facilities, both on what are known as the east and west side lines of the Southern Pacific, are not now, nor have they been, extensively used, but most of the traffic goes via the main line served by the branch line. This is confined to the territory north of Eugene. (68.) Those lines are in the valley, not in the timber. I would expect all traffic to move over a cross-State line if the line was extended on over into the Willamette Valley. The Union Pacific would participate in all traffic west of the Cascades and principally south of Eugene. That includes traffic other than timber. All fruits, broccoli, which moves in many carloads and needs short transportation; developments along the coast; dairy interests. Industry is developing rapidly in Oregon. If existing rail facilities are not used to capacity, the extension of the Union Pacific over into the same territory would stimulate production. That always develops production in every territory, as Washington has been developed. Washington has more transcontinental lines running east and west, three north and south. California has five, Nevada four, Idaho four, Oregon has one east and west and that is down the Columbia River, practically inaccessible except to certain spots; one north and south on the west quarter.
37 I think there would be much additional traffic. (69.) The presence of a cross-State line would stimulate development generally over the entire State. Take Washington, a much younger State than Oregon, by reason of its transportation facilities, it has

developed, surpassed us in population and output of lumber, while we have the greatest amount of standing timber. On the south, California has far surpassed us. Oregon seems to be isolated.

We have figures to show what passenger traffic will move. As to the relative importance of the extension as between traffic originating on the extension and through traffic moving over the extension, it would practically have to be supported by the through traffic, very little along the line. However, we have witnesses to show that the mineral resources of the lakes will afford considerable tonnage, estimated as high as twenty-five carloads a day.

The Government owns (70) about one hundred fifty-six billion feet of timber in these so-called timber areas. There is no certainty as to when that would be marketed; not until we have rail transportation. If they did have rail transportation it would go on rapidly in the near future, due to the depletion of the lumber areas of the East. I don't believe the carriers own any of this timber. The Southern Pacific did own a large body, but no longer.

The bridge traffic that would move over this cross-State line now travels by a rather circuitous route around through Portland, around through Roseville, and western Idaho tonnage goes as far east as Ogden and then back to California points.

When shippers are served by one railroad, they are not exactly their own free moral agents in the privilege of routing their own freight. (71.) Tonnage originating on the Southern Pacific is invariably hauled to market by the Southern Pacific. A very
38 infinitesimal part of it is turned over to connecting carriers at Portland. There are through rates in effect via Portland. The shippers don't use them because they are induced to ship the other way. Under the proper connecting charges, at least at Crescent Lake, the shippers would not be induced to ship the other way if the cross-State line were in existence.

Exam. ROGERS. Now just what do you mean by that? Do you think that the rate via Crescent Lake would be lower than via Portland, we will say, to the same common eastern point?

A. It would not be lower but it would shorten the time to markets, which is the principal element. The time via Portland would be shortened to certain parts of the East. (72.) It would be shortened but no large volume moves in that direction. Your assurance that shippers would exercise their option to route over this cross-State line any more than they now exercise it in routing through Portland lies in the shortening the time in which it will reach the market. For instance, broccoli that has been raised around in Douglas County this last season has gone through Portland on account of shortening the distance—shortening the time in which it will reach the market.

Exam. ROGERS. What about the timber, lumber?

A. The division in the rates is the principal reason that the shipper is influenced to ship over the Southern Pacific lines.

Exam. ROGERS. What does the shipper know about the division of rates?

A. The shipper does not know. But still the shipper has the option as to how he shall route.

Exam. ROGERS. Well, the question of divisions, then, would that furnish any explanation as to why the shipper does not route through Portland as compared with Roseville?

39 A. Only the solicitors of the carriers solicit that business and want to have it originated over its own line.

Exam. ROGERS. Then how would you fix the division by (73) Crescent Lake in order that the solicitation of traffic would go via that route instead of the other route?

Mr. ELLIS. We have another witness who will go into that quite thoroughly in detail, Mr. Examiner.

Exam. ROGERS. Well, if Mr. Corey does not know he may say so.

The WITNESS. I prefer to leave it to the witness who is better qualified to answer than I am along that line.

In stating that the Great Northern could not be expected to give its Klamath Falls business to the cross-State line, we expected the Union Pacific to build the cross-State line being in that territory and having made the original survey. If the Southern Pacific built the cross-State line, the result would be perfectly agreeable to the public service commission; all the carriers are made defendants in the matter. (74.) I don't believe it would create any change in the existing routing arrangement via Roseville and these other points, if the Southern Pacific built the extension. I think it would have the interchange at Harriman or Crane instead of at Crescent Lake. I think the traffic would move over to Harriman with proper encouragement. I think either the Union Pacific or Southern Pacific would be the logical lines to build it. The Hill line would necessarily have a backhaul if it would want to haul onto its own transcontinental lines, to connect with the line south from Bend and then north to their transcontinental lines. It has no outlet east. I am speaking of the tonnage that originated in that locality. It would have on that that is on the cross-State line. (75.)

Mr. HART. I am not going to ask any questions. I was going to ask whether or not, in view of the answers just given, it is not now clear that there is no demand in this case that the Great

40 Northern or the Oregon Trunk build this cross-State line, or any part thereof, as a supposed extension of its lines.

Mr. ELLIS. I would not want to stipulate that. I think the complaint should stand until we hear the evidence in the case.

Mr. HART. The complaint does not make clear what purpose there was in joining the Great Northern, Northern Pacific, Oregon Trunk, Oregon Electric, and others, as parties defendant in the case, and in view of these answers just given by the witness, who speaks, or who gives, as I understand it, the postion of the complainant, in view of these answers I would like to know if it is not now clear that there

is no demand in this case that the lines I have mentioned, or any of them, shall be required, by order of the commission, to build this cross-State line, or any part thereof?

Comr. McMANAMY. Well, Mr. Hart, whom do you expect to answer that question at this time?

Mr. HART. I thought that Mr. Corey would answer that question. (76.)

The WITNESS. I prefer to leave it to the attorneys in the case, upon the completion of the hearing.

Mr. HART. Well, if the commission please——

The WITNESS. Our complaint is that either one or all jointly construct it.

Mr. HART. Does that mean that it would be left to the Interstate Commerce Commission to parcel out the construction? In most of these cases the complainant is required to state his petition. I thought that was what the examiner's questions were designed to bring about. And my suggestion was that we have a more precise statement of the complainant's position.

Mr. ELLIS. The complaint itself states the complainant's position. Mr. Corey has stated his opinion. Now I don't think we can go any further at this time, Mr. Hart.

41 Mr. HART. Well, that is for the commissioner to say. I only make the suggestion.

Comr. McMANAMY. If counsel for the complainant desire to go into that further at this time they may do so.

Mr. HART. I though you might be interested in knowing what the complainant's position was.

Comr. McMANAMY. Mr. Corey, just one question before recess and then we will excuse you. As I have understood your statements, there are two what may be termed important issues involved. One relates to the development of the section of Oregon east of the Cascades by providing railroad transportation (77) through central Oregon the other involves additional railroad facilities for the territory lying west of the Cascades. Now which of those two issues may be considered the major issue in the minds of the Oregon commission as representing the people of Oregon?

A. The greater volume of the traffic would be unquestionably eastbound, affording a shorter haul for the tonnage of western Oregon by this cross-State line; developing central Oregon; also furnishes a shorter route than now exists to Pacific coast points for all western Idaho and central and eastern Oregon.

Comr. McMANAMY. Just one more question. How does the fruit from the Rogue and Umpqua Valleys go, via Portland or via Roseville?

A. Mostly via Roseville.

42 L. E. BEAN was thereupon produced as a witness on behalf of complainants and, having been first duly sworn, testified as follows:

Direct examination:

I am a member of the public service commission of Oregon, and have held that position since January 1, 1927. Prior to my connection with the public service commission I was engaged in practicing law at Eugene for twenty-five years. Prior to becoming a member of the commission I served in official capacity as a member of the legislature for a time, but I don't know why you bring that up. I was speaker of the house of representatives in 1921. (79.) I was born and raised in the State of Oregon. As far as the State and its resources are concerned, I have been in every county in the State, and I think I am quite familiar generally with the State, and to a considerable extent with its transportation system, of course. I was not a member of the commission at the time the original proceeding was brought before the Interstate Commerce Commission for railroad construction. I was a member at the time the complaint now being heard was prepared and filed; that was prepared after I became a member of the commission.

For the purpose of this case I have made an investigation, in a general way, to determine the extent to which the proposed construction is required.

As to the nature of my investigation and what I found the situation to be so far as transportation facilities and requirements are concerned: When I became a member of the commission, or
43 shortly after, there seemed to be a general public demand (80) over the State to bring this case. I naturally got interested in it because of that public demand, believing that it was for the general development of the States. Oregon is one of the older States of the West, admitted to statehood in the latter 50's. Washington, on the north, was admitted much later. Washington and California have developed rapidly, while Oregon has seemed to not go forward, and the general demand over the State on the commission to bring this case now before the Interstate Commerce Commission caused me to look into the matter and wonder why. Oregon's resources are undoubtedly the equal, if not far greater than Washington; has more farming land. Oregon is peculiarly situated. You take from the north we have a range of mountains ranging to five thousand feet and upwards, running the entire length of the State to the Klamath River, the border line, to the California line, practically. Then we have another range of mountains running south, commencing between the Columbia River and the coast, and extending south following the coast line to the California line. The Cascade Range of mountains is unbroken. The Coast Range is broken only in two places: the Umpqua and the Rogue River cut through. The Coast Range of mountains is almost a solid belt of timber. There are here and there old burnings that the hillsides are depleted, but, generally speaking, it is a solid body of virgin fir timber running from the north clear (81) through to the south, to the California line, and that is true, also, of the Cascade Range of Mountains. The west

slope of the Cascade Range is virtually a solid body of virgin
44 fir timber. The east slope of the Cascade is fine timber, and almost a solid body of timber extends from north to south.

Lying between these two ranges of mountains is the Willamette Valley, commencing at Portland and extending south to Cottage Grove, a distance of 145 or 150 miles, probably 30 to 35 miles in average width, capable of producing unknown quantities of the products raised in this altitude.

Then we have the Umpqua Valley, lying south, and then the Rogue River Valley, south of that, and extending to Ashland, or almost to the California line.

West of the Cascade Range of mountains, lying at the sea level altitude, is a grass and dairy country where the grass is green the year around and never dries up. That country is—take it from, you might say, all the way from Seaside to the California line is hardly developed. There are spots like in the Tillamook country, there has been a considerable development, where there is a great quantity of cheese produced and dairying products. Then there is very little development from thereon through to Coos County, and around Coos Bay, Myrtle Point, Coquille, is a very fine (82) settlement and considerably developed, and that is about the extent of the expensive development of the entire coast country.

Now, the people of the coast country and the people of the Willamette Valley and the Rogue River and the Umpqua Valleys feel, from the expressions that I get, that the country hasn't developed as it should develop, and that the reason of that development
45 is lack of rail transportation, and they cite us to Washington on the north and California on the south. You take Oregon from the Columbia River Gorge south, and extending on down to Roseville in California, there isn't a single line of rail transportation east, a distance of some six or seven hundred miles.

Now, the Public Service Commission of Oregon feel that in order to develop Oregon there is call for an east and west line at some point near the central part of Oregon, and when you look at the map that great empire lying east of the mountains, with practically no development, certainly calls for a railroad, that is the public service commission's feeling, so, the case having been before the commission before, the complaint was filed on the basis of the old Harriman survey. In 1905, or about that time, the Southern Pacific and the Union Pacific were under the control of one management in Mr. Harriman's time. As I recall the history of it, Mr. Harriman laid out a plan of development for Oregon and (83) commenced and surveyed the line that is now the Natron cut-off, surveyed the line up the Deschutes towards Bend, and to connect with the line called now the Natron cut-off. He surveyed another line up the Malheur Canyon from Ontario Junction, running west.

The construction work was commenced on those lines. It was built as far as Kirk, from Weed through Klamath Falls into Kirk.

Construction was started on the Natron end from Natron, and built to Oakridge. Construction work was started at Ontario Junction and built up the Malheur Canyon and that big plateau now sometimes called the desert. There was also construction started
46 at the Deschutes River, and a line extended up the Deschutes to Bend. About that time, in 1912 or along about that time, the matter got into court, and there was a dissolution of the Southern Pacific and Union Pacific and this work all stopped—there was a dead end at Kirk, there was a dead end at Oakridge, a dead end at Bend, a dead end at Harriman, or Crane. Many millions of dollars expended and left uncompleted, and it was unfortunate for Oregon that the dissolution was brought about, stopped that work for many, many years. It has all been completed now, through the efforts of the Oregon Public Service Commission and on voluntary action by the carriers. The Natron cut-off is completed, the line from Bend to Klamath Falls—to a connection with the Natron cut-off and a common user into (80) Klamath Falls is completed. There remains only to complete the old Harriman survey the building of some hundred and eighty odd miles from Harriman to Odell, or Crescent Junction.

We believe that Oregon is entitled to develop, and we feel sure that it can not develop without further rail transportation, and this is the first step in the general development for Oregon.

As to how the transportation system of Oregon compares with the system serving the States to the north and the south: I am not familiar with the systems of railroad either on the north or on the south further than in a general way. Washington has four lines east, as I understand it, transcontinental; California has four or five, while Oregon has one, and that skirts the northern boundary of the State.

47 As to what precise needs, or transportation needs, I found in the various communities of western Oregon that I have visited since this case was instituted: It would be a long, long story to tell all the needs of the different communities and sections of Oregon. I could only touch it in a general way. Concerning some of the more important needs that were impressed on me in my study of the situation: If we take the timber of western Oregon, a hundred and eighty odd billion feet or more, variously estimated, the principal part of that timber (85) is ripe timber. Oregon carries 494 billion feet of standing merchantable timber, according to the best estimates we can get through the Government figures. Washington, on the other hand, has a little over 300 billion feet. Washington is cutting and shipping and getting to market between six and seven billion feet a year. Oregon, on the other hand, with the greater amount of timber, a little over—between three and four billion feet a year.

Now, Oregon's timber is just as good as Washington's timber; it is just as close to the consuming markets as Washington's timber;

it is ripe timber, almost—over 130 billion feet in forest reserves, belongs to the Federal Government, much of which is over-ripe. One of the great needs is for rail transportation east over a short route to get that timber into the market where it is wanted. (86.)

As to what the principal need is from the standpoint of the agricultural development of western Oregon: In all fruit industry, the Willamette Valley, the Rogue River Valley, and the Umpqua Valley are capable of producing a great quantity of fruits.

48 We do produce a good deal of fruit. Take it through the Umpqua Valley and the Willamette Valley around Eugene, around Salem, around Roseburg, a great quantity of prunes are produced. I don't know the facts, but I am told by the producers of those prunes that it is impossible to ship prunes to the markets of Chicago and New York and large cities that would consume them, consequently those prunes are dried, don't bring the revenue to the producer that he could get if he could ship them fresh. Then strawberries, all classes of fruits of that kind, that we raise in abundance, we are not able to ship them to eastern markets because of the time, the delays. In southern Oregon a great many pears are raised around Medford, a great pear producing country. I don't know the facts as to those. They tell me that the building of this cross-State line, the routing of their pears over that line would be from 20 to 24 hours shorter to the market than they now have. The broccoli growers of Douglas County, I think they ship 700 to a thousand cars a year of broccoli—the same thing as to that. One of the broccoli growers in Roseburg told me last spring that if they continued growing broccoli, unless the way they were shipping (87) it this season as an experiment proved successful, by enclosing each head of broccoli in a sealed oiled paper instead of shipping it in the leaf, they would have to go out of the broccoli business, because their broccoli was deteriorated when it reached the markets.

As to the demands or needs, as I find them, of the western Oregon dairy industry, so far as it may be affected by the proposed construction: Dairy men tell me through the Willamette

49 Valley, through the Coos County section, that the land is becoming too valuable for the growing of hay. They could consume a great quantity of alfalfa hay that would be raised on the east side of the mountain and use their land for pasturage. As to requirements from the standpoint of live stock producers of central and eastern Oregon and southwestern Idaho, they would be given the benefit of two markets where they now have one. If they were shipping their live stock from central-eastern Oregon or southern Idaho, they could ship to Odell Junction, or to connection with the line to Klamath Falls. If the markets in California (San Francisco) were better than in Portland, they could divert their shipments to California. If better in Portland, they could divert their shipments there. I understand they now have one market—Portland. (88.) This live stock originates in central-eastern Oregon and southern Idaho.

I am generally acquainted with the plateau region or territory, sometimes referred to as the high desert, as I have crossed it several times in different ways; I rode the range there seven years, years ago. It is often called a desert but I don't look upon it as a desert. There is a broad expanse of land, probably 75 or hundred miles each way, level, comparatively level. Much of the land grows sagebrush higher than your head; some places sagebrush comes up almost as high as a man sitting on a horse. Much of the land is very fertile and would grow such crops as grow at an altitude of 40 to 46 hundred feet. At the time of the construction of the road up Malheur Canyon, hundreds upon hundreds of homestead settlers took up claims and their deserted cabins still remain. (89.) Upon investigation, you find they had wells of water for domestic use within 16 to 25 feet almost anywhere through that section. Occasionally there would be places where they didn't strike water, but generally speaking there was water underlying that country.
50 That is why I don't class it as a desert. It was the commission's belief in preparing its complaint in order to describe one definite line that the old Harriman survey would best serve the entire State, but the Oregon commission is not particularly bound to that. If there is a better route that will serve the State of Oregon, why, the Oregon Public Service Commission is not unalterably committed to this one line. As to the consideration given the possibility of further extensions at a later date into western Oregon, it is the belief of the Oregon commission that this step is absolutely necessary, and when it is constructed that it (90) will bring everywhere further development, that the carriers themselves will seek the large tonnage that lies west of the mountains, and that it will not only cut through the Cascade Range in one place, but in time through many places.

Cross-examination:

I have lived in western Oregon a long time and have seen this fruit industry develop and attain its present proportion during that period. Through all these years that fruit has moved to eastern consuming markets to some extent. As I understand it, that is the main market for it. The crop of fruits is varied—the main crop of southern Oregon is pears and apples (91); as you come further north, prunes. The prune belt is around Roseburg, the Umpqua Valley, Lane and Douglas County, Linn, Marion and Polk, Hamhill. It is my understanding from prune growers that they don't ship to the best advantage possible because of the additional time it takes to reach the Eastern markets.

In a general way, I have investigated to determine the service maintained by the Oregon-Washington R. R. and Navigation Co. and its connections in the way of fruit service to Missouri River points and Chicago. The service is ship into Portland; ship from
51 Douglas (92) County, from Roseburg, the prunes would come into Portland, be turned over to the Union Pacific and on

through over its line. I understand that every day in the year a fruit block service on the Oregon-Washington Railroad & Navigation Company and its connections is operated through to Omaha and Chicago on practically passenger train time, expedited service. I don't know what the time is but understand you have that service. I assume it is true, as you say, that fruit is assembled at Rieth, which is the terminal near Pendleton. North of Pendleton is the fruit belt of the northern Umatilla in Oregon and Walla Walla County, Wash.

Q. And that is brought down there into that consolidation; and on to the west and north is Yakima Valley, which is the greatest producing fruit valley, perhaps, of any of them out in either of these States; that is true, isn't it?

A. Yes; I am familiar with the valley over there. And they are all concentrated over there and moved in that way. Hood River intervenes and is also taken up there. (93.)

Q. Now, how could you get that kind of service with an isolated line going across the desert areas of central Oregon to Ontario, over the Cascade Mountains, and across the desert, and then through by Malheur Canyon to Ontario?

A. I see no reason why it shouldn't be assembled at Eugene and shot straight east, in place of coming around by Portland.

Q. Oh, you are going to assemble the fruits of western Oregon at Eugene and turn it over to the cross-State line?

A. I don't know what will be done, but I say I see no reason why it couldn't be done there in place of Rieth.

Q. Well, Eugene and western Oregon would produce a comparatively small volume of this fruit tonnage as compared with that that would be available in the consolidation at Rieth, isn't that true?

52 A. Not if they had the same transportation that they have out of Yakima and that country. As to why, since they have available transportation, they don't send through the Oregon-Washington Railroad & Navigation Company, it is on account of the difference in the length of time in getting it to market. I don't know the exact mileage from Eugene to Ontario (94) via Portland and the Columbia River as compared from Eugene to Ontario via your cross-State line, but it is considerable. I understand the question of mileage isn't the only consideration. The character of service and its equipment to serve have a lot to do with it. And where those facilities can be concentrated and the transportation service to be performed can be concentrated, you can do a much better piece of work than you can where you are scattered in three or four different directions. That is what the fruit growers of western Oregon and southern Oregon are complaining of—they don't get the same service. (95.) It is true they do, if it comes through the Portland gateway. They don't claim we treat the western Oregon shipments any differently than the Yakima shipments. They claim that ship-

ping the pears from the Medford district the pears either have to come from Medford to Portland before they start east or they have to go to Roseville before they start east. Now, from Eugene, the fruit shipped from there or any other product has to come to Portland before it turns east, or it goes to Roseville and after it gets to Roseville, it isn't any closer to the market, or very little closer, than it was when it left Eugene. I don't know which way it goes from Eugene. I think the pears go through Roseville and in a manifest train from Roseville east. It is my understanding that the broccoli last year came north. (96.) The prune growers tell me prunes are
53 not shipped green. I am not familiar with the prune. I have neither raised nor shipped them. It is my understanding that they ship prunes green principally from Umatilla County, north of Pendleton, and from southern Idaho. Here in western Oregon, they evaporate them. It may be for the reason that after a few days the Oregon prune becomes afflicted with black rot; I don't know. Around Newberg, 50 miles of Portland, they produce quite a few prunes. That, and around Salem, is one of the large prune-producing districts in the State. (97.) They don't generally ship prunes green throughout the Willamette Valley.

As to the tract where the high sagebush grows, I don't know whether the Government terms it a high desert or not on its maps of central Oregon. I explored all of that territory right west of the Malheur Lake after you get up on the bench, through Wagontire. I stopped at more than a dozen cabins the last time I was over there. The old wells were still there and many filled up. (98.) That was two years ago in October.

Q. Why, do you know Mr. Olsen, the manager of the Pacific Live Stock Corporation, that owns an empire of land, the Miller & Lux interests, around the Harney country and in Grant County?

A. I am not personally acquainted with him. I know who he is.

Q. A. R. Olsen. He testified in this case previously and conducts those ranches over there. Now, on the occasion of the hearing of this previous case, in the month of March, 1924, when he was being interrogated regarding that Central Oregon country, this question was propounded to him: "And yet you drive 250 miles down to Winnemucca to ship, instead of driving to Klamath Falls, which is one of the greatest feed lots there is anywhere, isn't that true? Answer. That is quite correct, but if you would go over that country you would realize that it is absolutely impossible to drive between Crane and Klamath Falls. Question. Why? Answer. That is a
54 great high desert country and has no water; there's no feed facilities. That is a country that you can no longer trail cattle out of in the sense that you graze them as you go along. You must feed everything. There is no feed at the present time between Crane and Odell, and no (99) water." Now, is that the condition through that central Oregon country from Crane to Klamath Falls?

A. I would say that he was absolutely correct.

Q. All right, then we understand each other.

A. It is a dry country. There is no water on the surface, and there is no feed on the surface that you could feed—taking a band of beef cattle, there isn't sufficient grass that they could browse it as you go along, there's no ranch there to raise the hay to feed them, and there is no surface water.

I have never been over the survey between Crane and Crescent Lake; I have been over the wagon road across the country and across it otherwise. There is a wagon road from Bend, from Millicar across to Burns and Millican is one of the two stopping places across from Burns to Bend. (100.) There are two or three where there's people living. I wouldn't say the road skirts the margin of what we call the desert on one side or the Blue Mountains on the other. It is through the general country.

Q. Well, it is away north of this location, isn't it?

A. Well, from Burns—from Burns out for a ways—It is, nearly all the way; yes. As a matter of fact, Oregon has been spending millions and millions of dollars on highways in the last few years. I think something like a hundred million dollars. If you include the counties and road districts, she has spent over two hundred million dollars since 1917. I am talking about country contributions within the State. The State and Federal Governments have been building down the coast here on construction that will run in places
55 a (101) hundred thousand dollars a mile. As to whether during all that time they have spent enough money in central Oregon on roads and highways to maintain a decent school district, I think they have spent a fair proportion of money according to the taxable wealth in eastern Oregon, as compared with western Oregon. As to whether the taxable wealth in this entire area of central Oregon would be entirely insufficient to build this cross-State line, I would say the taxable wealth of it to-day is nil. As to what they have done in that period in the way of roads, in this particular territory there is one highway built from The Dalles to Klamath Falls, called The Dallas-California Highway. It is a gravel macadam road, oiled, a very perfect road. It is about 300 miles, the entire distance. (102.) I am not familiar with the road program but there has been a great deal of money spent east of the mountains. This particular country you speak of from Bend across to Odell, that hasn't been improved entirely. It is improved part of the way out from Bend and part of the way from Burns. It is my understanding that the State highway commission has during the last few years projected and partially built a road from Bend to Burns, but I haven't been over it.

Q. (By Mr. Spencer.) Well, that is located on the old road there that has been there for years, to the extent that it isn't high centers and a trail, isn't that true?

A. Well, I don't know just where they are putting new road, but I assume that it is somewhere near that. Half way across you can't

find it. It is the old cow trail. And when you get south of that down in this great expanse there wasn't a road the last time I was down there. (103.)

56 Q. No; there isn't in that section across the whole expanse for 120 miles a good respectable growth of sagebrush?

A. Well, I wouldn't agree with you on that.

Q. Well, isn't that true? You start 10 miles west from Burns and go down to the margin of Harney Lake, and you have got alkali flat and salt grass for twelve or fifteen miles, haven't you?

A. There is some alkali and salt grass around the lake.

Q. Yes; and the lake is practically dry?

A. But just after you get up from the lake on that plateau and take it through the Wagontire country, and if you have ever been through there, why, you get plenty of sagebrush higher than your head, and you get on a horse and ride through it you will find some high as your belt.

Q. I have been through there. Well, from the Wagontire you go in through a canyon of rock that is of volcanic formation and extremely difficult to move at all, and you encounter that condition for forty or fifty miles along this very location, don't you?

A. Well, I never was right along the location. There is some lava rock there, that is——

Comr. McManamy. Will you put on a witness to put those facts in the record there?

Mr. Spencer. I want to ask him about this high sagebrush. I want to ask him about this question that there is water (104) within twenty feet of the surface of the ground. Have you been to Lake, in Christmas Lake Valley, where the weather bureau is maintained?

A. No; I haven't been.

Q. You haven't been there?

A. No.

Q. And if the average rainfall is between six and seven inches, you wouldn't expect to find very much water, would you?

57 Not on the surface.

Q. Nor underneath, either?

Q. I wouldn't say anything about that.

My headquarters were in Butte Creek Valley, in California, but I rode the range clear over to Harney Lake. I rode the range north (105)—quartering from Lakeview over to Burns. I didn't herd any cattle across but herded some back. We picked up some cattle where Mr. Hanley's Double-O Ranch is now and we drove them back a hundred fifty or two hundred head right across the country you are speaking of. There are no cattle in there now to speak of and haven't been for a great many years, not a great many. I am speaking of south of the Double-O Ranch. It has about a thousand acres of grass land and is the only available water right in that section. (106.)

Referring to statement in regard to shipping alfalfa hay, a dairyman from Marshfield made the statement that if he could get alfalfa hay at a reasonable rate the grass land would be devoted to pasturage if they could ship in their hay. I think he will be here and you can examine him. I would say the Marshfield country, the Coos Bay country and the Tillamook country are the larger consumers of hay. It is the largest development in dairying in those two counties in western Oregon. I mean largest in the matter of intensive development. (107.) Not the largest in area but the best development. I think the largest herds of dairy cattle are in Tillamook and Coos. There are dairy herds all along the coast. As to how the production of alfalfa hay in western Oregon has progressed in the last four or five years: In a general way I know they have developed a dry-land alfalfa that is unirrigated to some extent. Whether it is a success I don't know.

Q. And they can produce alfalfa hay in western Oregon and are doing it to the extent now of some seventeen or eighteen thousand acres, more cheaply than they can raise it in eastern Oregon and ship it in?

A. Well, I don't know as to that. I don't know of any such development.

58 Q. You gentlemen cut the rates on our alfalfa hay shipments from eastern Oregon in here. Do you know, as a matter of fact, that they have produced any volume of shipments since those rates were reduced?

A. I don't know as to that. I don't know the records (108)—— I don't think that hay shipments will go very far towards sustaining a cross-State line. If they were shipping a great quantity of alfalfa hay to Coos County, the dairymen who take to shipping their hay in and using their lands for pasturage would bring in a good many loads of hay and furnish empty cars to take back. (109.) As to whether they have a great volume of hay in the Klamath Falls country to ship out: I think they are pulling their alfalfa land out of alfalfa and devoting it to potatoes. I have heard it said that they found it more profitable to raise potatoes than hay, even if there is a great demand for alfalfa hay in western Oregon. I assume that they could get alfalfa hay at Marshfield and Astoria by boat from San Francisco, if they want it. I am not sure of that.

Q. And western Oregon produces several hundred thousand tons more hay than it can consume every year, isn't that true?

A. I don't know.

Q. You don't know much about that?

A. I don't know what it produces and its consumption. (110.)

Q. (By Mr. Dey.) I suppose, Mr. Bean, we could agree that the traffic to be produced locally under the most favorable circumstances along this proposed cross-State line would never in itself justify the construction of the line?

A. No; I would agree with you on that.

Q. You would?

A. That locally within itself it probably isn't capable, under present conditions at least, to produce traffic enough to justify
59 the building of the line.

Exam. ROGERS. You wouldn't say, though, that it would never be?

A. No; I don't agree to that. I say that under present conditions. What may come in the future, I don't know.

Comr. MCMANAMY. What do you mean by "present conditions"?

Exam. ROGERS. As far as you can see now?

A. As far as I can see now, reasonably.

Comr. MCMANAMY. Will you describe what you mean by present conditions?

A. Well, the present conditions, the value of farm products, and the present conditions of that country; there is no apparent available supply of water for irrigation purposes. Therefore, under present conditions, there would be no production right now. It is essentially a stock country. (111.) There is some grass and it is capable of producing some stock. I would say the line, then, if built, must look for its support principally to what we will call the through traffic.

Q. Now, will you tell us, just briefly, what the theory of the State commission is with respect to where that traffic is coming from and how it is proposed to get it onto the cross-State line if the cross-State line were built?

A. Well, I don't know whether you want me to go into that or not. I don't know just how far you want me to go into that. Just what do you have in mind, now?

Q. Well, the through traffic upon which we are to rely to support this is to come from where?

A. It will come largely from western Oregon, western and
60 southern Oregon. Under present conditions, practically all of it originates on Southern Pacific lines. I am aware that the Southern Pacific is starting on the construction of the so-called Alturas route from Klamath Falls to Wendel. (112.)

Q. And you are relying upon this same traffic; and you, of course, are more or less familiar with the Klamath Basin case, which we tried here a year or two ago—three years ago?

A. In a general way.

Q. And it is a fact, is it not, that the Southern Pacific Co. will rely on this same through traffic to support the investment which it is now making, a very large investment, in the Alturas line?

A. Yes; naturally they will. They will naturally rely to a considerable extent on the western Oregon tonnage for that traffic; that is true.

Q. Now, your associate, Mr. Corey, testified considerably about the exchange of traffic at Crescent Lake. Do you know why it is that no mention is suggested of any exchange of traffic with the Great

Northern at the point where the cross-State line must cross the Great Northern line before it reaches Crescent Lake?

A. I don't get your question there.

Q. Well, you are familiar, of course, with the new line that the Great Northern has just finished, or two or three months ago finished, from Bend down to a station called Chemault?

A. Yes. (113.)

Q. On the Cascade line?

A. Yes.

Q. That station of Chemault is south of Crescent Lake?

A. That is correct.

Q. Therefore, your cross-State line must cross the Great Northern before it reaches the Southern Pacific?

61 A. It crosses north about 18 miles.

Q. Yes; now, is it the intention—is it expected by the complainant here that any of the traffic which the Great Northern originates in Klamath Falls, or which it originates at Bend, will be diverted to the cross-State line?

A. I will answer that as Mr. Corey answered it—we will have a witness on the stand on that question. It is our expectation that we will be able to show in this case that the tonnage from western Oregon can be delivered to whoever builds the cross-State line at a point of that junction under a joint rate that will be more advantageous to the Southern Pacific than it is now getting out of the long haul by Roseville to Ogden.

Q. How about the eleven or twelve thousand cars a year that originate at Bend? Would the same thing apply to that traffic?

A. No; I wouldn't say so. Bend is a considerable distance north, on two lines of railroad, the O. W. R. & N. and the Northern lines, manufacturing a product that is going into definite (114) markets. There probably wouldn't be the same occasion to exchange the traffic there.

Exam. ROGERS. What markets do you have in mind that there wouldn't be any occasion for exchanging traffic with the cross-State line from Bend if it is necessary from the other points?

A. Well, I was speaking of the tonnage on the western side of the mountains. It goes over the Natron cut-off, originates in Southern Pacific territory.

Exam. ROGERS. Going to where?

A. Going to Ogden, or Granger, and east. We think that

62 traffic can be exchanged at Crescent Lake, or at the connection point there with whatever line builds this cross-State line, to the advantage of the Southern Pacific and in the interest of the line, the carrier, that builds the line. Now, I don't want to go into that, I am not capable to testify on the details of that. You asked me a question. I say the commission has that in mind and will have a witness here on that question.

As to the traffic originating at Bend, I think possibly some of it might go across the cross-State line, going to Ogden. Depends somewhat on the shipper, if the shipper wanted to ship lumber into that territory. (115.)

Q. (By Mr. DEY.) How about the business handled by the Oregon Electric, which is jointly owned by the Northern Pacific and Great Northern and extends from Portland to Eugene, when you get over into the Willamette Valley, or almost at the head of the Willamette Valley at Eugene, and the Northern lines through the Oregon Electric compete very intensively now for the business of the valley? Would any of the business originated by the Oregon Electric be expected to move over the cross-State line?

A. Well, now, you say the Oregon Electric competing very closely with the Southern Pacific. Now, I don't want to answer that question with that assumption. I don't think the Oregon Electric is competing at all with the Southern Pacific, as far as any sharp competition is concerned, and it is going to have to develop, the Oregon Electric, before it gets out of the red. It isn't doing any business in the Willamette Valley; it isn't capable of doing any business. Its roadbed is not in shape to do any business. We expect it to be developed some time.

I haven't any definite information as to how much business it is doing. I know in a general way, because I travel over it once in awhile. I know the condition of its roadbed.

63 What I would like to see if you would leave it to me, would be an order of this commission to require the Southern Pacific and Union Pacific and the Northern lines to jointly build this road and operate it as a bridge. What I want is for some of you people to build that line and let Oregon develop, and I would like to have all of you join in.

Q. I am glad to have that clarified a little. I gathered the impression that there was little if any disposition to require these Northern lines to join in the construction, and there has been no intimation of taking any business away from them at their junction point, on the large amount of traffic which they originate at Klamath Falls and at Bend.

Mr. DEARMOND. May I ask a question? Mr. Bean, you stated, in answer to Mr. Dey, I think, that your proposed line would depend altogether on through traffic to justify its building.

A. On what? Through traffic?

Q. Through traffic. (117.)

A. I said materially. That is—I didn't put it that way. There wasn't enough tonnage available to this line from the territory itself to justify the expenditure of money for merely that tonnage.

Q. Now, your commission isn't committed exclusively to this one route?

A. No; we are committed to this extent, that in filing the complaint we followed the old survey of the Harriman régime.

Q. Well, suppose you shifted farther north and made your western junction at a point at Bend, and skirted the southerly part of the mountains to Burns and came westerly across the Santiam Pass, you would have local tonnage, wouldn't you?

A. Yes.

Q. An immense amount of it, isn't there? There is a large
64 amount of timber in the Blue Mountain territory?

A. Yes; by running feeder lines into the Blue Mountains and reaching that timber. I have been in Prineville and on Crooked River.

Q. Would it be possible to get across that Crooked River canyon to the line running south of Crooked River Canyon as proposed?

A. You are referring to feeder lines from the line Mr. DeArmond (118) referred to into the Blue Mountains?

Q. Yes.

A. Well, I am not sufficiently familiar with that canyon to say that.

Q. There might be some difficulty, don't you think, from your general knowledge?

A. Well, as I said a moment ago, I am not familiar enough with it to make that statement.

Q. In the country you describe as the high desert it is an entirely different country, isn't it, than contiguous to Prineville and Crooked River?

A. Well, there is considerable difference in it; yes. But this territory contiguous to Prineville is a part of this central Oregon empire mentioned in our petition.

Q. From your general knowledge, could there be a very large amount of tonnage developed in that territory from the timber and agricultural and other resources?

A. Are you referring now to a line from Seneca to Prineville?

Q. Yes.

A. On then from Prineville down across over the Santiam Pass?

Q. Yes.

A. Well, there will be considerable tonnage on that line.

65 Q. As a matter of fact, the line which you have proposed
would (119) develop the least tonnage of any possible line through that territory, would it not?

A. Within the territory itself, I would say yes.

Q. Depending on—the main idea being the through traffic from the western part of the State, the main consideration?

A. The thought of the Oregon commission was for an east and west line over the shortest possible route, and that seemed to follow on the Harriman survey, which was made years ago, and we assumed that that would be a foundation to start in this case.

Q. But should it develop that a line could be put across the Cascade Mountains further north to that territory, that that would be feasible, then would it be, considering the local territory across east

of the mountains, much better to go further north, where there would be local tonnage possibly developed?

A. If it should be found that that would better serve Oregon, the public service commission will say amen to it.

Q. And isn't it a fact that some tonnage would be found further north? In fact, a very great deal north?

A. Yes; I am inclined to think there would be more tonnage directly tributary to the line.

Mr. DUNCAN. On that point, Mr. Bean, what effect would such (120) a line have upon through traffic originating in Malheur County, in southern Idaho, destined for northern California markets?

A. Well, it would lengthen the route quite considerably. I don't know the exact distance.

Q. And it wouldn't be as feasible for shippers at that point to ship across the line that you have described from Seneca to Prineville and then south to California as it would across the line that we asked for?

66 A. It would be more circuitous along there. As to whether it would be shorter from those point to Portland by way of Prineville, I haven't checked the map to see. Not much difference, possibly a little shorter.

As to whether it would be an advantage to route traffic more directly to Portland, being the chief port or seaport of the State: The Public service commission represents the entire State, and in framing our complaint, we framed it to what we thought would be the best interests of the State as a whole. (121.)

Q. Would that be to the best interests, to divert traffic to California?

A. The line that—according to the complaint, you mean?

Q. Yes.

A. I am inclined to think it would. It would be the shorter route. I don't know to what extent the shippers route their own traffic. As to why prunes and strawberries can't be shipped to Chicago, I only know what I get from the fruit grower, that the distance, the time consumed; that the prunes don't reach the market in marketable condition. I don't know what period of time they will carry and reach the market in proper condition. (122.) Some of the prune growers claim that if they had the direct route east they could compete with southern Idaho and Yakima Valley and those places in shipping their prunes green into the eastern markets, but I don't know as to the facts.

I don't know what sort of a schedule they are anticipating to make. Shortage of distance, I understand—I don't know the exact distance. The maps will show. Some 400 odd miles closer to Granger

66½ from Eugene than by way of Roseville, but I haven't checked those figures myself.

Exam. ROGERS. What I have in mind, Mr. Bean, that if the present schedule, you say, is seven days, and this four hundred miles would cut off one day, leaving six, and prunes wouldn't carry over five——

A. It wouldn' help them any.

Exam. ROGERS. It wouldn't cure that situation?

A. No.

Exam. ROGERS. Do you think this so-called desert area has sufficient water underlying it to support agricultural development without irrigation?

A. I wouldn't say as a whole, no. There are spots on it, there's places on it, that, depending, of course, on the underflow of the water, if the water is sufficient to stand pumping, there's many thousands of acres of very fertile land (123) that if you had water to put on it that would grow anything that would grow in that altitude.

Exam. ROGERS. Yes; but can you answer the question as to whether there is sufficient water there to support agricultural development?

A. No, no; I can't answer that question. I know there is water along the northern boundaries where the settlers went in the early days, settled; there's cabins scattered there for miles and miles and miles, deserted cabins—all of them had well water—I say all of them; practically all of them. I have visited some of those, and the water you can see in them yet, and some of them have caved in, and the water, I would say, would run within sixteen to forty feet.

Exam. ROGERS. Well does the presence of these old wells indicate a present supply of water?

67 A. For domestic purposes. I don't know how they would stand pumping at all, but the farmers or homesteaders did live there and had water to water their cow and their horse and for their own consumption.

Exam. ROGERS. I didn't quite understand your answer to Mr. Day on the traffic that this cross-State line would enjoy, that is, whether it would ever have enough traffic originating on the line to support the line?

A. Why, that is impossible to answer what the future will bring forth. It is a country that isn't going to develop (124) any great amount of tonnage from agriculture. What there might be there in mining and other matters I don't know, but it isn't an agricultural country. It is a high plateau, 4,000 to 4,500 feet elevation, grows some grass on the foothills, the little hills scattered in, grows bunch grass that would produce some stock.

Exam. ROGERS. Well, is it the agricultural development, or the mines that the territory may hold, or what is it in the way of local traffic that you attribute to the support of this cross-State line?

A. At the present time there is practically nothing. Now, what may develop in the future—I think there would be some stock—I don't know—depends very much on whether there is water underneath that will stand pumping and whether cheap power can be

had to pump it as to whether it will produce any agricultural products to ship out.

Exam. ROGERS. That is the way I understood it awhile ago, Mr. Bean, and it raised this question in my own mind, that I have heard it said, I heard it somewhere, that there was some thirty-three thousand square miles in this territory, or one-third of the area
67½ of the State, that wa swithout a rail line, and, as I got it, considerable importance was being attached to that, and I am wondering now, if there is nothing in sight in this territory to support a rail line, even if put in there, how any point can be made of the fact that there is this vast area without rail transportation? (125.)

A. Well, it will never develop without rail transportation, that's a sure thing.

Exam. ROGERS. But I just understood you to say that it wouldn't develop with it because there wasn't anything there to develop.

A. Well, I didn't mean to say that, if I did: I didn't mean to give you that impression. Much of that land is capable of development. Now, there is much of it I can't see at the present time that it can ever be developed.

Exam. ROGERS. Now, what proportion of this thirty-three thousand square miles that has been talked of would you say would never probably be developed—barring, of course, the——

A. Well, that statement takes into consideration the country into Burns, those big stock ranches of Burns, irrigated areas in that territory, and skirting the foothills of the Blue Mountains and extending to Silver Lake, Chewaucan, Summer Lake, where there is some substantial settlement now. I was testifying to the heart of that, probably seventy-five miles square, or a little larger.

Exam. ROGERS. An area 75 miles square would be about 5,600 square miles out of the 33,000; is that your thought?

68 A. I don't know how it would figure up, but I was (126) testifying to that center in there, not taking in that whole territory. That thirty-three thousand square miles covers that entire country running to Silver Lake, Lakeview, and all of those places, that are now fairly developed.

Exam. ROGERS. Your thought as to the territory that would not probably ever be supporting was confined to this area seventy-five miles each way?

A. Yes; that is the center of it, through which this road runs directly.

Exam. ROGERS. That is all.

Comr. MCMANAMY. That area of thirty-three thousand square miles, then, contains a great deal of land which is not only at present producing traffic, but which will in the future produce——

A. A great deal more.

Comr. MCMANAMY. A great deal more traffic?

A. That is correct.

Comr. McMANAMY. About those deserted homesteads in this section of the country, do you know the cause?

A. Only from talking with the old-timers over there.

Comr. McMANAMY. Well, what I am trying to find out, is it due to lack of transportation, or lack of water, or——

A. Due to lack of transportation. They went in there (127) at the time the road was being built from Ontario Junction to Crane—people thought the road was going to be built across the country, started in on that ground, and they followed that road there
68½ and they took up homesteads all over that section, wherever it looked like there was development for a home, and they stayed there until a time when road construction stopped, and everything stopped, and it is deserted and gone. I don't know what——

Comr. McMANAMY. Do conditions differ in that particular along the part of the line that was completed? That is, have those homesteads developed there and are producing traffic?

A. These homesteads that I refer to are in that territory west—a little south and west of Burns, through the Wagontire section, and extending out seventy-five, eighty miles from Burns. Now, that country, there is—there is no railroad in there. There was no place between Harriman, or Crane, in the Malheur Canyon for a homestead after that left the valley, Ontario, north to a canyon; the road is built right up a canyon all the way, from an elevation of two hundred feet to four thousand feet, and stopped. From there on west is where this settlement is—where this settlement was.

Comr. McMANAMY. This high desert, so-called, is a comparatively level plain? (128.)

A. Comparatively level; yes.

Comr. McMANAMY. There are no valleys or streams in it?

A. No; no streams, or no fertile valleys. It is a dry, arid country.

Comr. McMANAMY. I think that is all, Mr. Bean. Thank you.

Mr. SPENCER. May I ask Mr. Bean another question, please?

Comr. McMANAMY. You may.

69 Mr. SPENCER. I am anxious to know where this thirty-three thousand square miles is located, this great empire that isn't served with rail connection. Now, I assume that it would be fair to figure that fifteen miles on either side of the railroad would be the country that would be tributary to the railroad; would that be about right?

A. Oh, no; I wouldn't limit it to fifteen miles.

Q. Well, put it twenty.

A. You take the territory north of this line to the foothills of the Blue Mountains, there is a territory that can be developed——

Q. Well——

A. And it is tributary to this country.

Comr. McMANAMY. Well, Mr. Bean, along that same line, isn't Harney County, Oregon, tributary to Winnemucca, Nevada?

A. Well, the nearest railroad, in a sense, yes. (129.)

Comr. McMANAMY. The nearest railroad—they drive stock down there, don't they?

A. Yes; in a sense.

Mr. SPENCER. No; the present Burns branch of the Oregon-Washington Railroad & Navigation Company runs right through the Harney Valley, doesn't it?

A. Yes.

Q. To Burns?

A. Yes.

Mr. ELLIS. Runs through and stops.

Mr. SPENCER. Well, it doesn't now.

A. That is true now, but this country is all, you might say, tributary to Burns, and they can drive their stock to Burns, but that doesn't settle——

69½ Exam. ROGERS. Mr. Spencer, that figure of thirty-three thousand was my figure—was that right?

Mr. SPENCER. Yes; that has been the statement all the time. But I want to get this thirty-three thousand. Now, if you are going to have—by settlement you mean—what do you mean? You are going to settle and build this country, now, you are going to build this location across, now, from Harriman to Crescent Lake, 185 miles—now, what kind of settlements are you going to put on there, and what are you going to raise?

A. Mr. Spencer, that isn't from me. I don't know. I know there is land in there of soil that is capable of producing any crops that will be raised in an altitude of forty-five hundred feet. (130–131.)

Q. If you can get water on it.

A. If you can get water on it. And I know there are places in there where the water is within 16 to 40 feet of the surface. Now, what amount of water there is in there, whether it will stand pumping or not, I don't know. If there is water there that will stand pumping it is capable of raising a good bit of alfalfa and other crops. It depends on the future.

Q. Are you proposing here the proposition that a railroad is to be built to induce people to go in there and try to raise alfalfa at the nozzle of a pump?

A. No; I am not advocating that at all. I am saying that if a road is built in there that there will be much of it that will be settled, and if they have water underneath it will be developed and grow crops.

70 Exam. ROGERS. To what extent will the development depend on whether there is sufficient water there to stand pumping or not?

A. Well, it will develop almost entirely on that. I know of no way, can see no way, where they can get water for—surface water for irrigation, by storage or otherwise. There may be. I don't know what that is. (132.)

Mr. SPENCER. Now, getting back to the original inquiry, I want to know what area is comprised in this 33,000 square miles. I want to assume that you can serve a district 15 miles either side of a railroad, or you can make it 20, if you want to—that would be 40 miles in that belt through the State for a distance of 185 miles. That would be, say, somewhere between 5,500 square miles and 6,500 square miles. Now, where is the balance of it?

A. I don't know where the boundary of the 33,000 square miles is. I didn't bound it. I didn't know anything about that. I have seen that used, and the examiner mentioned that a moment ago; but I say that it must include Summer Lake, Christmas Lake, Cycan, and Chewaucan, and Lakeview, that entire country there.

Exam. ROGERS. As I count that, that would be an area about 185 miles square——

Mr. SPENCER. I didn't get that statement, sir.

Exam. ROGERS. I say, that would be about 182 miles square to make up 33,000 square miles.

Mr. ELLIS. The 33,000 square miles figure was used before the construction of the line from Bend south to Klamath Falls. It includes the area west of the terminus of this line. (133.)

71 Mr. SPENCER. Well, even so——

Mr. DEY. Have you got a witness to come on later who will tell us just where the 33,000 square miles was, or is?

Mr. ELLIS. I don't know as we will have anything to say about the 33,000 square miles in this case.

Mr. SPENCER. All right.

Mr. ELLIS. That was the last case, Mr. Spencer, where we used that. It is somewhat different now.

Mr. DEY. There is some contraction since that.

Comr. MCMANAMY. You will find that 33,000 square miles on page 13 of 111 I. C. C., in the commission's former report.

Mr. SPENCER. It went on the shelf, I think, Mr. Commissioner. (134.)

WILLIAM L. TEUTSCH was thereupon produced as a witness on behalf of complainants and, having been duly sworn, testified as follows:

Direct examination:

I reside at Corvallis, Oregon; my occupation is Assistant State Leader of County Agricultural Agents, representing the Oregon Agricultural College and the United States Department of Agriculture.

72 I have been in agricultural work in Oregon for seven years, three years as a county agent in Lake County, south-central Oregon, two years as a district agent in western Oregon, and approximately two years in my present position as assistant county agent leader for the State. I was reared on a farm in eastern Oregon, spent all but five years of my life in Oregon, and attended the Ore-

gon Agricultural College and graduated from that institution. Immediately upon graduating I went to Lake County, as county agricultural agent. (135.) I appeared and testified on behalf of Lake County in the previous hearing in the railroad construction case. At that time I made an extensive survey of the agricultural and other possibilities of Lake County. At the request of the Oregon Public Service Commission I have made a complete agricultural survey of the State of Oregon for the purpose of this investigation, that is, of the counties which we deemed would be benefited by the construction of this proposed railroad. I personally visited each of the counties and while in those counties I took up with various local people, commodities which those counties produced, the markets to which they went to a degree; then after doing that I drew upon the personal sources of information such as the census reports of the Bureau of Crop Estimates, reports of the Oregon State engineer and so forth, and compiled the data which is in this exhibit.

Prior to undertaking this special study my duties as assistant county agent leader for the State took me into the various counties of Oregon and brought me into direct contact with agricultural interests and the needs of agriculture. Probably that is why the public service commission (136) asked me to collect this data because as assistant county agent leader, carrying on work of an administrative nature with the 27 Oregon county agents, I visited each of
73 these 27 counties sometimes two, sometimes three or four times a year. Of course, in the conduct of my work we meet with the local people and develop a program of agricultural development work for the particular counties in which we have county agents. That enables us to know something about the agriculture in each of these counties. The 27 counties do not cover the entire State; there are several without county agents.

I have prepared in exhibit form the results of my studies.

(Thereupon said document was offered and received in evidence marked "Exhibit No. 1, Witness Teutsch.")

I will briefly describe what I was undertaking to do in compiling this (137) report and how it was compiled. As I said I visited each of these counties which we feel would be benefited by the construction of a cross-State line. The counties which we deemed would be benefited were in western Oregon, Linn, Benton, Lincoln, Lane, Coos, Douglas, Josephine and Jackson; in eastern Oregon, Malheur, Harney, Lake, Deschutes, Crook, Jefferson, Wheeler, Grant, Baker, and Klamath. In this data no attempt has been made to list all the agricultural tonnage which originates annually in the various counties, consideration being given only to those commodities which will move east or west via the proposed cross-State line and the quantity of movement. The agricultural tonnage considered in this statement in most instances involves 50 per cent or less of the annual shipments in the various counties under consideration. Wherever possible, official records were used, such as data contained in the

U. S. Agricultural Census for 1925, Bureau of Crops and Livestock Estimates, U. S. Bureau of Agricultural Economics, U. S. Reclamation Service reports and reports of the Oregon State Engineer, and where these did not apply local sources were drawn on.

73½ Following is a detailed list of the sources of information: Data relating to area, agricultural wealth, number of farms, acres of orchards and crops, all taken from the 1925 (138) U. S. Agricultural Census. Car lot exports of fresh and dried fruits taken from the records complied by the Bureau of Agricultural Economics, U. S. Department of Agriculture; the destination of products determined from dealers' shipping records, U. S. Bureau of Economics data, and from shippers; numbers of livestock are figures given by the U. S. Bureau of Livestock and Crop Estimates, U. S. Department of Agriculture for 1926; the yields given

74 are averages recognized in the various counties and are conservative. The data on irrigation and irrigated areas were taken from the official Government and State reports. No attempt has been made in these data, because of the inadequacy of information, to estimate the incoming tonnage utilized on farms in the territory, of such commodities as spray materials, farm machinery, fertilizers, and the like, which might move via this proposed cross-State line.

Now in page 1, concerning Malheur County: Malheur County is the second largest county in Oregon; it has an area of 6,325,120 acres, of which 7.7 per cent, or 484,820 acres, is in farms. The valuation of the entire agricultural industry is $19,627,804, owned or operated by 1,331 farmers. There are in the county 368,600 sheep and 39,040 beef cattle (139), and it is from these two sources the county derives its major income. Alfalfa and other hay is produced on approximately 50 per cent of the irrigable land, and wheat also brings substantial income. Both dairying and poultry raising has seen rapid expansion since 1920. The county has 4,745 dairy cows and doubled its production of dairy products between 1920 and 1925. Other crops exported include apples, prunes, clover seed, alfalfa seed, potatoes, lettuce and onions.

In climate and productive power the Snake, Owyhee, and Malheur River valleys are similar to the Yakima Valley in Washington and rank with the most productive districts in the Northwest. Records of the Oregon State engineer show a total irrigated area of 118,807 acres in the county irrigated by various means—pumps, gravity projects, and from natural run-off.

Now the estimate of the present agricultural tonnage available for movement over the proposed cross-State railroad westbound is listed on page 1. We arrive at these figures in this way: There are 368,000 sheep in Malheur County, from which there is an

75 annual turnover of 50 per cent. Thus 184,300 sheep are marketed annually. Practically all of these are lambs and

now move to Eastern markets. Approximately 25 per cent of these would move to California as fat lambs, or 46,075, in case the cross-State line were built, making a tonnage of 1,843, or 184 cars, as you see there. (140.)

Now then, for cattle there are 39,040 cattle in Malheur County, of which 22 per cent are marketed annually, or 8,588, all of which would go over the proposed line to California, or Northwest markets, giving 4,723 tons cattle, 378 cars.

There are 7,705 hogs in the county. The annual turnover is 128 per cent. Thus, 7,862 are shipped out annually after deducting local requirements, or 776 tons, 79 cars.

From butter: The Farmers' Cooperative Creamery, located at Payette, handles six-sevenths of the butterfat produced in the county and report purchasing 800,000 pounds of butterfat in 1927. This would make 944,000 pounds of butter, all of which goes to California, or 472 tons, 31 cars.

From horses: There are 16,570. 28 carloads on an average are shipped west annually, 398 tons, or 28 cars.

From wheat: 7,566 acres of wheat, which produced for export in 1927—227 cars, making 9,410 tons or 227 cars.

From dressed poultry: The Farmers' Cooperative Creamery shipped 8 cars of dressed poultry to California in 1927, 25% of which originated in Malheur County, making 30 tons, or 2 carloads.

There are 2,134 acres of bearing apple trees in Malheur County. About 50 per cent of the production is shipped from Idaho points across the Snake River. Average carloads shipped for three years is 552, of which, if the cross-State (141) line was constructed, 25 per cent would go to California, 2,346 tons, 138 cars.

76 From potatoes: During the past four years the county has produced an exportable surplus of potatoes ranging from 140 carloads to 441 carloads, with an average of 234 carloads. With a cross-State line the estimate is 75 per cent would go to California and other southern markets, making a total of 3,132 tons, 174 cars.

The total present tonnage, 23,050, 1,241 cars.

Next on that page you see irrigated lands in Malheur County listed, taken from the report of the Oregon State engineer, in a total irrigated area at present of 118,807 acres.

On the same page you find a list of the new projects now under process of construction, or constructed and under development. The Owyhee project now under construction by the Federal Reclamation Service consists of 158,567 acres, of which 117,851 acres is pronounced as good irrigable land. The estimated cost is $17,404,000. In addition to irrigating new land this project will supply supplemental water to 31,366 acres of land in Malheur County and 27,234 acres adjacent in Idaho now inadequately supplied, thus increasing its productiveness. Of the 80,900 acres of the new land to be irrigated by the project approximately 56, 400 acres of it lies in Malheur

County, contiguous to the areas now irrigated, the balance of 24,500 lies adjacent in Idaho, near (142) Homedale, making a total of new land to be brought under irrigation of 80,960 acres.

The Vale project, now under construction, comprises 28,350 acres adjacent to the low valley lands along the Malheur River near Vale. Of the total acres 3,570 is now inadequately irrigated and supplemental water will be provided. The net area of new land to be irrigated is 24,780 acres. The estimated cost of the project is $3,587,305. Thus, within the next few years the Federal Government will expend on irrigation projects in Malheur County
77 $20,991,305. Now these projects will be devoted to the production of products largely needed in increasing quantities on the Pacific coast, such as butter, cheese, dressed poultry, lamb, beef, pork, and similar commodities.

Additional areas which are in the process of development include the Jordan Valley project—the balance to be watered is 9,500 acres; the Warm Springs project—balance to be watered, 4,000 acres; and the Westfall project—the balance to be watered, you see ,on page 2, 4,050 acres; making the total new lands to be irrigated in Malheur County, 123,290 acres, or an increase of more than 100 per cent.

Now then, in addition, the Owyhee project displaces pumping units on 19,366 acres in the county, and on the 27,234 acres in the Gem district of Idaho, which receives inadequate water, and will supplement water supply on 12,000 (143) acres under the old Owyhee project. Thus, production will be increased, due to better water supply, by 25 per cent on 58,600 acres.

Now these data, as we indicate, were taken from the report of the Bureau of Reclamation by Dr. Elwood Mead, 1925, and from the report of the Oregon State engineer, 1924 and 1926.

Next is an estimated utilization of the land to be irrigated. Now we have based this utilization on our personal knowledge of the territory, having been reared in Malheur County, the type of agriculture that will be establised on the projects which are now being developed. We based all of our tonnage estimates on the utilization of the land according to this table on page 2.

Now, then, as to the tonnage which the development of these projects will make available, 26,312 cars of alfalfa, producing at the rate of 5 tons per acre, and 8,096 acres of clover at 2 tons
78 per acre, produce 147,750 tons. Deducting the ranch requirements for dairy cows on each 80 acres and for horses and other livestock of 46,552 tons, there would remain 101,200 tons of alfalfa and clover with which to fatten steers and lambs. Estimating that 50 per cent of this hay will be fed to cattle and 50 per cent to sheep, 50,000 (144) tons feed for beef cattle, which gain on an average 60 pounds per ton, produce 1,518 tons, or 121 carloads. The same amount of alfalfa and clover fed to lambs, which gain

about 22 pounds per head in ninety days when fed barley with alfalfa, would produce 2,922 tons, or 292 cars.

From corn fed to hogs, figuring that 80 acres would fatten out 30 hogs annually to 200 pounds, corn from 6,072 acres at 50 bushels would produce 3,000 tons, or 300 carloads of hogs.

Butter produced by dairy cows: Figuring that each 80 acres will run 10 cows, will be 10,120 cows on the project, producing annually 250 pounds of butterfat, all of which would go to California, as it does now, giving 1,475 tons or 98 cars.

From potatoes, 4,048 acres at 125 sacks per acre, figuring 50 per cent moving west via the proposed route would give 12,600 tons or 700 cars.

From wheat grown on 16,192 acres at 40 bushels per acre, deducting the farm seed and feed requirements of 100 bushels per 80 acres would give you 16,192 tons, or 390 cars; making a total from the new land to be brought under cultivation on the Owyhee project of 37,707 tons, or 1,901 cars.

Now a more adequate supply of water for 46,000 acres of land now being supplied by pumps and more water for the 12,000 acres under the old Owyhee ditch, would increase the present estimated tonnage for westbound shipment by 25 per cent (145) of the following commodities: You see that listed under 2, page 2, including sheep,
79 hogs, butter, wheat, and potatoes, making a total from additional water on old lands of 3,909 tons, 172 cars, making a grand total as a result of the construction of the Owyhee project of 41,616 tons or 2,073 cars, per annum.

The totals given are totals to move over the cross-State line and not total production from the project. I figured the percentage which we estimated would move west, not considering what would move over other routes.

Mr. SPENCER. If I may interrupt there, that is a different statement than the one made to you by Mr. Ellis. You say it is to move west; do you figure everything is to move west via this cross-State line?

A. The figures which I have given here are given as traffic which will move over this cross-State line.

Mr. SPENCER. Or would move west, which?

A. That will move west via the cross-State line.

Mr. ELLIS. And does not include the total tonnage to be produced. You understand that?

Mr. SPENCER. I understand that, but why he states it will go west via the cross-State line is what I don't understand (146).

All the yields given are those given by the Reclamation Bureau in the Mead report of 1925, except for alfalfa. The bureau used the yield of 4.5 tons per acre, which I know is exceptionally low, and I have used here 5 tons per acre in this statement.

Now the plans provide for the completion of the Owyhee project within five years, and the tonnage should be available as follows:

20 per cent the first year, 15 per cent the second, 15 per cent the third, with a 10 per cent annual increase thereafter until the project
80 is under cultivation. There will be no tonnage—that is, there is not likely to be any tonnage from the Owyhee project within five years.

Now from the Vale Project, we made an estimated utilization of the land on that project also, which you find under 3, on page 3, and on that basis we computed the tonnage which will result from the construction and placing under cultivation of this project hay grown on 8,053 acres at 4½ tons per acre would produce 36,240 tons, less the ranch requirements of 46 tons for each 80 acres to keep 10 cows and other livestock, which leaves a surplus of 22,026 tons. Feeding these 11,000 or half of this 11,013 tons to steers, which gain 60 pounds per ton, you would have 330 tons, or 26 cars. From sheep you would get 11,000—from alfalfa, rather, figuring on shipping the surplus of alfalfa, or half the surplus of alfalfa to western Oregon and to coast counties, 11,013 tons, or 734 cars (147).

From corn grown on 1,858.5 acres, yielding 45 bushels per acre, you would get 83,632 bushels, which is sufficient to fatten, along with some barley, not otherwise figured, 9,270 hogs at 200 pounds, figuring 30 to each 80 acres, gives you 977 tons, or 98 cars.

From potatoes, 1,239 acres, a yield of 112 sacks per acre will give you 6,938 tons, 375 cars.

I skipped butter. Taking the production of dairy cows at 250 pounds per acre you would have 457 tons of butter, or 30 cars.

From wheat, 4,956 acres at 35 bushels will give you 4,647 tons or 112 cars; making a total from the Vale project of 24,362 tons or 1,375 cars.

The Vale project is now under construction and plans provide for its completion within the next three years. Within five years 30 per cent of the tonnage estimated should be available, 15 per cent additional the following year, 10 per cent per year additional thereafter until the project is under cultivation.

81 From the Jordan Valley irrigation project, which has 9,500 acres yet to be irrigated, on a livestock basis primarily because of its distance from shipping point, it should produce 250 pounds of pork, beef or mutton per acre. Figuring land utilization on this basis you would get 593 tons of cattle, 48 cars, 594 tons of sheep or 60 cars, making a total from (148) the Jordan Valley project of 1,187 tons, 108 cars.

On the Warm Springs project there are 4,000 acres yet to be brought under irrigation, a total of 17,000 acres in the project. Figuring 2,000 acres of wheat at 35 bushels will give you 2,100 tons, or 50 cars; 2,000 acres of barley at 50 bushels, 2,400 tons, or 80 cars; making a total from the Warm Springs project of 4,500 tons, or 130 cars.

As to whether any progress is being made in completing the Warm Springs and Jordan Valley projects: There is progress being made

on both. On the Jordan Valley project people are getting in better condition each year and more of the land is being brought under cultivation. On the Warm Springs project, the area of it is being cut down, practically all the poor land has been eliminated, the project reduced to 17,000 acres, of which there is 4,000 of reasonably good land still to be brought under cultivation.

Now from the Westfall project, figuring utilization as given in the table, page 4, under paragraph 6, we have 150 tons from hogs, 15 acres; alfalfa, 3,014 tons, 200 cars; butter, 147 tons, 10 cars; wheat, 912 tons or 22 cars; making a total of 4,223 tons, or 247 cars.

The Westfall project consists of good land and has been (149) pronounced feasible by the State engineers, and will no doubt be developed if immediate transportation and markets are provided. There is 1,800 acres which are now watered by the natural run-off.

82 The project proposes to irrigate 4,050 acres additional as a result of storage of water.

Now 40 per cent of the total tonnage from the Jordan Valley project, the Warm Springs and the Westfall projects should be available within five years, the balance becoming available whenever the Westfall project is constructed. This gives a total tonnage value for the cross-State road, as listed on page 4, figuring present tonnage at 23,050, 1,241 cars; additional available within five years 11,531 tons, or 659 cars; making a total within five years of 34,581 tons or 1,900 cars additional potential tonnage within the next few years, that is the tonnage which will develop from the putting under cultivation of the Owyhee, the Vale project, the completion of the Jordan Valley project or putting under cultivation the balance of the land in Jordan Valley, the Warm Springs and the Westfall projects, the bulk of it will come from the Vale and the Owyhee projects, which are now under construction. (150.) By the "next few years" I mean the Owyhee project will begin to come into production as soon as it is completed, which we estimate will be five years, and thereafter my estimates on that are that 20 per cent will come in the first year, 15 per cent the next, 15 per cent the third, the 10 per cent annual increase thereafter until the project is completed.

Now the Vale, which is now under construction and will be completed within three years, we expect 30 per cent of the tonnage to be available within five years, 15 per cent additional the following year, and 10 per cent thereafter. So that the bulk of this tonnage will be available within a few years—within a comparatively few years.

83 Not all of these projects are Federal projects but the two largest are, the Owyhee and the Vale, comprising by far the greater percentage of the acreage here listed. The Jordan Valley and the Warm Springs and the Westfall were proposed as State projects and are under the State irrigation law.

Q. Will you complete the statement of the summary of tonnage?

A. It gives a total additional tonnage within the next few years of 64,357, or 3,274 cars, making a total tonnage, including present, that are available within five years and that will be ultimately available of 98,938 tons, or 5,174 cars, from Malheur County. (151.) Of the total of 5,174 cars, 1,241 cars would be now moving. That is the present tonnage, moving via some other route. That would be diverted to the cross-State line. Now, the conservativeness of these potential tonnage estimates is apparent, as the estimates are based on the utilization of 72 per cent of the new irrigated lands in the production of crops to be fed dairy cattle and livestock, thus getting those products into the most concentrated form possible.

Now, I might say that in case there were natural expansion of crops, such as potatoes, onions, apples, and wheat, which are grown in considerable quantity in this territory, these figures of course would be greatly increased. As an example of that, at Harper, where there is some settlement going on at present, 3,000 acres of old meadowland was subdivided and 31 new families are farming in that area, and they expect to ship this year 50 carloads of wheat (152), representing an increase of several hundred per cent.

84 That is just an example of the development that could alter these figures that I have prepared and increase the tonnage.

The Owyhee projects extend from a point west of Ontario and four or five miles north, south, a point west of Nyssa, on out to Homedale, and extends over into the Gem district of Idaho. The Vale project is located west of Vale, near Vale, in Malheur County. The Warm Springs project is located in the vicinity of Vale, extending towards Ontario. The Jordan Valley project is located in the Jordan Valley. I think it is about 125 miles southeast, or southwest of Ontario. And the Westfall project is located say about 50 miles, I am not sure about those distances—west of Vale.

Ontario, the elevation, as I recall, is about 2,100 feet; the Owyhee project, the bulk of it is about 2,250, I would say—2,250 feet elevation; the Vale project, the elevation increases slightly; Jordan Valley, about 2,800, if I remember correctly; and the Westfall some place around 3,000. But the two important projects, the Owyhee and the Vale, are low elevation projects, with climatic conditions similar to those (153) which prevail in the Yakima Valley, production about the same. The areas described are particularly suited for the production of the commodities listed in my statement. A study of the consuming markets at present, and the immediate facilities reaching those markets as a result of the construction of this line has guided me in determining the direction of movement and ultimate market of these commodities.

Harney County is located in south central Oregon. It is the largest county in the State, has a land area of approximately 6,357,000 acres, this being nearly as large as the State of Maryland, and larger than Massachusetts and Rhode Island combined. There are

in the county 185,730 sheep and 59,620 cattle, according to
85 the U. S. Bureau of Livestock and Crops Estimates. This is about one-half the normal cattle population of the county, but represents about the normal number of sheep run. Practically the only source of income for this district at the present is from livestock—cattle (154), sheep, a few hogs, and horses, which utilize the ranges and fenced pastures during the summer months, and they are fed on the native hay produced on several hundred thousand acres of meadow land during the winter. There is invested in the agricultural industry in the county $15,760,176, which is owned or operated by 681 ranchers and stock men. The total area irrigated during the flood season when maximum run-off is obtained is 238,603 acres. The average elevation of the producing areas in the county ranges from 4,100 to 4,300 feet and climatic conditions are very similar to those prevailing in the Klamath Basin, in Deschutes and Crook Counties, and in the Goose Lake Valley of Lake County, all of which are sections where intensified irrigation farming has proved successful.

Now the irrigable lands in Harney County you will find listed on page 5. These are principally taken from a report of the Oregon State engineer, and some of the acreage was obtained from local residents, which was not given in the report of the State engineer. The Blitzen River and tributaries are not included in the State engineer's report. Waters from the east slope of Steins Mountains are not included in that report.

Now the agricultural tonnage available at present in Harney County:

There are 185,730 sheep, of which there is an annual turnover of 50 per cent, thus making available for market (155) 92,865. While all of the lambs now move east, approximately 25 per cent would move to California as fat lambs via the proposed line. This
86 would give a tonnage of 870 or 93 cars.

With reference to the approximate market to which these various commodities would move: So far as preparation of this data is concerned, there is no question but what all of this livestock would go to Crescent, across this line. Then the stockman will have his choice of two southern markets, San Francisco or Los Angeles, or he can go to Portland or Seattle, without materially increasing his distance.

I have omitted everything that would move east—for instance, in the figure I just gave you I am only using 25 per cent of the lamb crop of Harney County as moving west, 75 per cent of it we are figuring is going to go the way it now goes. Now for cattle, there are 59,620 cattle with an annual turnover of 22 per cent, 13,116 will be (156) marketed annually providing 5,902 tons, or 473 cars.

From hogs, there are 2,340, of which there is an annual turnover of 128 per cent, which gives 269 tons, or 27 cars that would be marketed annually.

Wheat—since the railroad reached Burns in 1925 the production of wheat has increased each year, and a 50 per cent increase is expected this year; tonnage to be available from wheat 1,530, or 37 cars.

Horses—13,850 horses, approximately 20 carloads are shipped out annually, 230 tons or twenty cars; making a total present tonnage in Harney County of 8,801, or 650 carloads. The 650 is just the amount that would move over the cross-State line. Now as to the potential tonnage for a cross-State line as a result of the development in Harney County from the division of large holdings which now have adequate irrigation works, there would be considerable tonnage accrue. There are five companies, the Eastern Oregon
87 Livestock Company, the Pacific Livestock Company, the Oregon Western Colonization Company, the William Hanley Company, and the Harney Valley Improvement Company, which own 490,206 acres in Harney County. I was informed that these holdings are being offered for sale, and on some of them definite effort is being made to obtain (157) settlers. While a few settlers have been obtained for small holdings, serious difficulty is being experienced because of the distance from markets due to the circuitous route over which products must go, virtually eliminating a choice of markets. Through such division of holdings resulting in better and more intensified agriculture there are 80,000 acres now largely producing native hay, half of which can be made to sustain the normal livestock population, thus releasing 40,000 acres for other purposes. The area capable of such development with existing irrigation works lies in the Blitzen River Valley.

A reasonable utilization of this land, based on the present production of similar districts, would be as follows: 50 per cent to alfalfa, 10 per cent to pasture, 15 per cent to wheat, barley 20 per cent, and buildings 5 per cent.

On that basis we have computed the tonnage from this area, the development of this area, 40,000 acres, on page 6, the first table, giving it for cattle, sheep, hogs, barley, and oats, and wheat, a total of 9,252 tons, or 362 cars.

This suggested land available for subdivision is about 30 miles, as I recall, southwest of Crane and the proposed route given in the complaint would come within about six miles of this particular area. (158.) Probably the furtherest point in the 40,000
88 acres would be 12 or 15 miles from the railroad. In the main this land lies south of Malheur Lake. From the projects requiring construction of irrigation works pronounced feasible by U. S. Reclamation Engineers, there is also possibility for developing potential tonnage. The report of John T. Whistler, engineer for the U. S. Reclamation Service, and John H. Lewis, Oregon State engineer, made in 1916, after a careful survey, pronounced feasible the storage of the waters of the Silvies River and its tributaries through the construction of dams, thus controlling water on 60,000

acres of wild meadow now irrigated from flood waters and providing water for 40,000 acres additional sagebrush land. We have reduced, for conservativeness, the proposed sagebrush area to be irrigated from 40,000 to 30,000 acres, figuring that such development would double the production of the present meadow land, thus releasing 30,000 acres of it for other purposes, making a total of 60,000 additional acres in the Harney Valley to be brought under or subject to development. With the same basic utilization of land contemplated for the Blitzen development, and on the basis of similar yields, the potential tonnage from this development would be as given under paragraph 2–A, Harney project, making the total tons of 12,355 cattle, sheep, hogs, barley, and oats, and (159) wheat, or 479 cars. Now as to just when such development will start and the time required for its completion can not now be forecast. Serious consideration has been given such development in the past and an irrigation district has been formed under the Oregon State laws. Improved market outlets would, no doubt, hasten this development.

The Silver Creek project: This project was pronounced feasible in the Whistler-Lewis cooperative report of 1916 providing reservoir construction to store flood waters, thus controlling the water on approximately 24,000 acres in the Silver Creek Valley, located
89 west of Burns—southwest of Burns. Controlling water on 24,000 acres and increasing its production would release 12,000 acres for other purposes, at the (160) same time provide feed to maintain the present livestock population. Using again the same basic figures on land utilization and yields as we used for the Blitzen and Harney projects, we would get the tonnage listed in Table 2 (b) on page 6, making a total of 2,428 tons, or 92 cars.

The summary for Harney County appears at the bottom of the page. Present tonnage 8,801, 650 cars; additional available within five years, as a result of development of the Blitzen Valley, which now has irrigation works constructed, would produce 3,700 tons, or 144 cars; making a total within five years of 12,501 tons or 794 cars.

Additional tonnage to be available upon complete development would be 20,335, or 789 cars, making a total, upon complete development, of 32,836, or 1,583 cars.

These estimates are likewise based upon untilization of 72 per cent of the lands under consideration for the production of livestock products. An increase of wheat, or other grains or potatoes, would substantially increase these figures. For computing the figures relating to Harney County, the yield per acre allowed was as follows: Wheat, 30 bushels, barley, 40 bushels, oats, 65 bushels. (161.) You find on page 7 of Exhibit 7, year average yield of crops grown at Harney Branch Experiment Station at Burns, period 1920 to 1927, giving the amount of water used, the bushels or tons per acre harvested, and then a third column, or fourth column, giving the yields used in the figures which are in my computations.

Take Federation spring wheat, 12 inches of water produce on an average of 51.9 bushels per acre. The figure I have used is 30 bushels. Hybrid 128 winter wheat produced 41.6 bushels per acre. I used 30 bushels. Swedish select spring oats produced with 12 inches of water 70.6 bushels. I have used 65 bushels. Trebi
90 barley produced on an average 56.8 bushels. I have used 40 bushels. Grimm alfalfa has yielded with 15 to 18 inches of water 7.25 tons, and I have used 3 tons, indicating the conservative nature of the figures which have been used here.

Incidentally these figures of the experiment station based upon this seven year period include one year in which there was a total crop failure.

At the bottom of page 7 you see approximate ownership of land by various large holding companies in Harney County, and these lands are now for sale and are being subdivided and sold off. On page 8 you will see summary of cost of establishing a pumping plant by the Harney County Branch Experiment Station (162) at Burns.

The last session of the Oregon Legislature appropriated $8,000 to be used on the Harney Branch Experiment Station near Burns to determine the following:

First: The cost of drilling and casing a well to supply water for an 80 acre farm unit:

Second: The cost of suitable engine and pump, installation and operation of same.

Third: The cost of preparing and leveling 80-acre tract for irrigation.

Fourth: The cost of distribution system; and

Fifth: The cost of producing crops under irrigation by pumping. A well was drilled to a depth of 85 feet and cased with an 18-inch galvanized steel casing to a depth of 60 feet. A Kimball turbine, deep well pump, is used, operated by a 25 horse-power semi-Diesel engine. The well furnishes an average flow of 1.7 second
91 feet, which is sufficient water for 80 acres. When not drawn on, the water in the well rises to within 6 feet of the surface and when pumped on for 12 hours or more gradually draws down to 42 feet, where it remains. The average lift is 35 feet during a 12-hour pumping period.

You will find listed there the cost of installing a pumping plant on the station, totaling $3,720.24.

Last year was the first year that this pump was under operation. A summary of the cost of producing federation wheat (163) and Grimm alfalfa on 19.4 acres with pumped water during 1927. Now this tract of 19.4 acres was used and these data because it represents what would be average farm operation conditions. The total cost of pumping on this area of 19.4 acres was $396.68. There was a revenue, which is not listed here but which I will give you from that 19.4 acres, of the following: 4,000 pounds of seed wheat at 2½ cents, $100; 5,785 pounds of feed wheat at 1½ cents, $86.78; 5.8 tons of

wheat straw at $3.00, $17.40; 2,800 pounds of Grimm alfalfa seed at 30 cents, $840.00; 13.4 tons of alfalfa straw at $3.50, $46.90; making a total return of $1,091.08, or a net return per acre of $35.79.

The test of irrigation by pumping shows that it can be done, that it is being done, and that good yields of crops can be obtained on a profitable basis. In our estimates, we have not taken into account the possibility of this type of irrigation. We excluded in our estimate of tonnage all possible development from pumping irrigation. There are thousands of acres which could be utilized on a pump irrigation basis in Harney Valley. In our estimate we have included

(165) only projects to be irrigated by gravity systems.

92 Would add one word in regard to Harney County yields. This experiment station is located on land which has been classified by soil experts as being medium to poor, not even average of the land in Harney Valley.

As to northern Lake County, which will be crossed by the proposed railroad, it consists of approximately three million acres, of which 320,800 acres is in the Fort Rock, Christmas Lake, Silver Lake, Summer Lake, and Sycan Valleys. Of this area, 56,100 acres is now irrigated, or can be irrigated, with the present projects; approximately 25,000 acres is dry farmed in the area, principally cropped to rye, which is cut for hay. (167.) Beef cattle, sheep, horses, a few hogs and cream under the present conditions are the only commodities for export. The agricultural tonnage available in this area at present is listed in the first table on page 10 of the exhibit, making the total of 2,376 tons, or 213 cars, sheep, wool, beef cattle, horses, cream and hogs and miscellaneous products. When I prepared this data in February I didn't have complete data on the movement of wool, and there should be a change in the direction of this movement. Wool from Deschutes, Jefferson, Crook, Lake, and Klamath Counties, I have proposed to move east via the cross-State. In recent years this wool in increasing quantity is moving towards Portland. I failed to take into consideration that Malheur County and Harney County wool would move west over this line, which would really mean a gain in tonnage in so far as the cross-State is concerned, and increase the traffic rather than decrease it, as a result of this change in direction of movement. The northern Lake County tonnage, whether moving east or west, will necessarily move over the cross-State line, or a portion of it. (168.)

92½ I will indicate what portion of Lake County I have included in my study: Approximately 50 per cent of the county I have considered as tributary to the line. That territory north of Paisley, in Lake County, will be closer to the cross-State road than it is to the present railroad which terminates at Lakeview. As to the maximum distance of haul from Lake County points, which I have included in my study, to the location of the proposed line, the Summer Lake territory is as far south as I have gone in these figures and that would be about 30 miles.

93 The areas capable of development consist of the Summer Lake irrigation district of five thousand acres, which is now completed and ready for settlers; also the Silver Lake irrigation project, likewise completed, consisting of 6,500 acres. We would estimate that of the 230,000 acres in the Fort Rock and Christmas Lake Valleys that 46,000 acres of this could be selected to be situated properly which would make something practical and it is on this basis we have made our computations. In the Fort Rock Valley in 1922 the Oregon Bureau of Mines (169) made an extensive study to determine the extent of the subterranean water. The report states as follows: "That eight weeks of field study indicate that the Fort Rock Valley is in a syncline or depression caused by the sinking down of the series of volcanic rocks prevalent in central Oregon. The leaning walls of the depression are from 1,500 to 2,000 feet thick; the ground water level in this basinlike valley varies in depth from 15 to 40 feet below the surface." Now, the conclusions drawn by the geologists as indicated by this report were verified when four wells were actually drilled in this territory as result of a State appropriation. Repeated tests have shown that a two-second foot stream of 900 gallons per minute can be pumped continuously from a twelve-inch hole which has been drilled to a depth of two hundred feet, with a drawn-down of only two and one half feet. As to whether the portion of Fort Rock Valley where the test wells have been put down will produce crops: In 1922 or 1923, while I was county agent, we planted the first crops on the John Ernst farm in Fort Rock Valley (170) which has continued to be developed. There is on
94 the Ernst farm now 50 acres of alfalfa and about 10 acres of wheat. This Ernst well, as I recall, is drilled to a depth of 200 feet and the water raised to within 24 feet of the surface, drawn-down of two feet, and his lift is now 26 feet and it has stood up under continuous pumping for 72 hours, delivering 1,100 gallons of water per minute. The following is an extract from a recent letter from Mr. Ernst:

"The Fort Rock Valley—there are one hundred eighty thousand acres that can be irrigated, and I believe that with the coming of a railroad that in five years at least 50 per cent of this land will be developed. We have had many prospective buyers here in the last five years, who, while pleased with the crop prospects, when told that we are 75 miles from a railroad, are not interested.

"In the Christmas Lake Valley there is practically the same amount of land, the same water level; with the coming of a railroad this could be developed into one of the largest diversified farming districts in Oregon, but without transportation the State of Oregon will be a long time in realizing any financial gain in any way."

When this valley was settled in the Fort Rock and Christmas Lake Valley there were some 2,000 homesteaders (171) from 1909 to 1912. Practically all of the land is abandoned. These people came in at the time it was proposed to build that cross-State line.

They probably spent in the Fort Rock Valley around two million dollars in time, actual money invested, improvements, expenses and buildings. A large percentage of these homesteads are deserted at the present time. However, there are more people on the desert than one would think.

94½ I have held meetings at Fort Rock when there would be 70 or 75 people. You wouldn't know where they would come from, but they do make a living there, and they are there, running cattle, growing a little rye hay to winter those cattle on, carrying them through the winter.

95 Where there is irrigation by pumping, alfalfa is the principal crop; barley, oats, and wheat.

Q. Is it not true that a large variety of vegetables have been grown for experimental purposes and found successful on the Ernst ranch?

A. They will grow practically anything there that they do in the—any of the hardy vegetables.

It is similar in conditions to the land around Bend and Crook County and in the Goose Lake Valley. (172.) The proposed cross-State line runs about through the center of Fort Rock Valley. Although there are some 230,000 acres in the valley, I have included in my estimate of probable development only 46,000. I base my tonnage figures on the utilization of the land as given on page 10, 40 per cent to alfalfa, 25 per cent to wheat, 10 to pasture, 8 to barley and oats, two to potatoes, and five to farm buildings, et cetera. On that basis, taking three tons of alfalfa as an average yield, from beef cattle we would get 1,551 tons, 124 cars; from cream 1,916 tons, 127 cars; for wheat 8,619 tons, 208 cars; clover and alfalfa seed 517 tons, 34 cars; potatoes 4,305 tons, 239 cars; hogs and sheep 621 tons, cars 62; making a total of 17,529 tons, 794 cars.

Q. Now, is that from both irrigated lands and from dry (173) farming in the Fork Rock Valley?

A. That is just for irrigated lands. The development of irrigated lands in Summer Lake, Silver Lake, Fort Rock, and Christmas Lake Valleys, irrigated lands only.

Mr. DEY. Mr. Commissioner and Mr. Ellis, just by way of a suggestion, I wouldn't think of undertaking to limit the comment upon the exhibit, but this reading of the figures of each of these counties into the record, when it is already shown on the exhibit

96 seems to me quite unnecessary, only encumbers the record, and we are going to be here two or three weeks at the best, and if we give as much detail into the record on all of these exhibits we will not be through within the time fixed.

Mr. ELLIS. I think we can eliminate some of the detail figures on these, but quite a little comment is necessary in order to make the basis on which they are compiled clear. (174.)

Comr. MCMANAMY. I think it would be well, Mr. Ellis, if you only read such figures as are necessary to make the comments clear.

Mr. ELLIS. Yes.

In connection with these figures, we arrived at them on the basis of the following yields: Alfalfa, 3 tons per acre; wheat, 20 bushels per acre; clover and alfalfa seed, 3 bushels per acre; potatoes, 75 sacks per acre and barley 40 bushels per acre. Of this potential tonnage listed we estimate that 10 per cent should be available one year after the cross-State line is constructed, with 50 per cent available within five years. The development of an extensive hay-producing territory in the Fort Rock and Christmas Lake Valleys, which are available to adjacent desert sections, where a good many thousands of sheep winter annually, would result in a larger proportion of both Klamath and Lake County sheep wintering in this district than is the case at present. (175.) My figures do not
96½ contemplate an increase in the number of sheep handled in this region, but I have heard a number of stockmen in Lake County and Klamath County say that if they could get supplies of hay adjacent to the desert they would winter in that region. Contrary to general description, stockmen in that country call the Fort Rock Valley and the Christmas Lake Valley the low desert because of the fact that there is a very small amount of snow there in the winter time. Almost every winter a good many thousand sheep and cattle stay out there and browse all winter. It is my suggestion that with transportation the grazing possibilities of the area that is now unproductive would be much better utilized. Figures supplied me by Mr. Ernst show that the cost of establishing his irrigation plant in the Fort Rock Valley was as follows: Cost of drilling and casing the well, $450; the cost of a Lane-Bowler pump, plus freight, $750; cost of a Diesel engine-plus the freight, $1,187, making total of well and equipment $2,387. The cost of operating the pump per day, according to Mr. Ernst's figures: (176), Two hours, labor, care for engine, at 60 cents an hour, $1.20; fuel for engine, 15 horsepower, 12 gallons at 18 cents, $2.16; lubrication, 12 pints, at 7⅛ cents, 85 cents; total cost, exclusive of interest or depreciation, $4.21. His total operating costs for the 1927 season, when 50 acres were irrigated, show a total cost of $275.91, or $5.51 per acre. In that year 4 tons per acre of alfalfa were obtained in two cuttings; 40 bushels of Dicklow wheat per acre. This cost per acre is based on 50 acres. The cost per acre for irrigation by pumping can be compared with cost of irrigation by gravity system. The cost of gravity water varies a great deal—most of the projects running from $4.00 to $8 per acre. There is no question but what this cost in Fort Rock Valley would be reduced with transportation. They truck their
97 fuel now 75 miles, if they are shipping it to Bend (177) or the cost could be decreased a great deal by having power and by having direct rail transportation to the valley for fuel, in case they continue to use oil. There is plenty of power in the central Oregon country, plenty of water on the Deschutes, and I understand there has been a preliminary survey made contemplating the development

of electrical power. The $5.51 I mentioned is the cost per acre per year.

The cross-State line traverses the Christmas Lake Valley and it is very similar to the Fort Rock Valley. It is relatively level, susceptible to being irrigated with little difficulty. (178.) Both the Summer Lake and Silver Lake irrigation projects are now in use. They are not settled 100 per cent and they are having some difficulty financially but plans are under way for a refinancing to settle these projects, providing transportation is brought closer.

The agriculture of northern and western Klamath County is largely developed to livestock production. Both sheep and cattle graze on the timberlands, in which there are numerous mountain meadows with luxuriant grass. While the bulk of agricultural tonnage moves to coast markets, lambs and wool move east in considerable volume.

There are 68,120 sheep in Klamath County, of which 34,060 are marketed annually. Of these, on an average, 35 per cent or 11,921 go east as feeders. Because the route via the cross State would be approximately 313 miles shorter than the present route, and traversing feeding territory almost its entire length, these sheep would move via the cross State—35 per cent of the lambs, which is the tonnage indicated on page 12. The item "sheep (the east)," 357 tons is practically all lambs. (179.)

Q. Have you included in that figure only the portion which you anticipate will move through over the line to an eastern mar-
98 ket, or have you included any allowance for feeder sheep moving in and out of the territory served by the cross-State line?

A. I have only included feeder sheep, which now move to the feeding grounds of Idaho or mid-west, and that is all I have included in this figure. About 65 per cent of the Klamath lamb crop are finished down in the Klamath station, and then either shipped south or east.

Clover seed production is just starting in Klamath County, which must find a market in the mid-west and east. Within five years there should be 2,000 acres of clover-seed produced in Klamath County, four bushels which should provide the potential tonnage figure which you see on page 12 with the total available tonnage for the cross-State line given at the bottom of the page, that is 60 cars. (180.) Practically all of the sheep in Klamath County are grazed on the slopes of the Cascades, in the northern portion of the county, and it is figured that these feeder lambs that come off the range in the fall would be shipped via the cross-State line.

The clover seed will originate on the irrigated lands in Klamath County south and east of Klamath Falls. As to the total production that would move over the cross-State line: A very small percentage of it—35 per cent of the lamb crop, and that is an exceedingly small percentage, not more than two or three per cent of the total traffic, agricultural, that originates in Klamath County. That is all the

traffic I have included in Klamath County, the largest undeveloped peach soil in Oregon. There has been a lettuce demonstration there; 60 carloads were shipped out. Being perishable, it naturally would take the shortest route to eastern markets. We haven't taken this into consideration in our estimates but it offers considerable possibility of tonnage. (181.) The present tonnage from Klamath County I estimate would move over the cross-State line is
99 493 tons, or 44 cars. I calculate most of that crop to the East from Klamath County would move over the cross-State line. Within five years I estimate 733 tons, or 60 cars would move over this line from Klamath County.

Deschutes, Crook, Jefferson, and Wheeler Counties:

This block of four counties adjoining in central Oregon are extensive livestock counties. Their total area is 64,801 acres. Within their borders are 200,400 sheep. Wheeler and Jefferson Counties are devoted almost entirely to livestock and wheat growing. On the irrigated lands of Crook and Deschutes Counties, poultry, dairying, potatoes and clover-seed production are rapidly expanding. There are 1,833 farms in the four counties and the agricultural industry is valued at $25,533,000. Figuring an annual turnover of 50 per cent of the sheep (182), about 70 per cent of this turnover is marketed as feeder lambs and go to the feed lots of the Northwest, Idaho, and mid-west points, making a total of the figure which you see under "sheep" on page 13 of the exhibit. There should also be a substantial movement of breeding bands from the Cascade Ranges to Idaho and Malheur and Harney feeding grounds. Thousands of sheep move into this range area from the eastern part of the State annually and are shipped back for wintering. We estimate from this source that there would be a thousand tons, or 100 cars, annually. These sheep just mentioned move from the eastern portion of the State to utilize the ranges of the Cascade Mountains, to a point in Deschutes County, then trail out to the ranges. Some sheep are shipped to the ranges in Crook and Jefferson Counties. They are shipped at the present time and move around via the Deschutes, around rather than across the State. They are loaded on the Deschutes branch somewhere near Bend and move
100 down to the main line of the Oregon-Washington (183) Railroad & Navigation Company and around over the Blue Mountains; the bulk of them are now unloaded in the Umatilla County country. I figure there would be a shifting in the utilization of the ranges in the Cascade Mountains from those people who are down in the Columbia Basin area, sheep men, to open up this territory as a grazing territory to the men in Harney and Malheur Counties. We can eliminate this figure from wool because I failed to take into consideration westbound wool traffic from Harney and Malheur County which has more than offset this which we have been moving east from these figures. We will change all these

figures on eastbound wool from Lake, Klamath, Deschutes, Crook, Jefferson, and Wheeler Counties. (184.) The data which we have submitted here indicate that there would be 941 tons of wool, or 63 cars, moving east via the proposed cross State. We would eliminate all that. In our figures we failed to take into consideration the westbound traffic of wool over the cross State from Malheur and Harney Counties. The clip in these two counties is 4,600,000 pounds of which 80 per cent of it moves west to Portland, or 3,680,000 pounds, making a total of 1,840 tons, or 121 cars, giving us a net gain in traffic of 899,000 pounds, or 58 carloads for the cross-State line. That originates in Malheur and Harney Counties. There is some possibility of wool originating at other points along the line moving eastward over the cross-State line. It is moving east and constantly in smaller volume. Under the present practice it moves to Portland for cleaning and consolidation with other shipments that go either direct by rail or by water to Boston. (185.)

Then on clover seed, as in Klamath County, clover-seed production in this central Oregon territory, Deschutes and Crook Counties is rapidly increasing. There were 100,000 pounds of red clover and alsike and white clover seed produced in these counties
101 this year. Making a tonnage, as you see, of the third item under clover seed. We expect a 500 per cent increase during the next five years and that gives our potential tonnage figure which you see there. When I say 500 per cent increase in clover seed, I simply increase it from 3 to 15 cars. The summary from those four counties is 3,487 tons, 352 cars. The total tonnage after five years is 3,737 or 367 cars. Now in both Deschutes and Crook Counties poultry is rapidly expanding, and it may be that within five years carload shipments of eggs east will be made. From shipping points in these counties the proposed road would shorten the route to Ontario by from 40 to 127 miles, depending on the point of origin and would eliminate the necessity of lifting this traffic up over the Blue Mountains.

In these counties of Deschutes, Crook, Jefferson, and Wheeler, there are enormous quantities of other products produced in addition to the ones listed. (186.)

Q. What are some of the other commodities that are produced in those counties that might move in lesser amounts over the cross-State lines?

A. Oh, I have mentioned eggs here. As a matter of fact, agriculture produces commodities largely which will find an outlet to the Pacific coast. I think I have included practically everything of an agricultural nature. Now, it represents only a small per cent of the production. They produce several hundred carloads of potatoes up in that region; they grow some grain, the dairy industry has increased enormously; but most of these products find a market along the coast. And I would include only those commodities that

would logically move in substantial quantities over the line; I make no allowance for incidental movement of potatoes, or commodities of that kind.

Grant County borders Harney County on the north and like Harney its agriculture consists largely of the production of
102 feed, cattle and sheep, which are 31,280 and 97,870, respectively. The county is now served by a narrow gauge extending from Prairie City to Baker, since last summer by the Herrick logging (187) road which terminates at Seneca. With the construction of the cross-State road, the large percentage of the cattle and sheep would move from Seneca, thence south to Crane and west via the proposed railroad. They would move in that direction since most of the cattle in eastern Oregon find a market in the Northwest, and this territory is practically out of taking advantage of the California market at present. They would ship that way because it would be the shortest route for them, and in addition to that it would give them a choice of markets, the North or South markets, without increasing their distance. There are 31,280 cattle with a turnover of 22 per cent. Figuring 50 per cent would be loaded at Seneca for shipment via this cross-State, you get the tonnage figure as given on page 14. Sheep, there are 97,870 of which there is 50 per cent turnover, or 48,935, which would be marketed annually. Of this estimate, 25 per cent that go as fat lambs off the range, and one-half of these grass-fat lambs we figure would go to California markets, giving the tonnage figure which you find under "sheep," total of 22 cars, with a total present tonnage from Grant County of 159 cars. (188.) The potential tonnage figure isn't represented in any increased tonnage of agricultural commodities from Grant County, as the county is now well stocked, and there are no large areas susceptible of development agriculturally. We would expect, however, within five years, as southern markets opened and expanded to see 25 per cent more tonnage shipped from Seneca than that estimate for the present. This would be a shifting of shipping point, and not an increase due to expanded production. The livestock from Grant County is now loaded from various points, including Prine-
103 ville, Heppner, Condon, Austin. With this cross-State line we figure a larger percentage ultimately would be shipped from Seneca south and southwest. The distance necessary to drive the stock would be decreased through better feeding territory, because Seneca is located in the Bear Valley country where there is plenty of good grass. They could get their stock out of the county with a smaller shrinkage.

The Baker County tonnage is negligible. Baker County is now sending to California markets through Idaho creameries a million pounds of butter per year, giving the tonnage which we have (189) listed there of 500 tons, 33 cars.

There might be a slight movement of fat lambs from northeastern Oregon to California during July and August. We know California

buyers are reaching out to the Northwest territory where they never have reached before. This year some 12 or 15 carloads of lambs were shipped from Heppner around to Portland and then south to California markets.

It is possible that there would be some traffic originate in Baker County and in Union County which would go via the cross-State to California. (190.)

I have included in these 33 cars from Baker all the butter that is now actually moving to California points. It is shipped down to Payette and Caldwell and from there sent to California; now moving through Ogden. I have made no estimate for probable increase in that tonnage or any other commodity that might move to those destinations.

That completes my discussion of the agricultural counties on the east side of the Cascades. Now, crossing the mountains to Lane County, it is the fifth most wealthy agricultural county in Oregon. It has a total agricultural wealth of $36,771,000. There are 4,168 farmers in the county, an increase from 3,279 in 1920, indicat-
104 ing a marked tendency towards intensified agriculture, such as poultry, vegetable raising, fruit production, the bulk of which must go to eastern markets. (191.) Small grain production, livestock, dairying, poultry, fruits, nuts, vegetables provide the major sources of income. The figure of 36 million that I referred to is the 1925 census figure on the value of farm lands, buildings, and equipment; it is not the assessed value. There are 5,550 acres of clover in Lane County, which produces on an average of three carloads of clover seed, fifty per cent of which goes east via rail, giving the figure under "clover seed" on page 15. There are 3,240 acres of apples. During the four years 1924 to 1927 an average of thirty cars annually were shipped. Shippers estimate of these 50 per cent moved east, or 15 cars. There are 736 acres of pears in Lane County, with shipments averaging 21 cars per year. There are 2,784 acres of prunes in Lane County (192) which produce on an average annual yield of 2,784,000 pounds. Fifty-three per cent, 26 cars move east via rail as dried prunes. During the past four years average annual shipments of green prunes have been eight cars. There are 297 bearing acres of walnuts and filberts, which produce an average of 1,000 pounds per acre, providing 6 cars. The Lane County canned fruit, an average pack in 1927 amounted to 313,000 cases, or approximately 400 carloads. This is a growth from eight carloads in 1909. Of the 1927 pack, 33.3 per cent moved via rail to points east of Ogden, or 116 cars. Now western Oregon shipped to points east of Ogden 414 carloads of eggs during 1927, an increase of 33.5 per cent over 1926. Forty-one per cent of the chickens in western Oregon are in the district Linn, Benton, Lincoln Counties and south, all
105 tributary to Eugene. Construction of Pacific Cooperative Egg Producers' branch at Eugene, which is now completed and operating, will no doubt make Eugene an assembling point for this entire

district as far as eggs are concerned. On this basis we have 169 cars of eggs available for cross-State traffic. The car lot importations of corn into Oregon via the (193) Portland gateway in 1927 amounted to 968 cars, an increase from 505 cars in 1925. As more than 40 per cent of the chickens, hogs, sheep, and dairy cattle of western Oregon are in the counties Linn and south, it is reasonable to assume that 40 per cent of this corn tonnage would come via the cross-State line and through Eugene. This corn is shipped largely from Nebraska and mid-west points, 385 cars. Dealers' figures indicate that Douglas, Lane, Benton, and Linn Counties use annually forty cars of alfalfa hay, not figured elsewhere, that will come via this cross-State line, giving 40 cars. There are 50,440 dairy cows in Linn, Coos, Douglas, Benton, and Lane Counties. As the irrigated valleys in eastern Oregon develop, requiring the stocking of dairy cattle, we figure the annual movement of 2,000 head of dairy cattle to eastern Oregon from these counties via the cross State, giving 66 cars.

Feed: Data gathered in 1924 indicates concentrated feed imports into Lane County amounted to 326 carloads, exclusive of corn. One half of this should come via the cross State. There has been a substantial increase since that time, as recent data from every western Oregon county shows, due to (194) the increase in the poultry industry, 168 cars, making a total tonnage for the cross State from Lane County of 1,018. That feed moves from the producing irrigated sections east of the Cascades.

As to potential tonnage: The pear shipments increased 37 per cent from Lane County between 1924 and 1927. Most of the young
106 acreage pears which are coming into bearing are of the late varieties. Local growers expect an increase of 50 per cent in the next five years. The canned fruit inspector estimates 20 per cent annual increase during the next five years, which should be ten carloads. From prunes, 15 to 17 per cent increase is predicted by the U. S. Bureau of Economics in a recent study, trees to come into bearing within the next five years, which would be four carloads. They made a careful study of the dried prune industry in the Willamette Valley—where prunes went, what was the matter with it, and all about it, and that is the figure that they have used as a result of that study. This estimate would largely be produced from orchards now planted (195) that will come into bearing later. There will be no additional planting of prunes. There are 311 acres of non-bearing walnuts and filberts to come into bearing in Lane County. These along with natural increased yield from present growth would increase nut production 200 per cent, so far as export is concerned, or 11 cars. Since 1919, the Oregon pack of canned fruits has increased 103 per cent, and of vegetables 300 per cent, or an average of 117 per cent. The expansion in Lane County has been more rapid than this. Figuring the same rate of growth for the next five years as has taken place in the past nine years, there will be an increase of 65 per cent

in the next five years. Reducing this to 50 per cent for conservatism, we have increased tonnage of 58 cars from canned fruits and vegetables.

Some canners, incidentally, estimate a hundred per cent increase within five years.

Since 1924 the corn imports into Oregon have been increased 90 per cent, growing from 505 carloads to 960 carloads. This
107 corresponds to the expansion of the poultry industry and can be expected to continue, though not so rapidly. Figuring 100 per cent increase in five years, or 385 cars.

From alfalfa hay: As population increases, the whole (196) milk requirements will increase. The dairy herds supplying whole milk are heavy users of alfalfa hay. There should be a 10 per cent increase, or four cars.

Feed: If growth of poultry, dairying, sheep, and swine continues at the same rate as it has for the past five years, a 20 per cent increase in feed requirements would be conservative, or 33 cars.

In eggs, Eugene is bound to become the grading and distribution center for the southern portion of western Oregon. The poultry industry of the State has increased 25 per cent since 1924. The production of export eggs increased 33.5 per cent last year over 1926. It is reasonable to assume that the industry will double in the territory tributary to Eugene within the next five years, or 169 carloads, a total of 674 cars, potential tonnage. That is added tonnage which will be available five years hence, making a total tonnage of 1,692 cars within five years. (197.) From my knowledge of the situation, I believe those figures are conservative. In all of them we used the rate of increase which has prevailed during recent years and then discounted that a little, figuring the rate of increase won't be as rapid as it has.

Douglas County is the largest county in western Oregon and extends from the summit of the Cascade Mountains on the east to the Pacific Ocean on the west. It has an area of 31,941 acres, 18.1 per cent of which is in farms. There are 2,551 farms in the county, which together with buildings, livestock, and equipment represent an investment of $25,820,000.

108 Fruit and vegetable growing provide the major source of farm income, followed closely by livestock, poultry, dairying, cereals, and general crops. Apples: There are 976 acres of apples, of which 500 acres are in commercial orchards. The average annual shipments of apples during the four years 1924 to 1927 were 80 carloads, of which 70 per cent, according to local shippers' estimates, moved to points east of Ogden, or 56 cars.

Pears: There are 880 acres of pears, a large portion of which are yet to come into bearing. Average annual shipments of pears, 1924 to '27, were 71 cars, the number increasing from 69 in 1924 to 88 in 1927. Fifty per cent moved east, or (198) 35 cars.

Dried prunes: There are 11,000 acres of prunes in the county, from which there is an average crop of ten million pounds, of which fifty three per cent moves east via rail, or 95 cars.

Of green prunes, the average annual shipments to the east, 1924 to 1927, were 50 carloads.

From fresh cherries: There are 200 acres of cherries in the county. Shipments from 1924–27 averaged 3 cars annually.

Canned fruits and vegetables: The 1927 pack in Douglas County was 80,000 cases. Twenty per cent annual increase for several years is anticipated. Sixty per cent moves east via rail, or 400 cars.

From broccoli: The average annual shipments of broccoli during the past four years have been 419 carloads, all of which go east. Broccoli shippers now say that their product arrives in eastern markets from 24 to 48 hours after similar produce started from California at the same time. Such a handicap has been an important factor causing a great fluctuation in acreage and has prevented any expansion in Douglas County—419 cars.

Douglas County now has 70,000 turkeys and is the banner turkey county in Oregon. Dealers' estimates place (199) 1927 ship-
109 ments at 20 cars with prospects for a 25 per cent increase for 1928, 50 per cent of which, it is estimated, goes east, or 10 carloads.

From feed grains: The poultry business has undergone rapid expansion in Douglas County, as elsewhere in western Oregon. We have accounted for this tonnage in the Lane County estimates. There is, however, now under way a move on foot to establish an egg assembling and grading plant at Roseburg, so we have excluded, so far as egg tonnage is concerned, any figures for Douglas County, including that in the Lane County figure.

Also we have excluded any incoming tonnage on corn from Douglas County. The data gathered from dealers in Douglas County shows that 90 cars of corn were imported in 1927. This is an increase from 26 cars in 1924 or 288 per cent. This is also accounted for in the Lane County figure.

From mixed feed: Grain dealers' estimates show increase in sales of mixed feeds and grain from 50 to 200 per cent since 1924. In 1924, 172 carloads of such feeds were imported. Estimating a 50 per cent increase, the present tonnage would be 258 cars, or 7,740 tons. There is a tendency to mill various feeds in local plants at Roseburg from grain which is shipped in. This naturally would (200) increase the demand for eastern Oregon grain. We estimate that 50 per cent of this total feed tonnage would come via the cross State or 155 carloads.

Between 30 and 50 carloads of potatoes are imported into Douglas County, Oregon, annually, largely from Washington and Idaho points. This would come, if the cross State be constructed, from producing districts in eastern Oregon, 35 cars.

There are 2,000 cows in the lower Umpqua and Smith River. Smith River is tributary to Reedsport. Conditions are simi-
110 lar to those in Coos and Tillamook Counties. The land is worth more for pasturage than for hay. One thousand dairy cows would use one ton of alfalfa per year, that could be purchased at a lower cost. We estimate 68 cars coming via the cross State or total, with the present tonnage, of 969 cars. In arriving at one ton and a half to put a cow through the winter, we assume, of course, that that was only a small portion of the total annual feed needed for each cow. Eight months' pasture is very good pasture season in the coast country. It will take about two tons of hay to get a cow through the other four months' period. (201.)

Potential tonnage in Douglas County:

Pear shipments have increased 27 per cent since 1924. Many new orchards of late varieties are coming into bearing, and the old orchards which have been top-worked to better varieties are beginning to produce. Many growers estimate a 100 per cent increase for eastern shipment within the next five years. With the same rate of increase that has prevailed between 1926 and 1927, there would be a 50 per cent increase within five years, 17 cars.

By "top-worked" I means there was a rather large planting of pears in Douglas County of wrong varieties and they are now grafting the tops of those trees to improve late varieties, which largely go east.

Dried prunes: We would expect a 15 per cent increase within five years, based on the U. S. Bureau of Economics study, 13 cars.

Canned fruits and vegetables: Cannerymen's estimates indicate a twenty per cent annual increased pack, or one hundred per cent within five years. Reducing this to 50 per cent for conservativeness, we have 23 cars. (202.)

111 Broccoli: With improved transportation, enabling Douglas County to compete with California on equal terms, shipments should increase one hundred per cent, or 419 cars. Douglas County actually has shipped as high as 957 cars in one year. She would be getting back to about what they have already shipped their peak year.

From feed grains: At the prevailing rate of expansion in poultry and other livestock, the use of imported feed grains should increase fifty per cent in the next five years as it has in the past three years, or 77 cars, making a total potential tonnage of 549 cars, and the total within five years of 1,518. In my figures I have included those commodities which are produced there and find an outlet in eastern markets, assuming that it moved via the cross-State, because that is the shorter route. I based that data upon what speakers told me the markets they were actually shipping this stuff at the present time.

Linn County is a typical Willamette Valley County (203) has an area of 1,445,000 acres, of which 32.3 per cent is in farms. There are 3,300 farms in the county, an increase from 3,041 in 1920.

There is $35,787,000 invested in the agricultural industry. The major sources of agricultural income are from production of general farm crops, such as wheat, cloverseed, grass feed, vetch feed, livestock, dairy, poultry, fruits, and nuts. In cloverseed there are 15,034 acres of clover, from which there is produced an average of
112 420,000 pounds of seed annually for export. Dealers' records indicate that 35 per cent of this goes east via rail, or five cars. From small seed crops, including rye grass, there are 1,400 tons exported annually, according to local buyers, of which 20 per cent goes east via rail, or 18 cars.

From apples: There are 317 acres of apples, producing 43,684 bushels in 1926, an average annual pack of four cars.

Pears: Four cars.

Prunes: There are 2,394 acres of prunes, which produce an average annual crop of a thousand pounds per acre; 53 per cent goes east via rail, or 25 cars.

Cherries: There are 200 tons of fresh cherries that were purchased in Linn County in 1927 for shipment east, or 20 cars.

Strawberries: 1,200 acres of strawberries in the (204) county. In 1927, 7,000 barrels, of 500 pounds, packed, and indications are that this pack was increased this year—87 cars.

Walnuts, which is an expanding industry in the county, one car.

Canned fruits and vegetables: The total cannery pack in the county is 169,700 cases, an increase of twenty-one per cent over the year previous. Forty per cent of the pack goes east via rail.
113 One cannery has doubled its production each year during the past two years and expects to double last year's production this year. Sixty cars. From imports of feed grains and prepared feeds: Dealers' estimates indicate that 5,000 tons of feeds are imported annually—50 per cent of this would come via the cross State or 100 cars making a total present tonnage of 324 cars.

Potential agricultural tonnage in Linn County: The late pear acreage is just now coming into bearing—100 per cent increase is estimated within five years, four cars.

Dried prunes: Increase, 4 cars.

Walnuts: One car.

Canned fruits: Expansion of the cannery business has been several hundred per cent during the past two years. While it isn't expected that this rate will continue indefinitely, a 50 per cent expansion within five years is reasonable, or 30 cars.

Of imports between 1920 and 1925 there was 23 per cent increase (205) in sheep in Linn County, 22 per cent increase in poultry, 4.3 per cent increase in dairy cows. A similar increase can be expected the next five years, which should increase all imports 20 per cent, or 20 cars, making a total potential tonnage of 59 cars, and total within five years of 383.

Benton County: There are 1,369 farms in Benton County, which are located in the central portion of the Willamette Valley. These

farms comprise 214,558 acres, and represent an investment of $16,450,000. The major sources of agricultural income are from the production of wheat, vetch, clover, and grass seed crops, livestock, livestock products, dairying, fruit and nut production, and poultry, which is a growing industry, and there has been a constant increase in the number of farms since 1910. At that time there
114 were 1,098 farms. This increase in the number of farms is constant with the trend in agriculture toward more intensified production, including small fruits, poultry, and production of vegetable crops.

Clover and vetch seed: Four thousand acres of clover. From this acreage there are produced on an average of six carloads of seed or 90 tons. Dealers' estimates indicate that 35 per cent of this goes via rail to points east of Portland, or two cars.

From apples: 85 cars. (206.) Pears, there are 156 acres. Shipments from this acreage have increased from ten cars in 1924 to 33 cars in 1927. About 50 per cent of the pear crop consists of late varieties which go to eastern markets. Production of these varieties should increase at the rate of 20 per cent per year during the next five years, 12 cars.

Dried prunes: There are 1,000 acres producing prunes, which on an average yield a thousand pounds of dried prunes per acre—53 per cent moves east via rail, or 10 cars. Canned goods and vegetables: The cannery pack for 1927 was 44,368 cases, slightly less than 1926. The cannery records show that for the two years '26 and '27, 72 per cent of the production moved by rail to points east of Ogden, 30 cars. Dealers' records show that approximately 250 carloads of feed grains and prepared feeds are imported annually to Benton County, exclusive of corn. This represents an increase of 25 per cent since 1924. 50 per cent of this tonnage should come via the cross-State line in the form of cheaper feed grains from the irrigated valleys, or 100 cars.

Potential tonnage: Figuring one hundred per cent increase in pears due to bringing into bearing of the late varieties (207), 12 cars. Dried prunes: One car. Estimating a 25 per cent increase in cannery pack in five years would be eight cars. The increase in feed imports, 77 cars, a total potential tonnage of 28 cars in five
115 years. A total tonnage within five years of 267 cars.

Lincoln County: Like other Oregon counties bordering the Pacific Ocean, agriculturally it is largely developed to dairying, sheep, and goat raising. In common with other coast counties, hay is produced with difficulty. Bringing eastern Oregon alfalfa hay closer to the territory should cause it to use hay in the same proportion that Tillamook now uses it. Seventy-five per cent of the dairy cattle of Lincoln County are tributary to the Southern Pacific branch at Toledo. One-half of 3,504 cows, or 1,750 cows, would require one ton of alfalfa hay per year, a total present tonnage of 116 cars of alfalfa. The use of alfalfa would release 876 acres for

pasture which is now utilized for hay, thus increasing the cow population by 876, which would likewise require one ton per head of alfalfa, or 58 cars. The idea which I have suggested as a potential factor is the basis for the dairy industry in Tillamook County. (208.) They have found it more profitable to ship in hay and utilize the land for pasture. That practice is spreading to other coast counties and will continue if they can get hay as cheaply as Tillamook gets it. The cross-State line will shorten materially the length of haul for hay from eastern Oregon counties. The total within five years from importation of alfalfa via the cross State would be 200 cars. (209.)

Coos and Curry Counties: There are 1,551 farms in Coos and Curry Counties, located in southwestern Oregon. These farms comprise 285,986 acres and represent an investment of $16,078,834. The major income is from dairying, there being 14,420 producing cows in the two counties. These cattle, sheep, hogs, goats, and poultry, small fruit and vegetable crops constitute minor agricultural enterprises; 1,904 tons of cheese and 519 tons of butter were produced in 1927. Hay is produced and cured with difficulty for dairy
116 cattle. Approximately 2,500 tons of hay are now imported annually. One-half of the dairy cattle, or 7,210 cows, would use one ton per head if eastern Oregon alfalfa were available at a lower cost, which would be the case if the proposed line were constructed, providing 480 cars. A survey among feed dealers indicates that they now buy shipped-in grains and other concentrates to the extent of 4,469 tons, one-half of which, it is estimated, would come over the proposed line from Malheur, Harney, and Lake Counties and points east of there, or 89 cars. The annual pack of fruits in Coos County is 10,000 cases, or 215 tons, of which 50 per cent, it is estimated, would go East, or 3 cars; with a total present tonnage of 572 cars. Potential tonnage: Shipping in of 7,260 tons of alfalfa hay would release 3,630 acres of land. (210.) Importation of this alfalfa hay would release 3,630 acres of land, which is more valuable for pasture than for hay, and should support a cow per acre and would require 3,630 additional tons at one ton per acre, 240 cars. Broccoli has been successfully grown in the Coos Bay region, beyond any possibility of doubt the production of broccoli is a success there, and the shorter route to the East over which this commodity could be shipped should increase the production of broccoli that should go to eastern markets approximately 150 cars annually. Likewise lettuce has been successfully grown in Coos County. Climatic conditions are such that it does well there and should provide 50 cars for eastern shipment.

Canned fruits and vegetables—an increase in the pack should provide 8 carloads. This is based on a 50 per cent (211) increase in the next five years. The increase in number of dairy cattle will be 25 per cent during the next five years, taking into con-
116½ sideration the utilization of alfalfa hay, making available a

greater area for pasturage purposes, making an increase in the feed demand of 35 per cent within five years, which would be 31 cars; total potential tonnage of 479, making a total from Coos County available within five years of 1,051 carloads.

Josephine County, pages 21 and 22: The following tonnage data on Josephine and Jackson Counties is submitted herewith not because any substantial portion of this tonnage is apt to move via the cross-State railroad if the Klamath Falls-Alturas line is constructed, but in case a railroad is constructed from Butte Falls approximately 65 miles east to a junction with a Bend-Klamath Falls line, then the route for agricultural tonnage originating in Josephine and Jackson Counties and moving to points east of Ogden would be via the proposed cross-State line. It is because of this possibility that this tonnage is herewith submitted, although prior to the construction of the Klamath Falls-Alturas line, no doubt some agricultural traffic, both export and import, would move via the cross-State line.

Now, people in Josephine and Jackson Counties are hopeful that some day, to tap their territory, there will be a line (212) extended from Butte Falls across to a junction with a Bend-Klamath Falls line. That is the only reason we have submitted the figures which you find on page 21. There were 69 carloads of feed imported into Josephine County in 1925, 91 cars during 1927, or an increase of 31 per cent. The summary for Josephine and Jackson counties is separately listed. The potential tonnage, when the Butte Falls line is completed, if it is, will give the annual average shipment of apples, 1924 to 1927, from Josephine County, 41 cars; 65 per cent moves to points east of Ogden, or 26 cars. Pears: Pear shipments increased from 28 cars in 1924 to 83 cars in 1927, an average annual shipment of 63 cars, of which 50 per cent moves east; 63 cars.

116¾ Bulbs: The acreage has grown from 30 acres producing 3 cars in 1927, to 250 acres with 20 cars in 1928. They expect an increase of 100 per cent within the next five years, which would make 40 cars. From feed grains and mill feeds: The imports of these feeds increased 31 per cent between 1925 and 1927. The same rate of increase is expected during the next five years, which (213) would be a total of 55 cars. Making total potential tonnage carloads of 275, of which we estimate 50 per cent would move via cross State in case the Butte Falls line were constructed, or 137 cars. On the same basis we have developed Jackson County figures on page 22. Fifty carloads of feed are now imported annually, according to dealers, which represents a 100 per cent increase since 1924. Jackson County is the banner pear producing county in Oregon, producing 2,811 carloads in 1927. The agricultural investment is $26,157,914, and the number of farms 2,142. A shorter route to the consuming markets where Jackson County pears now go, also a cooler route, would be of material value to this district. It would result in better handling conditions for the fruit. There are 6,693 acres of pear orchards, from which were produced in 1927,

2,811 carloads of pears, an increase from 2,016 in 1923, or 39 per cent. Of the 1927 production 624 cars went to canners along the coast and the balance to markets east of Ogden. On the same basis of increase for the next five years as has prevailed during the past, the additional cars for Easterpn shipment would be 852, making a total for pear carloads available within five years of 3,038; apples 286, canned fruits 28; dried fruits 3; making a (214) total tonnage from Jackson County, carloads 3,355. Estimating that 50 per cent of this tonnage would move via the cross State, if the Butte Falls line is built, would be 1,703 carloads. This is summarized on page 23 of the exhibit. The total cars available at the present time are 5,928.

In my study I have included only agricultural products and have made no attempt whatever to include any other commodities that might move over the line. I have included just those com-
117 modities now produced in the county, applying to them the rate of increase that has taken place in the last few years, extending that over the next five years and estimating the traffic which (215) would move east or west over this proposed railroad, according to the logical markets as they now exist. I have excluded a whole lot of tonnage that might have been estimated. For instance, the settlement of 100,000 acres of irrigated land in Malheur County involves the shipping in of a great deal of farm machinery, building materials, furniture, a whole lot of additional tonnage that has not been taken into consideration; and the same thing would apply in Harney and Lake Counties to any irrigation development.

Exam. ROGERS. Is there a figure of 58 cars to be added to the total?

A. On wool? I gave you that. Yes; a net of 899 tons, 58 car lots. That would go in present tonnage column, now available.

Now the first table on page 24 shows the growth of the cannery industry in Oregon, 1919 to 1927, giving the cases packed of fruits and vegetables. It shows the tendency of production in western Oregon to be towards intensified type of crop, marketed through the cannery, commodities which find a market in the (216) Mid-west and East very largely. The total at the bottom of the page shows the increase in number of farms.

To explain the relation of the table at the top of the page to this cross-State line: The point is that there is an increase in the cannery pack in western Oregon. The bulk of this material, or of these commodities, must move East, and it would be a materal advantage if they went over a shorter route.

117½ I included in my preceding table by counties estimates which include these figures on page 24. This is really supporting data for what has preceded. It shows that there has been an extension in the cannery business and that this volume will increase over the cross-State line.

As to whom the advantage of movement over the shortest route would accrue: It would enable our packers to give better service to the purchasers of canned goods, getting a product to them on a quicker delivery. It might ultimately result in lower rates; I don't know about that. I am not making that suggestion at this
118 time. (217.) The benefit to packers would be in quicker service.

As to the decrease in the 1927 figure over 1926, in that year (1926) there was an overproduction of canned goods in the country as a whole and there was a slight curtailment in 1927; also there was a smaller pack because our crops here in the Willamette Valley were not as good as the previous year. Those two things combined caused a reduced pack in 1927. However, that figure will be exceeded this year considerably, from data we now have.

The table at the bottom of page 24 shows the tendency that is manifest in these counties west of the Cascades toward a more intensified agriculture and increase in the number of farms, brought about largely through the division of general farms. That means that more and more western Oregon agriculture will be devoted to intensified crops, vegetable production, fruit growing, nut production, poultry, which would find a market very largely in the East. Of course the shortest route here likewise to market those commodities would (218) be an advantage.

The total on page 25 is self-explanatory, showing the car lots of corn imported into Oregon, the figures being supplied by the State grain inspection department, actual inspections being made on grain here. This does not include all the corn that is imported, either. There is some corn shipped that goes by the inspection point, which originates in Nebraska and is shipped to the dealer direct without inspection. This corn is used for poultry feeds, mixture, and almost entirely in western Oregon.

The next table shows the car-lot shipments of perishable vegetables, exclusive of broccoli, from western Oregon, by products. Now in our data we included counties to be benefited in western Oregon, and Linn, Benton, and Lincoln, south of there, excluding the northern counties because from these counties there would be a shorter route via the proposed cross-State. By districts there in 1924, 399
119 cars were produced in the northern portion of the Willamette Valley of these perishable commodities, and only 14 (219) cars, or 3 per cent, in the district south. In 1927 the percentage was even more marked, 703 cars being produced in the district north, 5 cars in the southern district, or only seven-tenths per cent. I think the transportation has something to do with it. Now they do grow vegetables in Lane County in the vicinity of Eugene, in large quantities, but they convert them into canned goods rather than to ship them fresh. Climatic and soil conditions are not materially different from the northern Willamette Valley conditions and the southern Willamette Valley conditions. We believe that improved facilities

for shipping perishable commodities would have a definite tendency to increase the production of these commodities in the southern Willamette district. Fresh vegetables produce a much larger return per acre than do vegetables or fruits sold to the canneries.

On page 26 you see the car-lot shipments of eggs from California, Washington, and Oregon for 1926–27. California shipped 1,195 cars in 1925, Washington 943, and Oregon 152 cars. This shows substantial increase in the poultry business, indicated in our data throughout this presentation, which increase will (220) continue. Poultry business has increased more rapidly in the northern than the southern portion of the Willamette Valley. No doubt one of the reasons for it is being further away from the grading and centralizing plants. We believe this industry will be materially aided by a shorter route to eastern markets.

The table on page 27 shows distribution of dairy cows, poultry, hogs, and sheep, by counties, in these western Oregon counties. We have used these figures as a basis for our data on estimating the percentage of corn, for instance, that would be utilized in this territory and which would come via Eugene.

120 In this table I have included only the counties which I believe would be benefitted by the cross-State line.

At the bottom of page 27 is a statement relative to the savings to livestock shippers who are shipping from southwestern Idaho and southeastern Oregon to San Francisco markets. From Ontario, the center of the livestock producing territory of the region, to San Francisco, via existing routes is 1,328 miles, requiring three runs and two feeds if a special stock train is run; otherwise four runs and three feeds. I used Ogden as a gateway, as I remember. (221.) I did investigate, however, to determine what routes they were moving by at that time (last February). The shrinkage and feed cost on a car of 1,000-pound steers at 8 cents a pound, would be about as follows: Two feeds $17.50 a feed would be $35. You get three and one-half per cent shrinkage the first run of 400 miles, 1 per cent for each additional run, or a total of 5½ per cent, which costs the stock grower $110 or a total cost of $145. Now, the shrinkage and feed cost via the proposed route would be as follows: The distance from Ontario to San Francisco would be approximately 817 miles, which could be made in two runs and one feed, or a total cost of $170, a saving per car of $37.50 on 8-cent steers. Now these figures as to shrinkage, worked out as a result of an expensive survey among stock growers of the Northwest, are pretty well generally recognized as being about the average.

A similar saving would be made on sheep. I would correct that statement as to somewhat greater. I think on sheep it (222) would be about the same. Hogs probably a little less. In making this calculation I have only taken into account the distance and number of feeds. It would be important to take into consideration also the grades traversed, since downhill grades are worse than uphill grades

the way livestock or cattle are jammed around in shipment. I am not sure as to comparison of grades of the proposed with the existing route. I know the proposed line is fairly smooth running. The country is fairly level and there should be no long grades. Another point in this connection is the condition in which the cattle arrive in the market. It is difficult to ship from Ontario to San Francisco now. Start out with a steer in prime condition—when he arrives he is probably just good, choice, instead of being prime, and the shorter route would allow the stockmen of southern Idaho and southeastern Oregon to get their stock to the market in some condition of bloom and it should bring a better price in addition to lower cost or lower shrinkage. It is usually necessary for shippers to put their fat stock into feed lots again upon arrival at the (223) market to treat them largely as they would feeder stock to bring them up to good condition. They are either sold for slaughter or as feeders and sent out some place to be fed.

121

On page 29 you have the annual livestock slaughter in Los Angeles and Bay cities. We present this to show that there is a very large market for livestock in these places. As to whether these two markets would use the product of this section, the succeeding exhibits will indicate that, I believe. On page 30 is shown a substantial increase in the number of carlots between 1924 and 1926. Livestock is moving in substantial quantities from the territory referred to, to California markets even under the present circuitous route. It is my belief that these shipments would substantially increase via the direct route. I believe also in bringing this territory closer to California markets that in place of Nevada, Montana, and Utah shipping large quantities of sheep and beef cattle to California markets as they do now, it would bring us closer to those markets. They are closer to the Missouri Valley points, which we have to go right by them to reach. I feel that there would be a tendency for our northwest producers to utilize more and more the San Francisco and other California markets.

As to the increase in Oregon shipments between 1924 and '25, there has been a slight increase in the number of sheep in Oregon, particularly in the territory tributary to California and that probably would account for it. They have been getting up here in territory that they haven't been in before to get lambs, which is indicated this year, coming clear north up into the Heppner country. Between 1924 and '25 we have quite a substantial difference. (225.)

122

The next table shows the carloads of hogs into California by States of origin. You find that on page 31. You will notice there in that exhibit that 4,711 carloads of hogs come from Nebraska to California, from Idaho 425, from Oregon 3. As to Oregon's small number of cars shipped: Hog production is lower in Oregon than the requirements for the State itself and there would be very few cars for export. The development of irrigated lands, particularly in

Malheur County, include hog raising because of the large yields of corn there and the low cost of production, should provide hog tonnage with which to replace some of these shipments into California from other States farther east and farther distant from the California market. The table at the bottom of the page shows the carlot shipments of cattle into California by years, giving the States of origin; which again shows the volume of market and that the California market is increasing. It increased from 14,416 cars in 1922 to 19,170 cars in 1926, showing that as their population increases they must draw on sources outside the State to provide food for this increasing population.

Q. I note a substantial increase in shipments of livestock (226) from Idaho from 724 cars in 1922 to 1,632 cars in 1926. To 122½ what extent might those shipments be expected to move over the cross-State line?

A. Practically the bulk of that stuff that originates in ten southwest Idaho counties should go via the cross-State line. It would be a material advantage to them, if they go to California. They get a choice of north and south markets without increasing their distance.

On page 32 you see receipts of dressed poultry at Los Angeles by States of origin, showing that 25 per cent of it comes from California, 15 per cent from Idaho, 55 per cent from other States, 123 and 4 per cent from Oregon, showing plenty of leeway as to the increased shipments from these producing areas to California, so far as dressed poultry is concerned.

On page 33 you see the receipts of dressed poultry at San Francisco, showing that 45 per cent of the poultry received there comes from California, 14 per cent from Idaho, 6.8 per cent from Oregon, and 34.2 per cent from other States, indicating again that there is plenty of room to absorb the Oregon production. This poultry comes from such States as Illinois, Iowa, Kansas, Montana, Nebraska, and so forth.

The table at the bottom of the page shows the butter receipts at the San Francisco and Los Angeles markets for the year 1926, with points of origin: 58.8 per cent coming from California, 5.8 per cent from Oregon, 19.6 per cent from (227) Idaho, 15.8 per cent from other States. Here again is a commodity which we will produce on these irrigated lands in the eastern part of the State, the markets for which being to the west should move via this proposed line. This data shows that California is increasing its consumption of butter from outside States at the rate of 4.3 per cent per year, 1925 and '26 figures, or by 2,960,000 pounds per year.

The cheese receipts of the San Francisco and Los Angeles markets by States of origin show that 16.7 per cent comes from California, 22.8 per cent from Oregon, 26.5 per cent from Idaho, 33.8 per cent from other States; indicating again that there is a market there for increased dairy commodities to be supplied by sources closer to those sections.

On page 35 we show the increased consumption of fresh fruits or fresh vegetables, indicating that there is an increased consumption and an increased market in case transportation facilities are provided, which should enable the southern portion of western Oregon to go into this business. Carlot unloads of fresh vegetables, New
York, for instance, increased from 8,702 in 1917 to 20,164 in
124 1926, and the same increase prevailed in Chicago and Philadelphia. All these various factors have been taken into consideration in arriving at the estimates shown on page 23. (228.) And been given their proper weight. The real meat of the exhibit is in the summary.

In addition to the agricultural survey, I made a survey as to the growth of population which may be expected in the territory we are considering here. The thing that was outstanding was the increase in the consumption of agricultural commodities, the importation of agricultural commodities along the Pacific coast, particularly in California, where there has been an enormous increase in population. So the question arose in my mind what relation does this have to industrial development (229) and what part of the territory, the irrigated territory east of the Cascade Mountains, or does extension into California, have on the development of this Pacific coast country? I checked some figures on that question and found that in 1900, 46.4 per cent of the population of these Pacific Coast States resided in the cities; that by 1920, 62.4 per cent, in 20 years, resided in the cities; the agricultural population dropping from 53.6 per cent in 1900 to 37.6 per cent in 1920, and if present data were available it would show no doubt that more than two-thirds of the people in these States resided in cities. Now the population increase has been rapid during the 20-year period, 1900 to 1920; it was 130 per cent; while the urban population or city population increased 209 per cent. From 1900 to 1920 the rural population increased only 62 per cent, and this increase in the city population is greatest on or near the coast, where the increase in tillable acreage has been very small. From this
population study it shows that the great portion of our popu-
125 lation resides west of the Cascade Mountains along the coast,
and that if the rate of increase continues as it has during the past 20 years in the next 20 years, we will have 10 million people in these three Pacific Coast States, largely residing west of the Cascade Mountains (230) or its extension into California. In 1920, 77 per cent of the population resided west of the Cascades, only 23 per cent east. Now if this present growth continues and the division of population remains the same, 75 per cent of the 10 million people will reside west of the Cascade Mountains or 7,500,000. I think this indicates the need for a direct rail route from the food-producing areas, the irrigated areas east of the Cascades to the populated industrial districts west of the Cascades. Further study shows that the tillable area of land per capita in these States in 1900 was 7.9 acres; in 1920 it was 4.3 acres less than the average for the United

States, which is 5 acres per capita. Now between 1900 and 1910 improved land in these coast States increased only 18 per cent and between 1910 and 1920, 9 per cent. Between 1910 and 1920 less than two million acres of land were added, and of this less than 500,000 acres were west of the Cascades or its extension into California. Improved land in this territory increased 5 per cent, while population increased 40 per cent, as between 1910 and 1920. As already apparent, lands in this territory west of the Cascades are being used more and (231) more for the production of intensified crops, crops or enterprises which bring a higher return per acre, such as vegetables, truck crops, tree fruits, small fruits, and poultry. General farming is shrinking and will continue to shrink to smaller proportions, and the products it supplies will have to come, in a large measure, from the irrigated areas east of the Cascades. There is a unanimity of opinion that the coast is destined to be more and more industrial. One of the prerequisites of an industrial
126 center is an abundant, unfailing, relatively cheap food supply similar to that which the mid-west has. For the coast district this supply is found on the irrigated lands east of the Cascade Range. The manifestations during the past few years show that this territory is supplying food supplies in increased quantity for this increasing coast population. The proposed railroad is such a connecting link between the agricultural lands of the intermountain territory and the populous coast territory. It will shorten the route to consuming centers, and agricultural tonnage will move westward over it in increasing volume as the coast population employed in industry increases. As a result of this study, the basis of what has happened in the last 20 years will continue to happen in the next 20, increase in population, increase in industrial growth, it is apparent that a shorter route from the (232) producing areas of eastern Oregon to industrial regions of western Oregon is necessary if the development of Oregon is to be what we expect it to be. There is no reason to believe that the trend which has taken place in the last 20 years won't continue, particularly as trade develops with the Orient.

Now the actual figures as to population show that in 1900 there were 2,416,000 people in these three Pacific Coast States; in 1910, 4,192,000; in 1920, 5,566,000, and in 1927, 6,885,000, a 23 per cent increase in the last seven years. The 1927 are Bureau of Census figures. To go further and see if industrial growth was keeping pace with the increase in population, I obtained some figures from the Department of Commerce, which show that in Oregon between 1904 and 1923 wage earners increased 283 per cent and the value of manufactured products increased 555 per cent. In California also similar progress was made. Between 1904 and 1923 wage earners increased 154 per cent, and the value of manufactured products increased 502 per cent. Similar changes took place in Washington, although I haven't the figures. I have prepared a table

126½ from this data, showing the number of establishments, the manufacturing establishments in Oregon in 1904, 1909, 1914, 1919, and 1923, the number of wage earners and the value of products. The same for Eugene, Portland, and for California, and the
127 city of Los Angeles. (233.) This table shows commodities which irrigated lands produce, dairy products, potatoes, dressed poultry, beef, lamb, and hogs, will be produced in lesser quantities and this territory west of the Cascades will have to be supplied by the territory east of the Cascades on the irrigated lands.

(The statement above referred to was received in evidence, marked "Exhibit No. 2, Witness Teutsch.")

It is my judgment that there is no question but at the (234) present time there is a substantial need from the viewpoint of the agricultural development and the logical development of the State of Oregon, for a line of railroad substantially as proposed in the complaint in this case. The southeastern portion of Oregon can't develop unless it goes closer to the markets along the Pacific coast, and this railroad will provide that. I believe the urgent need will continue and increase as time goes on.

Commissioner McMANAMY. In view of the fact that the interveners are generally in support of the complaint, and their questions will be in the nature of direct examination, I think it would be well for the interveners to proceed with any questions they may have of this witness before the defendants proceed with the cross.

Mr. DUNCAN. Mr. Teutsch, in your examination as to the population statistics, did you segregate the increased population in the States of Washington, Oregon, and California to determine what the rate of increase in the past seven years has been in the three States?

A. I computed that. As I recall, it was 31 per cent in California (235), 13 per cent in Oregon, and 18 per cent in Washington.

Q. Did you make any study to determine why the rate of increase in Oregon is less than in the two States bordering it?

A. I didn't make any particular study as to that. I think transportation has something to do with it.

128 Q. Isn't it apparent from your examination into that subject that our slower growth is due to the lack of transportation facilities in the State?

A. There is no doubt but what that is one of the contributing factors.

(Cross-examination of Mr. Teutsch deferred until later in order to convenience out of town people who are anxious to testify and leave the city.) (236.)

JOHN G. MULLEN was thereupon called as a witness on behalf of complainants, and, having been duly sworn, testified as follows:

Direct examination:

I am an attorney and have resided at Nort Bend in Coos County, in the southwestern part of the State, for approximately 20 years,

during which time I have become familiar with the products and industries of Coos and Curry Counties to quite a large extent; and in a general way familiar with the transportation needs of that section. (237.) At this hearing I represent the county court of Coos County and the Coos County Chamber of Commerce, its membership consisting of the individual members in the Marshfield, Bandon, Myrtle Point. Coquille and North Bend Chambers of Commerce. Both the county court and chamber of commerce are interveners in this case. Coos and Curry Counties are the two southwestern counties in this State and they border on the west on the Pacific coast. Population, approximately 30,000. The main industries are lumbering, the manufacture of lumber products, dairying, fishing, and coal mining. Perhaps the best harbor between Portland and San Francisco is at Coos Bay in this district. About a year from now the Federal Government will (238) have finished the construction of jetties at a cost of over three million dollars. When this work is completed boats of any capacity can enter and leave under full load. The lumber is manufac-
129 tured, and during recent years there has been a considerable increase in what might be termed the remanufacturing business. Several veneer plants have begun operations. These plants manufacture to a large extent what is known as blanks for batteries, which are shipped to the automobile centers of the United States. The Venetian blind business—there are manufactories in that line in recent years. It is only within the past few years that there were any planing mills on Coos Bay, and that class of lumber is shipped to quite a large extent by rail, remanufactured lumber.

The deep-sea fishing industry, with the improvement of the harbor work, has increased very materially and will continue to increase with adequate transportation facilities east. Fishing boats that formerly went to the Columbia River and Seattle and San Francisco now do and can come to Coos Bay to unload fish caught in the ocean. Halibut and salmon are the kinds of fish mainly caught and shipped from that point. There are other kinds and varieties. (239.) As to the shipping fleet operating out of Coos Bay, there is a witness here who could give that information better than I can, but I would say that it has more than doubled and trebled in the last five years.

There are also vast quantities of wood suitable for pulp and paper purposes and while there is no pulp or paper mill as yet in southwestern Oregon, there are one or two prospective mills in sight.

The geology surveys of the United States show there are vast quantities of coal deposits in southwestern Oregon that are not being used to any very great extent. There is in process of organization a coal distillation plant to be located on Coos Bay, with a minimum capacity of 500 tons per day. If that should prove successful it would create a great deal of tonnage from southwestern Oregon.

It is estimated that there are approximately 30 billion feet of standing timber in the county, and I don't know what the estimate of Curry would be considerably less. A great deal of the timber
130 is owned by the Federal Government. There is a large percentage of it that is now matured and ready for market. (240.) I understand a large percentage is overripe and deteriorating for lack of being cut. To get a shorter and more direct route to the markets of the East and the Middle West and, if possible, competitive railroads in our territory is the primary interest of our community in this railroad construction plan. Our traffic now moves to eastern destination via the Southern Pacific which has its branch line from Eugene to Coos Bay and extending south from Coos Bay to Myrtle Point. That is our only railroad connection with the outside world. The branch of the Southern Pacific serves the entire county as much as one railroad through a county can serve. It runs to Powers by logging road. Powers is almost in the southern part of the county. It runs north and south fairly near to the coast, bordering the coast until it gets to Coos Bay and from there it has a tendency to go inland from Coquille. (241.) In the northern half of the county there are large areas on the eastern side of the county that are not reached by the Coos Bay branch. In the southern half of the county there is nothing on the coast. Curry County has no rail connection at all.

Our distance to eastern and middle western markets would be reduced over 400 miles by the line proposed in this case and something over 200 miles if the Alturas cut-off is completed. There has been only a slight development of our natural resources up to the present time. We have unlimited possibilities awaiting development; it is my opinion that this development would be fostered and aided substantially by a shorter route east and by the possibility of rail competition. (242.)

131 Cross-examination:

The Southern Pacific Company's Coos Bay branch has been in operation since 1916 and our community is served by it. In the past it has had the capacity for handling all the traffic offered from our section and more. I believe that we need more railroads because the proposed route would shorten the distance east. As to my statement that we want railroad competition, we hope that will result from the construction of this proposed line from Crane to Crescent Lake. (243.) I don't know that there is any definite plan for securing this competition; if the Union Pacific should build to Crescent Lake, it might find an outlet to the coast. We anticipate if the Union Pacific came across to Crescent Lake it might later extend over into Coos County.

I have made no investigation so that I am not in position to testify as to the percentage of lumber products that move by water and by rail. We believe that as the supply depletes in Michigan and Wis-

consin and Minnesota territory and the South—there will be a greater demand in the central part of the United States for our timber, which would then be shipped by rail. I understand that the Alturas line will be promptly constructed and our lumber shipments moving to the East by rail and taking that route would have only about 200 miles farther to move than they would over the cross-State line (244); this extra 200 miles isn't as serious with lumber as it would be with fish and perishable products. Lumber is our principal resource; outside of some fish business which we hope to develop, we expect to move in quantities from Coos and Curry Counties perishable products like broccoli, lettuce, small fruits. We have raised very little lettuce in that territory in the past for shipment, but experiments have been made and proven reasonably successful. I understand the climatic and soil conditions are considered favorable by producers. I understand broccoli experts have investigated and there is one reason why they favor that as a broccoli
132 territory (245), because it can produce at a season of the year when other broccoli producing territories like California and Douglas County haven't grown the matured plant. (246.)

(For convenience a map of Oregon was received in evidence and marked "Defendants' Exhibit 5.")

Q. And you understand, do you, that the line proposed is indicated on this map in solid yellow, extending from a point five miles west of Crane, on the so-called Oregon eastern branch of the Oregon-Washington Railroad & Navigation Company, and thence across the State, across the line of the Great Northern Railroad, and to a connection with the Southern Pacific, or Central Pacific line of the Southern Pacific, at Crescent Lake? You understand that location and that connection, do you? (247.)

A. Yes.

Q. Now, that connection is well up on the east slope of the Cascade Mountains—that is true, isn't it? Crescent Lake?

A. I think so; yes.

Q. Yes. So to proceed to your country it would be necessary to climb the Cascade Range somewhere, wouldn't it, in some manner, if the Oregon-Washington Railroad & Navigation Company is to proceed into that territory?

A. Yes, sir.

Q. Now, after it has done so, and assuming that it does reach Eugene or some other point—no, after it has done so, what would be its objective intervening between Coos County and Crescent Lake? Have you any notion on that, what route you have in mind?

A. None whatever, unless the old so-called Harriman survey.

Q. Well, the old so-called Harriman survey, known as the Oregon Eastern Railway, extended from Natron, near Eugene, clear
133 across the State to Ontario Junction, at Ontario. Now, it was cut in two by the decision divesting the Southern Pacific—its control was cut in two by the requirement that the Union

Pacific divest itself of its Southern Pacific stock holdings; you understand that?

A. Yes. (248.)

Q. And that left this line terminating, this line of the Oregon-Washington Railroad & Navigation Company, at Odell Junction. Now, it is projected on west some thirteen or fourteen miles to Crescent Lake, and I understand you to say that your country is interested in competitive operation, is that true?

A. It is.

Q. Now, you don't get a competitive operation if the line terminates at Crescent Lake, do you?

A. Unless you come in under common user over the Southern Pacific lines.

Q. Well, if the Southern Pacific would extend common user privileges there would be ample railroad constructed from Crescent Lake clear around to Marshfield, wouldn't there?

A. Yes, sir.

Q. That is a very expensive construction, isn't it, most of the way?

A. I would judge it is.

Q. Yes; and any other route whereby the Oregon-Washington Railroad & Navigation Company could reach Coos or Curry would be very expensive in construction, wouldn't it?

A. I would think so, most of it. (249.) It is rough country and it would be necessary to climb the Cascade Mountains and again climb the Coast Range of mountains; we are west of the range; we are on the coast. The line terminating at Crescent Lake would serve Coos County or Curry County only by transfer of freight from the Southern Pacific at the junction to the cross-State road.

134

Q. Well, now, how far is it from Curry County, down here at Gold Beach, say, at the mouth of the Rogue, how far would it be by any route to get up here to Crescent Lake, where this line connects with the Southern Pacific?

A. I don't think it logical for a railroad to build clear down to Gold Beach. It is about a hundred miles from Gold Beach to Coos Bay over the traveled road. (250.) I think it is 122 miles from Marshfield, on Coos Bay via the Southern Pacifiic, to Eugene. I don't know how far it is from Eugene to Crescent Lake.

Q. About another hundred miles. Now, there would be 322 miles. Now, your country, Curry and Coos Counties, enjoy for their greatest resource lumber, don't they?

A. They do.

Q. And you are the biggest offshore shippers of any manufacturing location in the State, isn't that true, of lumber, at Marshfield?

A. We are large shippers, but I wouldn't say we are the largest. We do not ship practically all mill products by water. The veneer

plants ship largely by rail. (251.) We ship some lumber as lumber both by water and by rail.

Our agricultural area is very limited but it is very productive; they are bottom lands on the rivers and various sloughs. According to Government agricultural census of 1925, Coos County has 21,017 acres and Curry, 7,015.

Q. Now, you wouldn't expect a big major railroad construction for a limited agricultural operation of that kind, would you?

A. That will be greatly increased.

Q. Well, can it be very greatly increased? You are lim-
135 ited (252) in your area there, are you not?

A. We are limited in our area. There is probably about a third of the available bottom lands that are now utilized, I would say. There are a lot of them not in agricultural use that won't need any diking or drainage.

Interchange would be a big help. Competitive service would be better. All of the cities on the Pacific coast that have competitive service have grown very rapidly, have gone ahead, while Coos Bay hasn't gone ahead very rapidly. (253.)

It is approximately correct that lumber goes over 400 miles out of direct line in order to get east now on the route it takes down to Roseville. I did know that during that time the Portland gateway has been open, with a joint rate with the Southern Pacific whereby they could ship from Marshfield through that route and east. I didn't know that to Granger, Wyo., with that line as it is, it is some hundred and forty odd miles shorter than the Klamath Falls-Alturas line. It probably isn't the shipper's fault that that route hasn't been used; it may be due to regulations of the carriers. The regulation I have in mind is that the Southern Pacific is the only road that is serving our territory. (254.) I don't know what the arrangements are between the Southern Pacific and the Union Pacific for the transfer from the Southern Pacific to the Union Pacific at Portland.

Q. (By Mr. SPENCER.) Now, if it turns out that the Oregon-Washington Railroad & Navigation Company concedes to the Southern Pacific 25 per cent of the entire rate to Missouri River if it will deliver lumber to it at Portland from the valley, which division exceeds to a considerable extent the local charge of the Southern Pacific, or the local rate, and you still haven't used that line, why should you expect that your shippers over there would use the cross-State line at Crescent Lake?

136 A. It would be somewhat shorter. I don't think a difference of 60 or 70 miles would cut very much figure in the movement of lumber to Chicago.

Q. And you would be just as bad off and just as much disappointed as anybody could be if this line was built across here from Harriman to Crescent Lake and stopped there indefinitely, wouldn't you?

A. I think that there are other matters, other commodities, that would use this besides lumber. It would make it possible (255) for the dairy men of Coos County to get the eastern Oregon feed, or grain and hay.

Q. Well, now, don't you know that western Oregon alfalfa is on the market for sale right now?

A. I don't think that it has been grown very successfully in southwestern Oregon. I have talked with the county agricultural agent.

Q. And you think that serious consideration should be given to the building of a line from Crane and Harney Valley in order that alfalfa might be moved into Coos Bay, where the total acreage in cultivation is twenty-one thousand?

A. I think that is one thing that would have considerable bearing. I couldn't tell you whether Oregon raises much alfalfa in the Rogue River Valley, on the Southern Pacific; I understand it raises alfalfa in large quantities in the Klamath Basin but that it doesn't raise it in sufficient quantities to supply the dairy men of Coos County in the Klamath Basin. Our county agent told me that. (256.)

Q. So that the lumber isn't of so much importance; it is just a question of getting some alfalfa over there to the dairy men of Coos County; is that the way you wish to be understood?

A. I wish to be understood that everything taken together, the dairying, the lumbering, and, as time goes on there is going to be more and more finished lumber for shipment east. Recently
137 there was opened in Marshfield a furniture factory, the first furniture factory in southwestern Oregon, and as the years come the lumber products are going to be manufactured into finished products that will increase vastly the rail shipments, rather than water shipments.

Redirect examination.

In addition to the lumber being shipped out as lumber, there are a great many specialty factories producing battery separators, and manufactured products of that kind, that do require expeditious transportation to eastern markets. Some of the specialty factories make specialties, like rulers and measuring sticks (257), and various wooden novelties; there are at least three small myrtle wood factories in the county that manufacture myrtle wood into what they term novelties and those are shipped various places. There must be four or five factories manufacturing battery separators. There are three at Marshfield, and I think there is a small one at Coquille, and there is one at Bandon. And there are box factories, or factories manufacturing box materials. Some of those plants make boxes out of veneering, battery boxes and boxes of that description, and we have a plant, not in operation now, that makes regular sawed boxes. These articles, especially the battery separators, are of high value. The matter of expeditious handling is an important consideration, because these products run about $8,000 a car (258) and the quicker

you can get that stuff to market and returns on it the better for the shipper, the owner.

It is our sincere hope that a line constructed as proposed in this complaint would eventually be extended through to the coast, to Coos Bay. In the meantime, we believe that the connection over the Natron cut off would provide a shorter route than we now have and would be a value to us and an aid in developing our port. (259.)

137½ C. F. MAGINNIS was thereupon produced as a witness on behalf of complainant and, having been first duly sworn, testified as follows:

Direct examination:

I am port manager and engineer of the Port of Coos Bay. I have been in that position nearly a year. I reside at Marshfield. I am familiar with the Port of Coos Bay. I have prepared a statement to read into this record outlining the port facilities. It so happens that I wrote an article, which was published last week in the Coos Bay Times, on this subject. That article concisely describes the Port of Coos Bay and its facilities. It is a concise report (260) and I will read it:

"Following is an extract from the report of Major General Edgar Jadwin, chief of engineers, made to the Secretary of War, December 10, 1927:

"'The area tributary to Coos Bay and the large expenditures which have been made by the Federal Government for harbor improvement have made Coos Bay the most important harbor between the mouth of the Columbia River and the waters of San Francisco Bay.'"

138 "Coos Bay is 365 miles north from San Francisco and 300 miles south, by water, from Portland. It is therefore practically equidistant from those two great ports. Aside from the importance of its geographic location, which alone warrants greater expenditure of funds than will prove necessary to its ultimate development, it is endowed by nature with other peculiar advantages which make it responsive to the works of man and insure its purpose as an artery of the Nation's domestic and foreign trade.

"The entrance to Coos Bay is a single range (or course) which is at right angles to the seas—when seas make during rough weather. The distance from the inner harbor to 'deep water' at sea is short compared with other harbors. The jetties at the entrance, now nearing completion, are making deep water of this short space and are also effecting a width (261) of such deep water to limits which safeguard navigation over the 'bar.' Natural features of the coast line are prominent and form advantageous angles for the true orientation of a vessel about to cross in. An incoming vessel is in calm water immediately upon entering the port. There are good anchorage grounds outside, north of the entrance, and close to it. There

is good anchorage inside in the lower bay, capable of further
139 improvement at small cost. The inner channel carries a natural depth of more than 25 feet of mean lower low water throughout a large percentage of the distance from the upper bay to the bell buoy. Not an inconsiderable portion of the inner channel carries more than 30 feet. Our present project depth is 22 feet"—controlling depth—"at low water. The matter of increase to 25 feet and later, when conditions require, to 30 feet at mean lower low water, will not require a large expenditure of money.

"The average high tide, for the year, in the upper bay is 6 feet above mean lower low water. Extreme range of time about 10 feet. Not so great as to create velocity of tidal currents difficult to cope within the management of vessels, but great enough, by reason of the sufficient area of the bay and its arms, to produce a tidal volume effective in scouring the channel in its ebb and flow. The bay is not afflicted with shifting of shoals from one part to another, and Coos River, the only stream of importance entering the bay, does not (262) carry down for deposit an amount of silt sufficient to cause a high cost of dredging in channel maintenance.

"Coos Bay has responded in the past to each effort towards its improvement and has no physical defect or other fault of comparative importance which can act as a bar to its future development.

"The port is well equipped to handle lumber and other freight leaving or entering. Seven of its docks have rail connections. Three docks have warehouses for storage of public freight. Two are equipped with locomotive cranes. One, a private dock, has electric overhanging cranes for rapid handling of its lumber. One is provided with a shear leg derrick for handling extra heavy freight from vessel to dock or vice versa. In addition there are log dumps, pri-
vate and public, and booms where logs may be stored
140 at reasonable rates while awaiting shipment. Three oil companies have plants located on the water front. There are two foundaries with machine shops, numerous other machine shops and welding plants carrying men skilled in every kind of work and a shipyard where any kind of repairs or supplies may be secured.

"The port district owns one-half mile of water front between North Bend and Marshfield. Its dock is 1,100 feet long, is equipped with a locomotive crane and other handling devices, trackage for 70 freight cars, and a log dump with booms conveniently arranged with pockets and runways for storage of (263) 10,000,000 feet of logs. The port dock and booms are for the convenience of shippers operating outside of Coos Bay. Handling rates in effect for use of port facilities have been lower than at other Pacific coast ports, as it has been the policy of the port commission to offer every encouragement to shippers in order to assist them in meeting conditions of the lumber market during the last few years.

"It is estimated that there is 176,000,000,000 feet of timber in southwestern Oregon, 40 per cent of which is owned by the Fed-

eral Government; 55,000,000,000 feet, 20,000,000,000 feet of which is still in Government ownership, stands on territory directly tributary to Coos Bay. Our representatives at Wasington have succeeded in convincing the Government that the improvement of Coos Bay is good business since better shipping conditions reflect increased valuation of Government owned as well as private owned timber. This has been proven by the appreciation of the Government's holdings in Coos Bay district since the construction of the jetties began, and foreign markets have been opened to our industries. We are now assured of a further improvement to the harbor in the
141 removal of a reef in the lower bay, near Pigeon Point. This is the last step of major importance towards the development of the port. Its accomplishment will enable us to load foreign and east U. S. coast vessels to capacity and thus open greater market to our products at lesser costs. Better (264) shipping conditions will offer inducement to the building of other railroad lines into the district. Imports may be looked for as well as exports and we may offer the service of our port to shippers over an extended interior territory, as we will be able to show them that they can ship through Coos Bay to greater advantage than through other ports.

"There are available sites on the Bay for large or small industries seeking rail and water connections. A railroad on the east side would open a large expanse of territory and waterfront and offer additional sites. Future growth will not be limited by lack of space. The port commissioners have profited from the experience of other ports which discovered too late in their stage of development that docks and other structures were so located as to prevent the expansion of the waterways to meet changing conditions. We have successfully petitioned the War Department to set our harbor lines back to such extent as to provide ample area for fairways and future turning and anchorage basins. Coos Bay has all the possibilities of a great world harbor without the necessity, in comparison with the requirements of other harbors, of great expenditure of funds. We have the additional advantage that constant betterment of the bay adds to the value of Government timber in the port district and makes 'Uncle Sam' a partner in our enterprise. Each increase of $1.00 per thousand feet in timber directly tributary
142 to the (265) bay adds $20,000,000 valuation to Government holdings in that district. It is conservative to state that $1.00 increase per thousand feet has resulted from improved water conditions during the last five years. It may reasonably be expected that the Federal Government will continue to assist the development of Coos bay and share in her prosperity."

As to the width of the bar at the harbor entrance; the jetties being constructed now, and which will be completed by next July, are 2,100 feet apart, the north and south jetties. The south jetty extends 4,300 feet out from Coos Head, the cape at the south of the entrance and the north jetty is longer, but the two jetties go to the same dis-

tance seaward. As to the number of miles of shore line available for docks and other harbor facilities: There are at present established by the Government approximately 10 miles in the upper bay only. This could be doubled and is arranged for future extension without going out of the upper bay district into any of the inlets or Coos River or without considering what we call the lower bay down near Empire. It would be possible to increase the mileage for dock space and industries to 50 or 60 miles, without including part of one side of the bay. (266.)

As to fog conditions on Coos Bay as compared with other Pacific coast ports: It is my understanding that the fog conditions are less than at some other ports and particularly less than San Francisco. It has been stated and not disputed that Coos Bay is closer to the Orient than any of the Pacific coast ports.

As to what statistics, if any, I have available, showing the cargo movement through the port of Coos Bay, I have listed here in this publication the names and number of vessels that have cleared for foreign or United States east coast ports since 1922, and in-
143 cluding 1927. Now it also shows the flag, the tonnage and the draft of vessels. I will describe briefly, in round numbers, the increase that has taken place in the shipping through Coos Bay over a period of years. Our foreign shipping really began the latter part of 1921. In 1922 there were 16 foreign vessels and 8 Atlantic coast vessels, carrying, respectively, 25,000,000 and 17,000,000 feet of lumber (267). In '23 there were 49 foreign vessels, 9 Atlantic coast vessels, carrying, respectively, 19,000,000 feet and 21,000,000 feet. In '24 there were 46 foreign and 14 Atlantic coast vessels, carrying, respectively, approximately 84,000,000 and 16,000,000. In '25 there were 37 foreign, 15 Atlantic coast vessels, carrying 64,000,000 and 19,000,000 feet, respectively. In '26, 40 foreign and 10 Atlantic coast vessels, carrying, respectively, 67,000,000 and 13,000,000 feet. In '27, 31 foreign and 9 Atlantic coast vessels carrying 63,000,000 and 10,000,000 feet, respectively. (268.) This year the number of vessels and their cargoes will exceed very considerably, last year. I haven't, however, any data on them, other than the fact that I know that we are getting more vessels in the harbor and they are taking good cargoes out. These cargoes move very largely to Japan and to Chile, Australia, China, and (269) I believe one cargo for England. I didn't state what proportion moved as lumber and what as logs or Jap squares. The figures I gave included the footage for logs and lumber.

(Said pamphlet, entitled "Coos Bay, Oregon," was thereupon received in evidence, and marked "Complainant's Exhibit No. 4, Witness Maginnis," and is forwarded herewith.)

Almost in every instance those boats come to Coos Bay empty; that applies particularly as to the foreign vessels. I wouldn't say that in regard to the U. S. east coast vessels. The coastwise
144 vessels and those operating between the Pacific and the At-

lantic coast do not always come empty; (270) sometimes they have a small cargo. As to whether we have in prospect any cargo which might be developed to load these empty ships, up to a recent action of the district engineer and the chief of engineers we were not able to load vessels to full capacity because there was an obstacle in the harbor which prevented their loading to sufficient depth. Until we got that out we didn't make any efforts to secure imports or to turn the freight from further east in this country towards Coos Bay, because we couldn't offer them any greater advantage at Coos Bay than they could secure at Portland or some other port, so there has been no attempt to secure incoming freight. Those difficulties have been taken care of. The last improvement of major importance that we will need is the removal of a reef in the lower bay at Pigeon Point, about 2 miles below Empire and that has been approved by the district engineer, the chief of engineers, the board of engineers, and by the rivers and harbors committee, but it has not yet been passed in the rivers and harbors (271) bill because the bill was not brought up at the last session of Congress.

As to the importance of the proposed construction of the east and west line to the development of Coos Bay, it could open up a new country in entering the bay proper, and open up new market to the products of the bay, a more direct market.

Q. Would the saving of 400 miles in distance to Middle West and eastern sections of the country be of any assistance in bringing cargoes from the Orient through your port?

A. I should say it would.

Q. Well, are there such cargoes to be developed, and that might be developed, with proper and direct rail transportation service through your port?

A. Certainly. It would tend to it.

144½ Q. Is there any reason why your port couldn't handle the cargoes of silk and other cargoes now moving from the Orient through other ports of the Pacific coast?

A. There is no reason why we shouldn't prepare to handle them if we could have as advantageous rail connections to ship them out of the district.

Q. Do you think that the providing of competitive rail (272) facilities at your ports will be of ultimate advantage, also?

A. Undoubtedly.

The Government will have spent in the vicinity of Coos Bay approximately six million dollars by the end of next July. In addition to that, the port has spent nearly one million. The figures I have given for the Government run back to about 1890. The present project of jetty work is costing three and a quarter million—it was begun in 1924 and will be completed next year. Outside of the entrance to Coos Bay there are no rocks, there is no menace to navigation for vessels bound either to the Orient or the north or the west, as a matter of fact, in any direction. (273.)

145 Cross-examination:

We have good railroad service. We have been unable to develop any tonnage because we have no peculiar advantage to offer. The large vessels that have been coming into Coos Bay up to the present time have had to go to some other port to finish off their load, so there wasn't any special reason why a foreign vessel would discharge its imports at Coos Bay and then go up to Portland or some port on the Columbia and finish off a load. I don't believe the Southern Pacific has maintained the same rates on all traffic from the east into Coos Bay that it maintains to Portland so very long. (274.)

A. I think that condition hasn't existed so long, has it?

Q. Since 1924? Four years?

A. Possibly as long as that.

Q. But even with that having been done for the purpose of stimulating some export business moving through the port there, no favorable result has been had?

A. We haven't any regular line running to Coos Bay. I mean we have no regular scheduled line of vessels coming from foreign ports to Coos Bay.

Q. The Southern Pacific is building a new railroad from Klamath Falls through Alturas to a connection with the Central Pacific in Nevada, and when it is finished, which we expect will be about next May, there will only be a difference of about 200 miles between that line and the line that is being asked for in this proceeding; and do you think the destiny of Coos Bay for the purpose of handling export and import business is going to turn upon that?

A. Upon a matter of 200 miles?

Q. Yes. (275.)

No; but I think the destiny of any port is dependent upon more than the service of one railroad for its ultimate development and

146 I believe the port of Coos Bay is going to be among the greatest ports on the West coast; I think the water conditions are there, or whether the cross-State line builds or whether any railroads are there or not that it would be possible to develop the water so as to handle vessels, but there would be no incentive to do so, and I don't believe that any great port is built without the service of more than one railroad in more than one direction, and I don't pretend to be any sort of railroad expert and I haven't really given this matter a great deal of study. (276.)

Q. (By Mr. SPENCER.) Why, captain, you mentioned the fact that there was considerable industrial frontage available on the west side of the bay for railroad development and service there, and accommodation of railroad facilities.

A. I don't know that I said that, but that is so.

Q. Well, I got that notion from your mention of the west side. Which side of the bay is now served by railroad?

A. The west side.

Q. If another railroad were to enter the Coos Bay country and Marshfield which side could it enter?

A. It could enter the east side. There is not a great deal of business there now. I would say that no port can expect or aspire to be a prominent port without the service of more than one railroad reaching in more than one direction.

Q. Now, you know that it is proposed to take this railroad (277) across the desert and stop it at a connection with the Southern Pacific from the easterly slope of the Cascade Mountains at a place called Crescent Lake. How will that assist in solving your problem over there, to obtain competitive service and bring you to that objective that you so much aspire to, to have service by more than one railroad?

A. It will be a step in that direction, will it not?

147 Q. You mean that we will have built half way across—and what do you mean by that?

A. When you have built half way across you will be that much closer to Coos Bay. We will invite you then to come on in.

Q. And you figure that if we get a hundred and ninety miles or so more of rail mileage exposed to the weather that we will come down into the coast range, where there is plenty of timber and moisture, is that it?

A. I hope you will. The Government has a lot of timber down there. They have been selling it right along. (278.)

Q. It is restricted in the cut so that the operation may be perpetual, is it not? An absolute, determined, fixed policy of the forestry department?

A. I really don't know.

Q. You don't know that? But you have heard, or know, or state, in any event, that the improvement of the facilities over there increased the value of the stumpage a dollar a thousand; is that right?

A. I stated that it is conservative to state that, yes.

Q. And would the building of another railroad in there add a dollar a thousand to that stumpage over there?

A. I didn't say so, but I believe that it would add to its value, probably, in a very substantial way. (279.) I have been actively administering the port and have conducted and carried on the loadings. There has been very little interchange between ship and rail.

Q. Now, I noted in the summary you dictated into the record from Exhibit 4 you have referred to the off-shore and to the intercoastal shipments, year by year, but following the recapitulation of same there appears coastwise shipments for the years '25, '26,

148 and '27. Those coastwise shipments constitute the large output of the Coos Bay mills, do they not?

A. Have up to date, as compared with foreign shipments by water and with intercoastal.

Q. And as compared with by rail—you know that, don't you?

A. I know that. But I haven't the figure on rail. (280.)

Q. Well, there haven't been so many cars over that they blinded you at all by number, have there, moving out? Over 90 per cent of your output is by water, isn't it?

A. I don't know.

Q. And, as a matter of fact, you wouldn't have to be an expert to know that a terminus over here at Crescent Lake, on the other side of the Cascade Mountains, which is 28 miles nearer your wharves than Portland, wouldn't serve you any better than a good railroad that is now operated on a water level grade from Coos Bay all the way to Portland, and from Portland all the way up to the Blue Mountains; isn't that reasonable?

A. You are assuming that that will be the permanent status of it, as you describe it now?

Q. Yes.

A. Well, probably that is reasonable, yes.

Q. And, as a matter of fact, your Portland connection would be infinitely better, because loads will come in there and the empties will be available there; that is true, isn't it? Sounds reasonable? Portland is the metropolis and the large center and the industrial center of this part of the country, isn't it?

A. Yes; the loads come in there in the cars hauled in by the railroads. (281.) They are made empty there. The empties are
149 used in shipping out. We wouldn't get any empties up there at Crescent Lake on a cold night that froze over. I came here to talk about the Port of Coos Bay. (282.) We have men more expert than I am to talk about the relation of Port of Coos Bay to a cross-State line.

Exam. ROGERS. Did you say that there was no interchange between rail and water at Coos Bay at the present time?

A. He said between ship and rail.

Exam. ROGERS. Yes; well, where do these vessels get their tonnage?

A. I took because he said from ship to rail, I took it that he was speaking of imports.

Exam. ROGERS. Well, was your answer confined to imports?

A. It was in that answer; yes. The tonnage came from the rail to ship. It came largely from Coos Bay. Some comes by water from Coquille River, around up out of the mouth of the Coquille and into Coos Bay. Some comes up from Port Oxford by water, but most of it comes (283) to Coos Bay by rail.

Q. (By Mr. DEY.) These mills there load direct from the mill onto the boat, don't they? The Coos Bay Lumber Company?

A. Yes.

Q. Which is by far the biggest one you have? Probably the biggest mill in Oregon?

A. Yes.

Q. And the other smaller mills do the same thing, do they not?

A. But the logs, the cedar logs, nearly all come into Coos Bay by rail.

Q. Yes.

150 A. They are unloaded at the port dock, or at another private dock, into the water, and then carried around to the side of the vessel and loaded overside.

Q. There is one thing you might give us some information on, captain, that would be helpful. How far back are they going now from Marshfield, or from the location of your principal mills, to get their logs?

A. They go quite a distance for cedar, cedar logs. Possibly as much as 15, or even 20 miles from the railroad. The cedar only. Not the fir. They are logging fir for the Coos Bay Lumber Company up around Powers now. I suppose it is 50 or 60 miles from the mill. (284.) I believe they haul it into their mill over their own railroad. They have some sort of an understanding with the Southern Pacific. I don't know what it is. The Southern Pacific uses that railroad for some service beyond Marshfield, but it is actually owned by the Coos Bay Lumber Company. The Southern Pacific does not enter Coos Bay over the rails of the lumber company. This is beyond Coos Bay from Eugene. (285.)

H. S. HALE was thereupon produced as a witness on behalf of complainants, and, having been first duly sworn, testified as follows:

Direct examination:

I reside at Coquille, in Coos County. I am county agricultural agent. I have held that position since a year ago in March. Previously I was engaged on the Smith-Hughes agricultural work for a while, and then going to school at O. A. C. before that. Before that on a farm in Clackamas County. As agricultural agent my work is in extension service; represents the U. S. Department

151 of Agriculture and Oregon State Agricultural College. I have made a study of the agricultural production of Coos County at the present time and its potential possibilities for production. My study discloses (286) as to Coos and Curry Counties together:

Coos and Curry Counties are located in the southwestern part of Oregon, and it will kind of be necessary to give you a little description of the climate to understand their agriculture. They have an annual rainfall of around sixty inches. Most of it comes during the winter months; practically no freezing weather; rarely ever have snow. Last year, I know, 29 was the lowest temperature in the winter. And the grass is green there, the cows on pasture through the entire winter. And the summers are rarely warm; this year, so far, 76 has been the hottest we have had. So with those conditions dairying and several other farm enterprises are the major enterprises.

Dairying: Dairying is the major enterprise at the present time. because of the pasture conditions that we have and the mild climate.

heavy production of forage crops. In Coos and Curry Counties at the present time, I estimate, there is around 15,000 dairy cows. According to the 1925 census there were 13,700, but there has been quite an increase since then, an increase that is going on rather rapidly. These 15,000 cows produce milk which went into 3,800,000 pounds of cheese in 1927, and 1,038,000 pounds of butter. (287.)

At the present time the big drawback, or the major requirement to further dairying in this coast section, is to get a cheap source of hay, or a cheaper supply than we have at the present time, and a more adequate supply. The hay that is harvested on the
152 farms in Coos County at the present time is of inferior quality compared with the alfalfa hay grown east of the mountains, because it is grass hay, and our weather conditions for curing hay are not ideal because of the dampness, foggy weather, and we don't have hot sunshine or drying weather. This hay that is cured there, as I say, is not good quality and is about half the value of the alfalfa properly cured and grown in the irrigated sections. Alfalfa is recognized as the best hay for dairy cattle, for the production of milk, and these irrigation projects in the eastern part of the State, or in the middle part of the State, can produce alfalfa and sell it at around 10 to 12 dollars on the cars, and, if we could get that into Coos Bay at from 16 to 20 dollars a ton, then the farmers could afford not to raise any hay at all, but use all of their land for pasture purposes, for which it is best suited. By using it for pasture they could—their gross income would be materially increased, because from our records of the cow-testing associations, of which we have three in Coos County, including close to 3,000 cows, the gross income per cow was $164.00 and approximately 90 per cent of that is (288) produced from pasture, because the cow is in pasture from in April until the latter part of October, and that is the season that the heavy production is on. The most of the cows, practically all of them, freshen in the latter part of February, March, April, and May, and during the winter months, or about six weeks to two months during the winter, December and January, are dry and do not require the feed at that time that they do when they are milking. About
90 per cent of this milk is produced while they are on pasture,
153 and 90 per cent out of the gross income of $164.00 is $147.60 which is produced from an acre of pasture, because we figure that one acre of pasture there will carry a cow, and under some circumstances we are pasturing two cows to the acre, but the average is, at the present time, one cow to the acre; but from hay the average production of hay is around three tons; which is valued at $12 for the grass hay, and the land that is used for hay is also used for pasture in the early spring and after the hay is cut off, so we figure that the pasture and the hay makes a total value received from that land of $78.00, compared with the value of $147.60 produced by the cow when she is on pasture there. By those figures it shows that using all of this

land for pasture, and not using it for hay, as is done at the present time, why, the dairy production could be increased, the number of cows could be increased by at least 3,750, figuring (289) that just half the dairymen adopt this policy, and it is the opinion of most of the dairymen in the coast section if they can buy hay, good alfalfa hay, at anything like a reasonable price they will not grow any hay of their own. At the present time the retail price for good alfalfa hay has been from $22.00 to $25.00 a ton. Some of that comes from Stanfield on the Union Pacific, along the Columbia River. And some comes from Klamath Falls, some comes from southern Oregon, and a little from the Willamette Valley. There is an adequate supply available at nearby points in the Willamette Valley, or in the Klamath territory, at the price it is selling. The larger the supply, naturally, the cheaper the price would be.

154 I do not know the extent to which alfalfa is produced in the Willamette Valley and in Klamath County. But I know the dairymen—and tests have (290) proven the same—that hay produced in the Willamette Valley is inferior to hay produced in eastern Oregon. The dairyman will pay four or five dollars more a ton for that hay than he will for the Willamette Valley hay.

If the line were built, it should reduce the cost of hay, because it will open up a new field, new source of supply. The Ochoco project was a failure, and one of the reasons was the lack of market for the hay. The greater supply, due to the increased acreage, would be one cause of decrease in the cost of hay, and the more direct route. The freight rate should not be as much as it is from Stanfield, and there is some hay shipped in from Stanfield at the present time. Some even comes from eastern Washington. Some comes from the Yakima district and even east of there, that alfalfa section; I forget the name of it.

I do not know the freight rates paid on shipments from the eastern Oregon and eastern Washington shipping points. (291.)

This using of hay from eastern Oregon and utilizing the pasture for dairying, or utilizing the land for pasture, would give us an increase of 3,750 acres for pasture, and, figuring a cow to the acre, it would give us that many more cows. And then, aside from this increase, there is a rapid increase due to increase in the carrying capacity of the pastures by new crops and better methods of seeding. We have the Lodino clover that is increasing the carrying capacity of the higher pastures, and Reeds canary grass for the lower

155 pastures. Either one of these crops will carry easily two cows to the acre.

Then there is in the neighborhood of three thousand acres of land going into drainage districts to be drained and diked, which is not being used at the present time. This will be a further increase. This land that is to be drained and diked is ideal land for canary grass. Reeds canary grass will carry, as I said before, two cows to the acre. Those 3,000 acres should, by buying hay from the out-

side, support 6,000 cows, which would, instead of giving Curry County at the present time (292) around 15,000 cows, it would make it nearer 25,000.

Q. You think such a result could be brought about largely by the construction of a line into the alfalfa districts of eastern and central Oregon?

A. The cheaper buying of hay should help to bring this about—and southwestern Idaho as well.

In addition to the hay requirements needed, we need to ship in from other sections of the country other feeds. Mill feeds and corn are being used in Coos County more than formerly, and used profitably. We have run several tests on them and find that they can make $3.00 for every dollar's worth of corn they feed the cows, up to a certain limit, and the corn can be used. There is need of corn there, and other mill feed to fatten off hogs that are raised on the by-products of dairying. We have the whey from cheese factories, skimmed milk where they separate, that is good feed for the growing of hogs, but not so good for fattening them off. Grain of mill feeds and corn are needed for fattening off the hogs and also for feeding the dairy cows to balance up the ratio and (293) supplement while they are on the pasture. High producing cows must
156 have grain to keep up the production, and this grain is not produced in Coos County; it must come from the outside. At the present time, I think, most of it comes from Portland. Some corn comes from Nebraska. I could not say where the other comes from.

The construction of a cross-State line would assist us in obtaining a greater or cheaper feed supply if it would reduce the rate, because the feed supply that we need is in southern Idaho, eastern Oregon, in Malheur County. Irrigation projects grow real good corn there, and, of course, the wheat land is over in that part of the world. Regardless of the question of rates, the proposed line would put us 400 miles closer to the most available feed supply for the types of feeds we need.

With reference to other agricultural products of my section of the State, there is a new industry being developed in the harvesting and selling of creeping bent grass seed. This seed is used for lawns and golf courses, and this year there will be in (294) the neighborhood of a thousand acres harvested, and it yields 200 pounds to the acre of seed. The seed sells for 90 cents to $1.50 a pound wholesale. There will be around 200,000 pounds of this seed available this year and sold, and, being an expensive seed, in the past it has been shipped mostly by express. The foremost of it has been used in California, but the eastern market is opening up for it. It has not been worked in the East; the market has not been opened up there. California has been using all the supply. So as soon as the California market is more supplied it will move to the eastern markets.

As to other products we produce, or could produce, that would move to the eastern markets—experiments have been conducted which have thoroughly proven that broccoli, lettuce, and green
157 peas can be profitably produced on the bottoms and bench land of Coos and Curry Counties, and these crops all must move to eastern markets and must have a direct route, and a quick route, in order to compete with other producing areas. We can produce these crops and get as large a yield, if not larger yields, than they can in the sections where they are grown at the present time, and also put them on the market when these other sections, such as Roseburg, are not producing. Because of the mild climate broccoli will (295) head in Coos and Curry Counties, with different varieties, from November, or even earlier than that, until up in April. All during that time we had broccoli last year heading. There are different strains of it that will head at those different times, and by developing these strains and producing them in larger quantities, why, there should be a market for them in the East, if we had a more direct route and one that would get them there quicker.

Then we have good conditions for the growing of vegetables and small fruits. We have good locations for canneries for canning peas. Berries grow naturally there. The evergreen blackberries grow wild all over the country, and there are tons and tons of it that could be harvested, and will be as soon as we get the canning facilities in there. And strawberries do exceptionally well, especially the Ettenburg or 121, which is the variety that is used for canning. Our climate and soil seem to be ideally fitted for the production of this berry. Then there are loganberries that produce heavier there than they do in the Willamette Valley. We have several fields that are producing in the neighborhood of four tons per year. And then there are huckleberries there to be canned,
158 and have been canned profitably. Small vegetables, such as carrots, beets, string beans, and several other vegetables similar to that, cabbage, do exceptionally well there and could be canned. And there are several canning concerns with their (296) eyes pointed in that direction that have been investigating. Whether they will locate there I can't say.

Then there is a poultry industry there that has been expanding. We have conditions somewhat similar to the famous Petaluma poultry conditions. We can produce green feed the entire year. Kale there is no danger of freezing, as there is in other sections. It is ideal poultry green feed. And eggs are at the present time being shipped direct to New York from our Pacific coast. If our poultry industry continues to develop, we will be shipping eggs out of there.

Then there is sheep industry and goats for the utilization of logged-off land that is on the rapid increase. Since 1925 we have 6,000 sheep in Coos County. There is around 10,000 in Curry County. And since that time the number of sheep has easily trebled.

There is around 18,00 0in Coos County alone. An dthis expansion is continuing.

There have been new methods developed of seeding logged-off land by the use of airplane in new grasses and clovers, and by the right pasture management of these lands they can be made into permanent pastures rather than growing back up into brush. On that large acreage of logged-off land, land to be logged off in Coos and Curry Counties, this should be one of the big industries of our section in a few more years. This land will support, when first seeded, around three sheep to the (297) acre, and later on it will not support quite as much but will always support one sheep to the acre.

159 That completes my discussion of the agricultural situation.

I said we had only 200,000 pounds of creeping bent grass seed. Some call it seaside bent. It is being contracted at 90 cents a pound this year. Before it has had some sale for as high as $2.00. Most of it has been shipped out by express before because of the value of it.

I am familiar with the estimates of available tonnage and potential tonnage from Coos and Curry Counties as set out in Exhibit No. 1, at page 20, as prepared by Mr. Teutsch. (298.) From my knowledge of Coos and Curry Counties and their agricultural production and possibilities I should say that those estimates as set forth on page 20 of Exhibit 1 are conservative. I have nothing further to add to my testimony.

Cross-examination:

Q. (By Mr. DEY.) Do I understand, Mr. Hale, that your pasture land down there, that all your available pasture land is stocked to capacity now, with the exception of that part that hay is raised upon?

A. All in condition for pasture. There is some that lacks drainage, that will be put in condition when it is drained. But practically all of the bottom land is utilized for pasture.

Q. In other words, there is no room for any more dairy farms down there?

A. Oh, yes; there is plenty of land yet to be cleared, slashed. (299.) There is 300 acres up Coos River cleared and ready for them to come in there and occupy. That has been diked and is now ready for use. And there is another farm right across the river, around 200 acres, that is ready for sale.

160 The average farm down there is around 60 acres. That would be an average dairy farm in the valley. Of course you get up the valley in small areas the farms are smaller. We have room for considerably more than eight or ten more dairy farms in there, that is, on the land that is now suitable for that purpose, that needs nothing more to be done to it. Our community has fared pretty well along that line. Our dairy industry has been good.

There has been no commercial production of broccoli for outside shipment. (300.)

Q. And the same is true of lettuce, is it?

A. Yes; lettuce has been shipped out, not by rail but by truck, to Willamette Valley and Portland vicinities.

All of these various small fruits and berries I have spoken of will be raised for purposes of canning in those counties. They will move out either by water or by rail in the form of manufactured products put up in cans.

Q. And those shipments that they move east will find available route, will they not, either over existing routes or over the so-called Alturas line which is being built, which will be reasonably satisfactory for that kind of product, would it not?

A. For the canned goods?

Q. Yes.

A. It would be more satisfactory than it would for the fresh vegetables and fruits. We have no intention of attempting to ship evergreen blackberries across the continent except in cans. They are very perishable, they don't ship very far. But broccoli and lettuce and green peas would carry. (301.)

We import very little alfalfa from California by water movement. Some comes into Bandon.

Q. Why don't you import more? You have got the water
161 route to move it up on and are so badly in need of it.

A. It is not available in California at the price that we can get it other places.

Q. Well, at which price have you got to have this alfalfa in order to make it profitable, in order to be able to use it profitably?

A. At the present price of butter fat we can pay $20.00 to $22.00 a ton.

Q. And you are paying now how much for that that moves down from the irrigation districts of eastern Oregon along the Union Pacific line?

A. $23.00 to $25.00. We import some at that price.

Q. But you have got to have it a couple of dollars cheaper before you can import more of it. Is that the idea?

A. It would be more profitable and more could utilize it.

I do not have the figures on the shipments in from Klamath Falls in the last two years, since the Natron cut-off has been in operation. (302.)

In mentioning some 15,000 head as being the total of the dairy cows in my district, I include Coos and Curry Counties in that estimate.

Q. Now you are speaking of the advantage that would accrue to the dairy areas over there if you could be relieved of raising hay and pasture at all. Now haven't you, at conferences with the farmers over there, been impressing upon them the importance and necessity of rotation, and that they will ruin their pasture if they pasture it too severely?

A. No, we have not in Coos County.

Q. Well, why do you say in Coos County?

A. Because the conditions are different there than they are in
162 other dairying sections—different than they are in the Willamette Valley. They are some different than Tillamook County.

Q. Well, haven't they impaired the grazing lands in Tillamook County a great deal by excessive pasturage, and aren't you doing it over there?

A. The pastures should be plowed up once in a while and reseeded. (303.) But if they are put into Lodino clover that is unnecessary; the longer it stays the better it gets. And so it is with canary grass. We have settings in canary grass that are 30 years old that have never been plowed, and it is better now than after it was seeded or at any time previous.

Paul V. Maris is director of extension at the Oregon Agricultural College, now known as Oregon State Agricultural College. He publishes a bulletin here for Coquille; it is a report of an agricultural economic conference at Coquille, Oregon, November, 1925. I know about that publication.

Q. Do you agree with this, reading from page 5: "There is an appreciable shortage of hay produced in the county for the dairymen. In 1924 this amounted to over 2,500 tons. In view of the recent development in vetch and alfalfa growing, this (304) shortage can doubtless be almost eliminated." Is that possible over there?

A. The policy has changed. That was in 1925. We have found that hay can be imported and land utilized for pasturage. Practice of the dairymen changed it. I did not come in there and change it; I am not capable.

Q. Now I notice at a convention down here, another publication of Mr. Maris, in December, 1925, in connection with the Columbia County economic conference. Did you attend that?

A. No, sir; I had nothing to do with that.

163 Q. He says, "It is not possible, under normal conditions, to feed twenty-dollar hay to cows and make a profit." You don't agree with that, do you?

A. It all depends on the cows. You see, they haven't been testing in Columbia County as long as we have. We have our cows up to a higher standard of production.

Q. Now do you think it is a good thing to move alfalfa hay several hundred miles when you have the hay production that you enjoy in western Oregon? (305.)

A. Where you can get better hay and at a reasonable price.

I am at the present time from Coos County. I was raised in the East. I have lived in Oregon, though, for ten years. I was in Clackamas and Douglas Counties. I was raised in Arkansas.

Q. Oh. Now has this condition changed? I read from the bulletin, another bulletin of Mr. Maris, of date February, 1926, report

of the Umatilla project, agricultural economic conference, Hermiston: "The demand for hay in western Oregon is steadily decreasing. A personal canvass of the leading dealers in the Willamette Valley shows that they are unanimous in declaring that they handle very little alfalfa now compared with the amount they sold five or six years ago. They say that where they used to handle it regularly they have a market for it now only in years of freeze-out or droughts." Is that condition as you understand it?

A. That is taking western Oregon as a whole, including the (306) Willamette Valley. Coast conditions are different.

Q. (By Mr. SPENCER.) Well, let's see. Now we will continue the next paragraph: "This situation is due to the enormous in-
164 crease of vetch, clover, and alfalfa hay in western Oregon. In 1925 the 19 western Oregon counties had 393,433 acres of hay, while in 1920 there were 327,841 acres. There has been no such corresponding increase in dairy cows and the increase is almost entirely in clover and in vetch which compete with alfalfa." The following figures indicate the decrease: Carloads into western Oregon in 1919, 302, and in 1924 and '25, the last year here, 2,100. I will not read the intervening years. Now do you agree with that?

A. As I said before, that includes western Oregon and the Willamette Valley, which is a large area compared with the coast section, and conditions in the coast section are entirely different. Hay production has not increased in those terms.

Q. There is no hay consumption on the coast section except over here in Coos Bay and about 30,000 acres down here in Tillamook County. Isn't that true? (307.)

A. Why, in Lincoln County there is some. There is a dairy country in Lincoln County along the Siuslaw River, in western Douglas County, western Lane County. They should need alfalfa in there too. They can get it right down here from the Rogue River Valley if the rates are right.

We have no prejudice in any of these coast counties against Umatilla County. We had just as soon have alfalfa from Umatilla County as from Malheur of the same quality.

I do not know whether Hermiston and Stanfield and Umatilla are the biggest hay-producing sections in the State, in alfalfa, or not. (308.) I know they produce alfalfa.

Q. Now I notice in this same Maris pamphlet here, from your Oregon State College, or Oregon Agricultural College, he
165 quotes the price per ton of alfalfa hay, that is in the stack, I assume at Hermiston, to the grower, in 1924, at $10.00, and in 1925 at $11.00. That says f. o. b. Hermiston on page 9. The rate from Hermiston to Marshfield is $6.50 a ton; the rate from Ontario and Vale on the cross-State line would be $6.80 a ton. Now why do you need the cross-State line for a little jag of hay to feed 15,000 cows?

A. We need the hay; it makes no difference where we get it. I don't think there is any excess hay produced in western Oregon

suitable for consumption by dairy cows. I don't think there is any shipped out. I could not say what the figures are for production.

I do not know how many dairy head there are in western Oregon. I can testify for Coos (309) County.

Redirect examination:

Q. (By Mr. Ellis.) Do I understand from your direct testimony there is a difference in the feeding value of the Willamette Valley hay, even the Willamette Valley or Rogue River Valley alfalfa, and that produced in the higher areas of central and eastern Oregon?

A. I do not know the comparison of Rogue River Valley and the Willamette Valley, but the comparison between Willamette Valley and eastern Oregon is about 20 per cent in favor of the eastern Oregon hay.

I am not familiar with the estimates of Mr. Teutsch for other than Coos or Curry Counties. (310.)

166 Recross-examination:

I do not wish to be understood as thinking that the estimate I referred to on page 20, that the Examiner inquired about, that that tonnage would go by the cross-State line.

Exam. ROGERS. I thought you agreed with Mr. Teutsch on his exhibit, in so far as it related to Coos and Curry Counties, and Mr. Teutsch, as I understood it, said this tonnage would move via the cross-State line?

A. That is the available tonnage that will be needed. That was my understanding of that, and as conditions are now there is no reason why it should not move by the east and west line. I think it would move by the east and west line.

Q. (By Mr. SPENCER.) Why do you think it would move by the east and west line instead of by the Southern Pacific, or via the Great Northern or via the Alturas route?

A. They are opening up all these new irrigation projects in (311) eastern and central Oregon. Those projects would be available and we would have a market.

Q. Have you made any study of the production of alfalfa in more accessible irrigation projects to determine whether that is probable at all?

A. Whether it is profitable to ship it from over there?

Q. Whether there will be any movement of alfalfa in here from the new one if there is not from the present one.

A. I don't see why it should not.

Q. Why don't they move it now?

A. As I said before, the Ochoco project was a failure principally because of a lack of a market for the alfalfa hay. I could not say that the Umatilla and Hermiston and Stanfield projects have been dragging for 20 years looking for markets; I am not familiar
167 with them. I could not say about Klamath Falls. (312.) I say I do line up hay for them, or put them in touch with

contractors. I don't buy it directly. I put them in touch with buyers in the Willamette Valley, and we have also told them of hay for sale in Klamath Falls district. I don't know whether they bought it or not; I could not say. There must be some hay down there at Klamath Falls. There is hay in Hermiston. There would be hay produced nearer Coos County than Ontario and Vale in eastern Oregon. There is now. (313.) We use some it and will use more.

Mr. DEARMOND. How about central Oregon, for instance the Crook County hay supply? If we get a cross-State line, it will be a lot nearer, will it not?

A. Yes, sir. I do not know whether there is an available supply there or not. I haven't been there. (314.)

SAMUEL L. NEWTON was therefor called as a witness on behalf of complainants, and having been duly sworn testified as follows:

Direct examination:

I hold the position of rate expert with the Public Utilities Commission of Idaho. I have been rate expert with that commission a little over five years. I was also about seven years with the Oregon Short Line, two and a half years in the auditor's office of the Mexican National Railway, in the city of Mexico.

Exhibit No. 5 was prepared by me. I think that this exhibit is really self-explanatory, and wish only to call your attention to some important points and (315) will explain some of the pur-
167 poses of some of the pages of this exhibit. The source of information is stated, I think, on the pages as we go along. The first page is from Form 1308 by the superintendent of car service of the Oregon Washington Railway. I should have said on file with the Public Utilities Commission of Idaho. It is the turnover by the Oregon Short Line Railroad to the Oregon-Washington Railroad & Navigation Company at Huntington. This is a westbound movement and shows an increasing demand for the various commodities listed by points west of Idaho, and we surmise largely coast points. The increase is noted at the bottom of the page, 1927 over 1921, of 10,666 cars.

Page 2. If you will, kindly correct the heading of column two. It reads now, "Originating on center line." It should read, "Originating on entire line." In carload traffic of the Oregon Short Line Railroad, I call your attention to the traffic originating in Idaho, and to the total movement. The Oregon Short Line Railroad did not include in their annual report traffic originating in Idaho until 1916. The amounts shown for 1914 were in response to special request. Amounts for 1913 and 1915 can not be ascertained, as records are destroyed by permission of the Interstate Commerce Commission. Note (316) that although figures for 1920 are higher, 1927 volume shows considerable increase over 1913 and 1914.

Page 3, San Francisco's imports. The exhibit does not state that these originated in the 10 southwestern counties of Idaho, but no

doubt most of the eggs, dressed poultry, and butter did. San Francisco purchased other commodities, but not in Idaho, and the exhibit shows that Idaho produced all of them except cucumbers. Cucumbers were produced but not shipped, but made into pickles at Nampa. The opening of more direct communication would,
169 we believe, enable Idaho to sell more of her products in San Francisco.

Mr. L. T. Wilcox, assistant freight traffic manager of the Union Pacific system, testified in a hearing before the Interstate Commerce Commission at Twin Falls, Idaho, docket No. 20,415, as recorded in the transcript of that hearing, at page 234: "A quicker service between the producing territory"—The transcript is not with me. I was present at Twin Falls.

Mr. SPENCER. I object to the reading of the transcript without having an opportunity to determine whether the (317) quotation reflects the real expression of the witness.

Comr. MCMANAMY. What was this transcript?

A. It was of a hearing at Twin Falls April 3rd, Public Utilities Commission of Idaho against Oregon Short Line Railroad Company and the Southern Pacific Railroad Company. I believe the quotations I read from it complete statements of fact. (318.) As far as I understand you to mean complete, it was a sentence that he uttered there at that time, and it is a complete statement of fact, if that is what you mean, I believe.

As recorded in the transcript of that hearing at page 234: "A quicker service between the producing territory and the consuming territory that sometimes has the effect of opening a new market, in fact it very frequently has the effect of opening a new market." (319.) That statement expresses my own views.

Page 4, carload shipments from 1921 to 1927, inclusive, from the 10 southwestern counties of Idaho. Adams County does not appear, as a shipment from Adams County was included, I believe, with
170 the shipments from Washington County, Adams County being served by the Pacific & Idaho Northern and freight originating on that road was turned over to the Oregon Short Line Railroad Company at Weiser.

Those are carload shipments. Note that while there is considerable variation, one year with another, the total for 1927 exceeds all other years except 1923.

Page 5, carload commodities shipped 1921 to 1927 from (320) the 10 southwestern counties of Idaho. On page 4 note the carload shipments from the counties, and page 5 shows the commodities that were shipped. I have not the destination; simply the production and shipment from those counties and the commodities that were shipped.

Pages 6 to 12 are the annual shipments of the carload commodities from each of the 10 southwestern counties of Idaho, which are summarized on page 4. It goes through each one of the years, 1927, 1926, back to 1921, at page 12.

Pages 13 and 14, total expended on highways of the different counties in Idaho, 10 southwestern counties, and the number of cars and trucks each year in those counties.

Pages 15 and 16, auto and truck registration in the 10 southwestern counties in Idaho, 1918 to 1927.

On page 17 I have stated that the increased registration does not fully show increase of automobiles. If, as United States Internal Revenue office figures, five years is the life of a car, then replacements in 1923 of cars in use in 1918 would be 8,194; in 1924, of the cars in use in 1919, 11,014; in 1925, of the cars in use in 1920, would be 14,495; in 1926, of the cars in use in 1921, would be 15,494; in 1927, of those in use in 1926, 16,581; a total replacement of 65,778. (321.)

171 The number of licenses in 1927 exceeds the number in 1918 by the difference between 26,439 and 8,194, or 18,245, or a total of new cars purchased of 84,023. I expect that the commission will be able to put on an automobile dealer who will be able to confirm these sales or state the correct number, if I have not come near it.

Page 17 states that the freight charges at an average of $150.00 per car would produce a revenue of $12,603,750 to the carriers.

Page 18, relationship of population, expenditure on highways and autos and trucks: Figures for 1920 and total for all years of amounts expended on roads. Notice that although the population increased 6,888, the autos and trucks increased 11,944, due, we believe, to improved roads. The per capita expended on roads seems to have had a direct influence on the automobiles and trucks for the number of persons. For instance, Adams and Valley Counties show no expenditures for 1920, and an auto or truck for each 11 and fraction persons but after expenditures as shown for 1927 there was an auto or trucks for each four and a fraction persons. The total for 1927 includes all the amounts for the years intervening between 1920 and 1927. It was not expended in that one year of 1927, but in the intervening years as well.

Page 19, gasoline sales for 1925, 1926, and 1927, as reported by the office of the Secretary of State. The data (322) shown on pages 13 and 19 may seem entirely irrelevant to the building of a railroad across central Oregon, but the pages of Exhibit No. 7 will explain the relation of these pages to a shorter line to San Francisco.

172 Mr. THOMPSON. I now ask to have Exhibit No. 5 for indentification admitted in evidence.

(The statement so offered, having been previously marked for indentification, was received in evidence as "Exhibit No. 5, Witness Newton.")

Mr. THOMPSON. I now ask to have this marked Exhibit No. 6 for identification.

(Said statement was thereupon marked "Exhibit No. 6, Witness Newton," for identification.)

I prepared Exhibit No. 6. In compiling the data relative to the carload shipments from the 10 southwestern counties of Idaho it was necessary to tabulate the shipments from each individual station on the (323) Oregon Short Line Railroad, Mountain Home and west. Unless some one would care to know the amount shipped from any particular station, I have no desire to call your attention to anything in this exhibit, as the shipments for the years and recapitulation have already been placed in the record by Exhibit No. 5.

Mr. THOMPSON. We ask that Exhibit No. 6 for identification be admitted.

(The statement so offered, having been previously marked for identification, was received in evidence as "Exhibit No. 6, Witness Newton.")

I have nothing in the record to show the destination of these cars.

Mr. THOMPSON. I ask to have this paper marked Exhibit No. 7 for identification.

173 (Said statement was thereupon marked "Exhibit No. 7, Witness Newton," for identification.)

Exhibit No. 7 was prepared by me. The exhibit shows that the towns mountain home and west bought on the north Pacific coast and around San Francisco (324) in 1927, as far as copies of reports by agents of receipts at the various stations were filed at the office of Joel L. Priest, general agent at Boise, show. Page 1 states that the record is not complete, and the reason being that some months were missing in the reports that I took from Mr. Priest's office. The month of August is entirely omitting of the shipments received at Boise, and I don't remember what others are missing but they were not all complete.

On page 2 I again call your attention of the increase of population, believing with more people, more would buy their needs of automobiles, gasoline, sugar, tea and other commodities which record shows were imported for their use.

On page 3 and other pages following you will notice routing. Where I have used the letters "O.-W. R. N.", it is to signify that the shipments moved via the Oregon-Washington Railroad & Navigation Company and all rail to the destination. Where the letters "SS" precede "O.-W. R. N." it shows that the shipment moved via steamer from California points and Oregon-Washington Railroad. The letters "RR" also are shown, indicating that the shipment moved all rail through Portland on to destination. The words "Ogden," "Salt Lake City," and "Wells" also appear in the routing, indicating that the shipment moved all rail through Ogden, or through Salt Lake City, or through Wells to destination shown.

174 You will find that fir lumber moved—I see (325) one here in Boise, Idaho, in the month of February, this second item; one Ogden, O.-W. R. N. It occurred to me that possibly by opening a railroad across central Oregon, that the fir timber which has been

spoken of as being west of the Cascades might possibly find a sale in Idaho and movement over this new road, which would be, we believe, an advantage to Idaho in having competitive points selling the same commodity.

You will notice also shipments by steamer from California points. Allowing three miles of water to one on land would place Portland 250 miles from San Francisco; adding 500 miles to Ontario would make 750 miles to San Francisco via Portland. The distance from Ontario via the new railroad I understand would be about 800 miles to San Francisco. Many shipments now sent by water might be sent all rail due to the shorter time of transportation, and surely the all-rail shipments now routed via Portland would go via the new and shorter route. As to the route via Ogden and Salt Lake City, the proposed road should get all of them and nearly all of those sent via Wells. Of the shipments to Boise from San Francisco points, around the bay there, as shown on pages 3 to 15, 68 were routed via Ogden, 10, via Salt Lake City, 5 via Wells, 134, via Portland and steamer, and 131 via Portland and all rail.

To Weiser, two went via Ogden, 43, Portland steamer, and 32, Portland all rail. (326.)

To Fayette, one, via Ogden, nine, Portland and steamer, 43, via Portland and all rail.

To Caldwell, 23, Portland and steamer, 56, Portland all rail.

To Murphy, 2, via Ogden.

175 To Emmett, 1, via Ogden, 14, Portland and steamer, and 5, Portland all rail.

To Parma, 2, via Ogden.

To Mountain Home, 1, via Wells, 2, Portland all rail.

To Nampa, 37, Portland and steamer, 48, Portland all rail.

There are a great many shipments of carloads of automobiles that went all rail. They were from Melrose, California; largely, to southwestern Idaho. I understand that the automobiles are manufactured in the East and shipped in a knocked-down condition to assembling plants, which have lately been established in California, and are put together there and shipped to the destinations as shown.

The advantage of the cross-State line (327) in shipping automobiles from Melrose, California, to southwestern Idaho, is that on account of the distance being shortened they would move quicker, I believe, in the transit of them. The purpose of the showing with respect to automobiles and the cross-State line is because automobiles are loaded in cars and move all rail, and on account of the shorter distance which would accrue over the proposed line, we believe that all of those automobiles would move via the shorter distance, the shorter route. Generally the dealer is anxious, I understand, to get the cars for sale so that they can have them as quickly as possible.

Exam. ROGERS. Well, does the number of automobiles in use now indicate the number of automobiles that will be shipped in in the future?

A. Why, the replacement on automobiles would indicate that there would be a good many, if, as stated on page 17 of Exhibit No. 5, the life of an automobile is considered as only five years, and I
176 know personally that many consider that they should turn in their car after they have used it one year on account of the depreciation and liability to need repairs, and purchase new cars. And it would indicate that there would be (328) replacement of the number that were in use five years previous. In 1927 I have estimated that on a five-year basis there would be a replacement of 16,541 cars in the 10 southwestern counties of Idaho. How true that is, not being an automobile dealer, I could not testify, but only on the supposition that the life of a car is five years and would need replacement in that time.

I selected the 10 counties listed on my early exhibits because they are situated in southwestern Idaho and would be those counties that would be particularly affected by the shortening of the distance over the proposed route. I included no counties that I did not believe would receive some special benefit from the (329) cross-State line.

(Said statement, having been previously marked for identification, was received in evidence as "Exhibit No. 7, Witness Newton.")

I have prepared an exhibit similar to the one which I have just explained, but showing the receipt of various commodities at stations on the Oregon Short Line within the State of Oregon.

This exhibit shows receipts from the north Pacific coast and from around San Francisco, by stations on the Oregon Short Line located in Oregon on the branch from Ontario to Brogan and Burns, and also one station on a branch line south of Huntington, Robinette station. The routing directions are the same where it moved
177 all rail by the Oregon-Washington, whether it moved by steamer from San Francisco or moved all rail or whether it came by the way of Ogden. And receipts from California points show that Nyssa received one car all rail (330) via Portland; Juntura, 1 car all rail via Portland; Burns, 10 cars all rail, via steamer, 4; via Ogden, 1; Robinette via steamer, 1; Vale via Portland, all rail, 10; Ontario, via Portland, all rail, 24; via steamer, 22; Crane, via Portland, all rail, 4.

I was just reading the summary. The exhibit shows on page 1, first, Nyssa, carloads received at Nyssa and farther down the page at Juntura, and then at Brogan. I see that Brogan got one car of black powder, all rail. On page 2, receipts at Burns, taking in also page 3. Page 4 is Robinette; page 5 is Vale; page 6 is Ontario, also continued on pages 7 and 8; page 9 has the receipts at Crane and at Harper.

Exam. ROGERS. Mr. Newton, these various exhibits leave the commission to exercise its judgment as to which of the shipments would be routed over this cross-State line, don't they? Have you got anything to help us on that?

A. I am taking the position, expressing the belief, that where it shows that the shipment moved all rail from California points, that such shipments and like shipments in the future would, on the completion of this cross-State Oregon railroad, move via the new line on account of the shorter distance. Where it shows all rail from California points they would (331) patronize the new line on account of the shorter distance. As to how it would move originating at San Francisco Bay, it would originate on the Southern Pacific. Moving all rail, as it does now to Portland, it would move via the Southern Pacific, and, we expect, would be turned over to
178 whatever road built across central Oregon, at Crescent Lake or the junction point. Instead of being routed the whole distance to Portland and then over the Oregon-Washington to destination, as it does now, it would take the shorter *t*oute on the completion of this road.

On traffic moving all rail from San Francisco to Ontario I think by the new line the distance would be about 800 miles, via the cross-State line. I believe the present distance is in the neighborhood of 1,200 miles. A saving of about 400 miles in the haul, from what I understand. (332.)

(Said statement so offered and received was marked "Exhibit No. 8, Witness Newton," and is forwarded herewith.)

Cross-examination:

Taking Exhibit 8 I don't contend that any of the traffic originating in western Washington, or in Portland, or in western Oregon north of Eugene, would reach Boise or any of these other southern Idaho cities via a cross-State line. I have only called your attention to the routing from San Francisco as probably moving over the new line.

As to Exhibit 7 a very considerable number of shipments from California moved via steamship to Portland and thence by rail to our southern Idaho city. There is a through rate, proportional rate there, water and rail. (333.) That arrangement very probably would continue, irrespective of how many railroads we had to San Francisco, although if there was any reason to have an expedited shipment it probably would move by the new line on account of the shorter time. That is all.

179 Our expedited shipments there, to expedite those shipments from southern Idaho, at the solicitation of the Government and all the officials up there and of the growers in those irrigation projects, after long petition and clamor and request, a line was built from Rogerson, the terminus of the Twin Falls branch, down to Wells, Nevada, connecting with the Southern Pacific, or Central Pacific. We feel that the line is not used to the extent that it should be, and therefore the Public Utilities Commission of Idaho, at the solicitation of people of Idaho, brought this case which I have

made reference to, 20415. We believe that the rates were too high over that line, is one reason it was not used as much as it should be. If the rates are properly adjusted, I believe that line would receive the patronage of southern Idaho counties that I have listed here. (334.) That is what we asked that hearing for. It might have more patronage over that shorter line.

The Western Pacific has been authorized by the Interstate Commerce Commission to expend a large sum of money to effect and accomplish a physical connection with the Wells-Rogerson line. I do not know whether work has started yet or not.

As to a good reason for southern Idaho to be asking for a line across the Oregon desert, when they have had this one constructed at their own petition and request, I think I explained one reason possibly, when I quoted Mr. Wilcox saying that quicker service between producing territory and consuming territory would have practically the (335) effect of giving Idaho a new market, and if the distance is shortened over that new line and it were closer to San Francisco, some of those products we raise and do not sell in San Francisco might possibly be sold there.

180 Exam. ROGERS. If this Western Pacific construction goes through how will the distance compare then?

A. Why, the connection the Western Pacific is making is at Wells. Now the connection there is only between the Oregon Short Line and the Southern Pacific. Both the Southern Pacific and the Western Pacific pass through Wells, and the Western Pacific is now making preparations to connect to the Oregon Short Line. The distance will be longer by the Western Pacific to San Francisco than it is by the Southern Pacific, but there are many points in Nevada and northern California, especially to California, that the Western Pacific reaches that the Southern Pacific does not. The Western Pacific makes no better connection than we have now at Wells via the Southern Pacific. We have a through route now via Wells (336) and the Southern Pacific to central and northern California.

Q. You don't suggest that southern Idaho products destined for Los Angeles should move via the Southern Pacific through central California, do you?

A. If the matter of distance was considered, and the Southern Pacific completed the broadening of the line from Tonopah Junction to Owenyo, the distance will be shorter to Los Angeles than it would by the way of Ogden from Twin Falls and counties west of there.

No one has made any complaint about the service of the Union Pacific. The Oregon Short Line is satisfactory from southern Idaho counties. It moves to Los Angeles via Salt Lake. (337.)

We hope we will have now, when the Western Pacific completes its connection at Wells, a competition on the Wells-Rogerson

181 line by the Southern Pacific and the Western Pacific for business in southern Idaho.

Q. And the Short Line turns it over to either one of them. Now, if there is any business to move there, don't you conceive that is the way it will move instead of taking the Oregon cross-State line?

A. Well, Mr. Spencer, it will right now, but after the completion of that cross-State line the distance is quite an item of consideration on perishable stuff, and there might be a whole lot of business that would find it better to go by the shorter route.

The Oregon Short Line is considered a very high-grade railroad, as far as construction and maintenance and equipment are concerned. I don't suppose the Burns line is comparable with the main line at all. I have never been over it. (388.)

As branch line construction, if such construction is made across Central Oregon we would expect, from our experience with the Union Pacific, that the Union Pacific, if they built the line, would make that part of the line just as good as any other portion of it.

As to whether the branch lines of the Oregon Short Line are as good as the main line, we would not consider that a branch line, making connection through to San Francisco that way.

Q. What is to become of the line from Wells to Rogerson, if you are going to build a line across there, to maintain it?

A. The Twin Falls people think they have a whole lot of tonnage they will originate under proper rates that will help out that Rogerson-Wells line.

Q. Well, they are limited in water supply. What is going
182 to happen over here, if you divert a good chunk of your traffic over a cross-State line, take all the northern and eastern traffic and put it down the Snake River Canyon, and the rest (339) of it down to Wells, Nevada, where is the O.-W. R. & N. going to have any place in the sun?

A. Why, Mr. Spencer, we are opening up new irrigation projects. We expect we will have enough to supply all of those roads. We hope so, anyway. We are very optimistic on that score.

The commission will have a witness, I think, who will explain as to what extent the irrigation projects are utilized now.

It seems to me this Rogerson-Wells cut-off was constructed in 1915, but I am not sure.

Q. To refresh your memory, isn't it a fact when we were hearing this case before in this court room four years ago that the Southern Pacific and Union Pacific constantly held before the commission the panacea that would be created by the construction of the Rogerson cut-off?

A. I remember now they were working on it, but it was not completed at that time. (340.) At the present time that cut-off has a train three times a week each way. There is passenger service over that cut-off only in connection, I believe, with a mixed train.

I could not say as to what effort has been made by the Oregon Short Line to develop and utilize the Rogerson-Wells cut-off to its fullest capacity. The rates were made from many points in

Idaho the same via Rogerson-Wells cut-off as they were by the way of Ogden. In the former case the Rogerson-Wells cut-off
183 and the service it would perform to southern Idaho was mentioned, I believe, several times constantly as the solution of all the problems for southwestern Idaho.

Redirect examination:

The Oregon Short Line division claims the Rogerson-Wells cut-off (341) as a branch line.

Q. Was the Rogerson-Wells cut-off constructed at the request of Idaho to serve all of southwestern Idaho, these 10 counties that you have discussed here, or was it designed mainly to serve, and does it mainly serve, the Twin Falls section, which you have not included in your exhibit, and points east of Twin Falls?

A. Well, I can't speak for the Oregon Short Line officials, but the people at Twin Falls and that vicinity have labored under the idea that that was built for their special accommodation. I know that.

I have not alluded to the Twin Falls district, or the district east of Twin Falls, in my exhibits.

I don't think I was present when Mr. Armstrong, chief engineer of the Oregon Short Line Railway, was on the stand, testifying in re that cut-off. I don't remember. (342.)

I have the comparison of distances from these 10 southwestern counties to San Francisco over the cross-State line as against the distance over the Rogerson-Wells cut-off calculated. I have them tabulated here. Payette, which is only a short distance from Ontario, would be 154 miles nearer San Francisco over this proposed line than it is now by the way of Wells.

Mountain Home is the most eastern point I have shown any shipments from, or any shipments to, and Mountain Home
184 would be nearer to San Francisco by the present route via Wells than it would by the proposed route. (343.) It would be 41 miles nearer San Francisco by the way of Wells than it is by the proposed route. The advantage as you go west from Mountain Home would accrue to the cross-State line, as compared to the Wells route.

PORTLAND, OREGON, *August 4, 1928.*

ANDY P. DAVIS was thereupon produced as a witness on behalf of complainants, and having been first duly sworn testified as follows:

Direct examination:

I reside in Marshfield. I am secretary of the chamber of commerce at present. I have held that position almost a year. I have resided in Marshfield and vicinity almost 19 years, with the exception of three years I was in Seattle during the war. Prior to becoming connected with the chamber of commerce I was the district supervisor for the Pacific Lumber Inspection Bureau, having charge of all of the inspection of lumber (345) on Coos Bay in that district. I

have compiled for the purpose of this record statistics showing shipments of lumber from Coos Bay over a period of years.

In 1922 there were shipped from Coos Bay 806 carloads; in 1923, 2,011 carloads; in 1924, 1,904 carloads; in 1925, 2,800 carloads; in 1926, 2,546 carloads. I didn't get 1927. I didn't have time to dig them out. I am familiar with the 1927 production in my community. 1927 will be, I think, perhaps a little less in rail shipments than in 1926, for this reason, that one mill down there that shipped (346) 427 carloads in 1926 is now closed, burned. The rail
185 shipments will not be more in 1927, in my opinion, than they were in 1926, because of this mill having burned. In my judgment it will not be materially different.

As to the present trend, during 1928, that mill is not running, but the other mills, I think, are shipping more than they did formerly by rail. I think 1926 is a safe guide or estimate for both 1927 and 1928. Other than the mill that burned, the several mills that are operating are doing a little larger business than they were during 1926. And the veneer plants are shipping, I believe, more than they did in '26 and '27. They seem to be running more overtime than they did in those years, and for that reason I believe that they are shipping more material.

My figures indicate a rather healthy growth in the lumber shipments over this period of years.

In the summary I have given are included (347) Port Oxford cedar, fir, hemlock, and white fir. There have been several carloads of myrtle wood shipped, of which I didn't take a record. I should judge in the past year there has been 30 carloads of that shipped to the eastern furniture manufacturers. All of this lumber was manufactured on Coos Bay. There was some that was shipped to the interior of California, but I don't know how much, what proportion. Most of it was shipped to the east in the form of dry lumber. The cedar that was manufactured by the veneer plants goes to Chicago and eastward almost exclusively. The fir goes to the Middle West, Mississippi River points.

In addition to the carload rail shipments (348) I have described there is a substantial quantity shipped by boat out of Coos Bay.

I have nothing to add to the figures that are already in
186 this record that were placed in the exhibit of Major Maginnis.

I can add nothing to what Major Maginnis has said with reference to cargo shipments of lumber. I believe that he stated that when that shoal that he mentioned that is inside the bar was removed that it would be an incentive to the shipment of more lumber by boat.

At the present time the common grades of green lumber mostly go by water because of their weight, and the upper grades of kiln-dried lumber, such as stock, the battery-separator stock, and the higher priced lumber, goes by rail. (349.) All lumber moving to markets of the Middle West would move by rail. I wouldn't say

the Atlantic Coast, because they have a line of boats running to the Atlantic Coast that might take that, but the Middle West would take all of that by rail, or a great proportion of it.

With reference to the development of specialty wood manufacturing industries on Coos Bay and their requirements as to transportation, almost always the specialty products go by rail—for instance, battery-separator stock—but the largest veneer plant down there has told me that from five to six per cent of their output goes by water. They ship an average of 200 cars a year. That is a very high-valued commodity. (350.) Six or seven per cent goes by water, and the rest by rail. The value would be from five to twelve thousand dollars a car. I wouldn't say that it is necessary that that class of commodity have express service, but naturally when a man loads a carload worth $8,000 he wants to get it to its
187 destination and get the returns back. It is not necessarily perishable, but on account of the value and the distance it is important. I believe that line of industry is increasing on Coos Bay at the present time. At the present time we have four factories or mills in Coos County manufacturing high-grade lumber articles. I do not think there are any others outside of Coos County; none in Curry that I know of.

From the standpoint of Coos Bay as a whole of the necessity for better transportation (351) facilities and a more direct route to the East, there is a possibility that the freight rates would be reduced if there is a shorter line. It seems to me so.

I think the opening of the route to middle west and eastern markets shorter by 400 miles would be a benefit to Coos Bay.

I do not know the route now followed by our lumber shipments to eastern markets. I do not know whether they go by way of Roseville, California, or through the Portland gateway. They would have to go from Marshfield or North Bend to Eugene, in the first place. And then to get to eastern markets, under present railroad construction, they would either have to move north to Portland (352) and thence east over some of the lines from Portland, or else south from Eugene into California, to Roseville, and thence east. In comparison with the two existing routes, one through Portland and one through Roseville, the cross-State line projected would make a much shorter route to eastern markets.

188 Cross-examination:

I have had no experience in sawmill operations, except in so far as my business as lumber inspector has brought me very closely in touch with the manufacturer, that is all. I have been supervising the inspection of lumber for the last 10 years, on Coos Bay. (353.) That does not necessarily bring me in contact with the lumber trade in this territory. I would not say I was informed fairly well with respect to lumber operations in competitive cities and towns in this

territory. My experience has been in Washington and Coos Bay. I know the size of the mills around Coos Bay and some in Washington, about Seattle.

Q. I notice by the figures you gave that the range in number of cars shipped by rail from 1922 to 1926, inclusive, range from a little over 600 cars to 2,800 cars. Now, do you know the car loading in feet? (354.)

A. From 20 to 25 thousand on each car.

Q. At a medium of that amount, taking the average of 23 thousand or 24 thousand feet to the car, your rail production will not aggregate over 50 to 60 million feet a year. Now, it isn't very much of a sawmill that doesn't put out a larger volume than that, is it?

A. A good average sawmill will cut from 60 to 100 million feet a year. I think our mills over there cut, in the aggregate, from the figures that were introduced in Exhibit 4, when totaled with our rail shipments, in excess of 300 million feet a year. We are shipping by water from 80 to 90 per cent of the lumber that is cut over in that country. (355.) We have a railroad in there now to serve that country. Lumber is our principal output and commodity.

189 I haven't any idea how much is invested in that railroad. I believe they say it is 122 miles from Eugene to Marshfield. There are a number of bridges over the rivers and bays and estuaries that are necessarily crossed in reaching our city. We want additional rail service in a competitive way for our community. I don't know how that is to be accomplished. Our chamber of commerce has not considered in particular that feature of it since I have been there. I know that the proposed line involved here terminates (356) on the eastern slope of the Cascade Mountains, some 225 or 230 miles from Marshfield. It is 240 miles to Portland. If that line terminates on the unsettled slope of a mountain 225 miles away, it will not benefit us.

Q. The mere connection of its tracks with the Southern Pacific in the fastnesses of the Cascade Mountains wouldn't help Coos Bay, would it?

A. Does it connect with the tracks of the Southern Pacific in the Cascade Mountains?

Q. That is proposed.

A. It would give a more direct route from Eugene east, would it not? It would be more direct than going by Roseville?

Q. But how about Portland?

A. Wouldn't it be more direct than coming by Portland? I don't know. I haven't considered that. (357.) It looks to me it would be a more direct route. I do not know whether both of them converge and come together at Granger, Wyoming.

There are only two ways for lumber to be routed out of Eugene now, and that is north by Portland or south by Roseville. It now takes both, I fancy. I am not familiar with the shipment, with the routing of the lumber.

This battery stock is pretty much of a finished product.
190 It is selected material and expensive of manufacture. It is worth probably 80 to 100 times as much per car as the ordinary lumber shipped out. (358.) There is some goes by express, but no much. The total shipments aggregate, I should think, a couple of hundred cars a year. I do not know what rate it takes. I am not a railroad man.

One plant manufactures veneer products, and they have an addition now that they are manufacturing furniture. Two of the battery plants, I believe, do not manufacture anything but these battery pieces. The 200 cars I mentioned is the output from one mill. In 1926 the Pacific Veneer shipped 55 cars. (359.) And the Coos Veneer & Box shipped 217 in 1926. Western Lumber Manufacturing Company—those are the three large veneer plants down there—shipped 200 cars in 1926. That is 472 cars of veneer products went out of Coos Bay in '26.

Q. That includes your battery stock and your veneer stock—and what are these shades you manufacture over there?

A. That is another firm. I didn't get the shipments from that mill. I went to the office three or four times, and I didn't find the man in. They started about two years ago, but they have only recently gone into the manufacturing of blind stock, window-blind stock. I do not know the routing taken by these cars that were shipped.

Of these 2,000-odd cars a year of lumber (360), I would say 80 per cent goes east. That is an estimate, you understand. I have no data on that.

I expressed the view that we might get lower rates on lumber if this more direct route were accomplished.
191 I do not know the way the lumber rates are fixed from all coast territory west of the Cascades. If it is all blanketed to Missouri River and eastern markets on the same rate, another or a somewhat shorter route wouldn't benefit us at all.

Redirect examination:

In my answer that if the cross-State line terminated on the east side of the mountain it wouldn't benefit us any, I did not have in mind a connection with existing lines. If it does connect with existing lines, it seems that it would provide (361) us with through transportation to the east over a shorter route and benefit us.

In the delivery of such heavy commodities and slow-moving freight as lumber, the fact that it is moving over a shorter line and is delivered to the purchases at an earlier date as a result of that movement is a direct benefit to the producer. He gets his capital from the investment sooner as a result of that movement.

Recross-examination:

As to whether you made it plain that you were inquiring about a physical connection with the Southern Pacific track, you said if

it terminated on the eastern slope of the (362) Cascade Mountains. I don't think you made it plain to me.

The increased shipments by boat will not lessen the rail shipments. I think the buyer specifies the routing which those shipments will take by rail. (363.) I am not clear on that, however. Twenty-four hours' difference in time on the ordinary shipment of lumber between Oregon and destination would not make very much difference to the shipper or the buyer.

192 Exam. ROGERS. You gave as one of your reasons for desiring this construction that the shorter route might make possible a rate reduction. If no such reduction followed, to what extent would that lessen your favor of the proposed extension?

A. Except quicker delivery. That would be the only advantage then, I fancy.

The only advantage competition would be, would be a possible better supply of cars. We do not have car shortage at present. There was a car shortage in 1922 or '23, but I have heard no complaint of car shortage for two or three years. (364.) Competition might reduce the rate. I don't know of any other result of the added rail facilities than better car supply and competition.

R. S. MADDEN was thereupon produced as a witness on behalf of complainants, and, having been first duly sworn, testified as follows:

Direct examination:

I reside at Caldwell, Idaho. I grew up in southern Idaho. I am in the real-estate business principally—loans. A large part of my time is taken up with farm management, for non-residents, and also for a string of banks. The farms that I manage for the string of banks are located in the counties of Adams, Ada, Canyon, Gem, Owyhee, in Idaho, and Malheur in Oregon. I think I have one property looking after in Payette, Idaho, Payette County. This will be my third season at managing these farms. (366.) I have also been engaged in abstract business, and a few others. I have rep-

193 resented loan companies. I have represented the Union Central Life Insurance Company, and I used to represent William MacMasters, of Portland, when he was in the loan business. In representing these companies my duties were to take applications for loans and inspect loans—nearly all farm loans; some city loans. The farms I inspected were located in southwestern Idaho. Most of my loans were made in Ada, Canyon, Gem, Payette, and Owyhee Counties. From the time I was 15 until I was 20 years of age I was riding the range, in the southwestern part of Idaho. It has been (367) pretty close to 40 years since I was 16 years old. I was acquainted with the Boise Valley in 1890. I was acquainted with the agricultural operations in the Boise Valley in 1890. I was acquainted with the extent of the cultivation of the lands in Boise Valley in 1890 and the conditions of agricultural development in Boise Valley in 1890. In those days about the only farming that was done

was growing enough hay to winter the range stock, and enough grain to winter the range stock. That was true of practically all of southern Idaho—cattle and horses, and a few sheep—in those days. (368.)

I imagine about 25 thousand acres were rather indifferently irrigated in Boise Valley in 1890. None of the bench lands were irrigated at that time.

I was acquainted with the operation of agriculture in Payette Valley in 1890; with the extent of operation of agriculture. I should say from 15 to 20 thousand acres were in cultivation in Payette Valley in 1890, rather indifferently cultivated. There was no intensive cutlivation in either Payette or Boise Valleys in 1890.

194 I was acquainted with the Weiser Valley about 1895. (369.) There were probably 12 or 15 thousand acres in cultivation in the Weiser Valley in 1895. There was practically no development, agricultural development, along the Snake River in southwestern Idaho in 1890. There was a little agricultural development in 1890 along Reynolds, Sinker, and Sucker Creeks, along all those creeks—I imagine 5,000 acres. That would be my guess. That would be a mere guess as to what was in cultivation at that time.

From the time I was 20 until I was 27 I farmed, taught school. I taught school in Canyon County; was treasurer of the county. Canyon County at that time included what is now Canyon and Payette and most of Gem. (370.) I was once employed by the United States Reclamation Service. I assisted in the classification of lands on the Vale project, also on the Owyhee project; and then I have been used as a witness for valuation of real estate by the Reclamation Service in condemnation proceedings. I have never been employed by any bureau of the Department of Agriculture. I have worked in connection with the Bureau of Farm Economics, I think it was, employed in estimating the values—at least the tendencies of farm values. I have worked with some of the employees of the Interstate Commerce Commission who were estimating values on Oregon Short Line right of way.

While I was in the abstract business, for some of the irrigation projects we made up their assessment rolls and assisted in the valuation of benefits. (371.)

Q. In 1890 the lands irrigated in southwestern Idaho were by private corporations, were they not?

A. The farmers' ditches; yes—either individual ownership of ditches or private corporations.

195 As to what kinds of organizations are used at the present time for the operation of the irrigation works of southwestern Idaho, most of them are irrigation districts, which are public corporations.

I have prepared an exhibit giving the agricultural data of the 10 southwestern counties of Idaho. This Exhibit 9 was prepared under my direction. Page one of the exhibit simply shows the irrigation development by watersheds since 1902 in the 10 southwestern counties of Idaho. (372.) In 1902 there were approximately 183,000 acres of irrigated land; in 1920, 663,000 acres of irrigated land. That is the amount of land included in the enterprises in 1920. The lands included in the enterprises have been practically reclaimed at this time. That information came from the United States 1920 census report.

Page two shows the dry lands, the non-irrigated lands, that are farmed in the 10 southwestern counties of Idaho. This information was taken from the report of the State board of equalization of the State of Idaho.

Page three simply shows the expansion in irrigation development in these southwestern counties since 1899. In 1899 in these counties there were $2,800,000.00 invested in irrigation works; in 1920 there were a little over $25,000,000.00 invested in irrigation works, and since that time there have been about two and a half million dollars of an added investment from those irrigation works. (373.) That additional investment was in the construction of the Black Canyon Dam in the Payette River above Emmett, and also construction of the works for what we know as the first unit of the Black Canyon irrigation district.

196 I have no amounts for Adams, Gem, Payette, and Valley Counties for 1899. Adams was a part of Washington at that time, Gem and Payette were parts of Canyon at that time, and Valley was part of Boise at that time. All those counties have been organized since 1910.

Page four shows the increased cost of reclamation, the increased cost of reclaiming lands by irrigation. The average cost per acre now runs between $30 and $40, I imagine, when in 1899 it would run probably four dollars, or something like that, per acre.

As to why I prepared that: The better lands in our country, and I think in almost any irrigated country, are the uplands, the higher lands. The lands in the bottom, along the river, it cost very little (374) to irrigate; all we have to do is to throw in a dam and turn on the water; but the better lands are the higher lands, and a larger percentage of higher lands, after the ditches are constructed, than they are in the lower lands, because the returns are higher.

As to the length of time it takes to put all the lands under a ditch and have irrigated: Our newest completed project in that vicinity is what we call the first unit of Black Canyon, 7,000 acres. I think in 1920, or possibly in 1921, the ditches were completed and water was turned on. Within two years there was only 80 acres of land in that unit that wasn't in cultivation, and that 80 acres was owned by a non-resident.

The first unit of Black Canyon is in the Black Canyon irrigation district.

When a ditch is operated by an irrigation district, they ordinarily levy a flat assessment, so much per acre, which is a lien on the land, and is collected whether any water is used or not; that is, it
197 costs a man just as much for water whether he fails to farm his land as it does if he (375) farms the land.

Page five shows the growth in the value of farm property since 1900. This was taken from the Federal census. In 1900 in these 10 southwestern counties there was about $16,000,000 worth of farm property. In 1925 there was $102,000,000 worth of farm property.

Page six shows the number of farms in these counties from 1900 to 1925. In 1900 there were 3,270 farms; in 1925, 9,931 farms.

Page seven shows the value of the livestock on the farms during the same period in the same territory, from $5,800,000 to $12,800,000. From 1920 to 1925 there is a drop. Drop in the price of cattle and sheep, I imagine, would account for that. (376.) There may have been a decrease in the number. I know this, that in 1920 cattle on the range were worth about $75 a head, and when the slump came the finance corporations that held mortgages on the cattle shipped almost everything out of the range country over there, and they are just getting stocked up again. There was, I think, in cattle an actual decrease. I don't take this to mean cattle on the ranges, just the cattle on the farms. These figures were from the Government census estimates.

Page eight shows the crop values from 1910 to 1920 in the same counties. In 1924, southern Idaho experienced a drought, that is, short water. 1905 was a short-water year (377), and 1924 was a short-water year, and the crop in 1924 would not have reflected an average, because it was a particularly short-water year, a short-crop year. The 1925 census referred to the crops in the year 1924.

Page nine shows the acreage and production of six of our
198 principal crops for 1910, 1920, and 1927. The 1927 is estimated by the United States Bureau of Crop Estimates. The 1910 and 1920 were taken from the Agricultural Yearbook. That is for the State. It was not available for the 10 counties, was not segregated.

Page 10 simply shows the increase in population of these same counties from 1900 to 1925.

Page 11 shows production there on some of our crops in these counties for 1910 and 1920. (378.)

Page 12 shows the new irrigation projects in process of construction in this part of Idaho. The land in the Black Canyon district lies very near where I live, and I have been over practically every section of the land. I was one of the classifiers for the Reclamation Service on the Owyhee project, also on the Vale, Oregon, project. When these projects in Idaho are completed, there will be 75,858

acres of new land in cultivation. That is the figure given by the Reclamation Service.

Page 13, is an estimate of the carload shipments that would be added on account of these new projects. I mean by saying within five years, 424 carloads, going on the assumption that in five years' time half of the land will be in cultivation. (379.) The Short Line reports for 1927 indicate that Canyon County shipped about 1 car of products for every 30 acres of land under cultivation, Payette County shipped 1 car for every 9 acres in cultivation, and Gem County shipped 1 car for every 20 acres in cultivation. I may have made a mistake in my figures, as to the 424 carloads, but that is the way I ran the thing through. Canyon County, or the Gem district, lies in these three counties, and the land compares very favorably with the land already in cultivation, and that would
199 give about—with 51 thousand acres under cultivation in the Black Canyon project that would give about 1,283 cars of produce to move, and I just simply assumed that one-third of that should be available for the cross-State road. Then within five years, if 51 per cent of land in the Black Canyon is in cultivation, there would, as I figure, be 1,283 carloads produced more than at the present time to ship out of that district.

It will take longer time to bring the remaining (380) irrigable area under cultivation. I estimate that 424 additional carloads would be provided by the years after five years within the Black Canyon for shipment, for the new road—1,283 altogether. I do not know whether the 424 will go over the new road or not. I just took that as the figure and took the third of the amount and estimated it would go over the new road, if it is constructed. What I have under Owyhee was arrived at in the same manner. It would be about 24,500 acres, approximately, of new land in Idaho that would come under the Owyhee project. That would make 816 carloads available for shipment altogether within five years; another 815 after five years. (381.)

Page 14: The first section simply shows the other possible projects in these counties, and the second shows the possible car shipments, or the estimated car shipments, over these projects when they come in; then the last section on that page summarizes the irrigable area of these counties. These feasible projects have not been started. They have been pronounced feasible. I considered them in this set-up.

I have prepared an exhibit showing the irrigation development in the State of Idaho.

(Said statement, marked for identification "Intervener's Exhibit No. 9, Witness Madden," was thereupon received in evidence.) (382.)

200 Exhibit No. 10 was prepared under my direction. It simply shows the expansion of irrigation in Idaho since 1890. The capital invested in irrigation works in 1890 in Idaho was

$1,029,000. In 1920, 91 million was invested. (383.) That is shown on the exhibit. This information was obtained from the United States census reports.

(The statement, marked for identification "Intervener's Exhibit No. 10, Witness Madden," was thereupon received in evidence.)

I have had prepared under my direction an exhibit of assessed valuation of the territory embraced in the 10 southwestern counties. (384.) The exhibit explains itself.

(The statement, marked for identification "Intervener's Exhibit No. 11, Witness Madden," was thereupon received in evidence.) (385.)

I have had prepared under my direction an exhibit of the growth of bank deposits in Idaho.

(The statement, marked for identification "Intervener's Exhibit No. 12, Witness Madden," was thereupon received in evidence.)

The irrigation projects in the Black Canyon and Owyhee districts are in a large measure the (386) same as those described as the Vale and Owyhee projects in Mr. Teutsch's exhibit. I didn't see Mr. Teutsch's exhibit, but then I have been over all three of those projects very carefully, and they run just about the same. The Vale and the Owyhee and Black Canyon projects are about the same quality of soil as the Boise project, which has been in cultivation for 15 or 20 years. The same general commodities are
201 produced; the same climatic conditions. In a general way they are dependent upon the same markets. The principal markets, at the present time, depends upon the commodity. Perhaps I had better make this explanation, that part of Idaho is subject to a great diversification of farming. It isn't a one-crop country. They can grow almost anything, that is, that is grown in a temperate climate, and we can grow the things that there is (387) demand for, whether the demand be east or west, and what we grow will depend largely upon what the market is calling for. The markets now for poultry products and dairy products are California markets to quite a little extent; the market for hogs and cattle, Portland and Seattle. Our wheat moves to Portland. Clover seed and alfalfa seed moves east. Most of the fruit moves east. Most of the potatoes move east, although some of them move to California. When I say California markets, I mean principally Los Angeles and San Francisco. (388.) Our turkeys last year moved to Philadelphia, but most of the poultry products move, I think, to California. I am not positive of that. Most of our dairy products go to California. Our section of Idaho looks toward the Pacific coast for its market of a good many of the products.

I was a witness at the previous case involving this proposed construction. At that time I testified that the development of our section of the State had been held back and delayed by reason of lack of sufficient markets. I have not changed my mind on that question at the present time. I remember that in the previous hear-

ing the carriers advanced the Rogerson-Wells cut-off as an answer to our problem. I had the impression that that cut-off had just been completed. I don't remember, though. (389.) I ques-
202 tion very much whether any shipments go over that cut-off from our locality. I think most of them are routed by Ogden. They are routed by the carrier. They wouldn't be routed by the shipper. There has been no difference in the rates via the Rogerson-Wells line and via Ogden that I know of. I haven't been shipping, myself. I have the impression that they only have two or three trains a week over the Rogerson-Wells cut-off, and we don't have the same service that we have over the main line. In my judgment, the completion of the cross-State (390) line as proposed in this case would be of material assistance to the southwestern Idaho counties I have listed. I think my estimates of tonnage are conservative. The principal commodities I list are grain, sheep, hogs, poultry, butter, eggs, and potatoes. I have allocated only one-third of those commodities to the cross-State line. I wouldn't say that most of those commodities find their principal market westbound. I haven't analyzed that. Our grain at the present time moves pretty largely to the Pacific coast. Sheep move the other way, most of it. Some of our lambs move westbound, but most of our lambs go on the Chicago market. (391.) A more direct route, and one that would throw open both the Puget Sound, the Portland and the California markets, without additional haul, would unquestionably increase the westbound movement. The same would apply to hogs. Our poultry, butter, and eggs largely move west at the present time. Part of the potatoes move west and part east. As to whether any marked change has been made in the transportation facilities serving southwestern Idaho during the past 40 years, we have the same outlet now that we had 40 years ago, the same outlet both east and west. Branch lines have been built within the State, and we
203 have the same outlet that they had 40 years ago west. There has been all this development in the last 40 years, and we still have the same outlet west that we had 40 years (392) ago and no additional outlet west.

Referring to pages 13 and 14 of exhibit 9, I have made no estimate in my exhibits for diversion of the present production. As to whether that would probably be a substantial quantity in addition to what I have shown, it depends altogether upon the demand. We could double our production with the same acreage if we had the demand for it. For instance, if there was strong enough demand for hogs in the West, we would turn all our grain in hogs. We would ship the more concentrated (393) commodities. That would decrease the tonnage.

In this set-up all I have indicated there was the increased production. I haven't indicated as a part of our present tonnage that would be diverted over that road. I overlooked that. I have included only new projects. I haven't made any estimate for the possibility that

existing projects that have been farmed for a number of years under one plan might produce and ship a far greater quantity or a different type of product and ship it over the cross-State line upon its completion.

As to page 7 of Exhibit 9, referring to livestock (394) in 1925 and the marked reduction under 1920, I could not make an estimate of the value of livestock on the farms at the present time compared with 1925. There has been a substantial increase. 1925 was the bottom of the curve, so far as livestock was concerned. We were right in the trough of the depression in 1925. I think that now the livestock on the farms would be greater than in 1920. The live-
stock on the ranges would be not as high as 1920. Take the
204 Owyhee country, the Jordan Valley country, and it is under-
stocked now in both sheep and cattle.

The livestock industry at the present time is expanding very rapidly. (395.)

Cross-examination:

In re the livestock industry, particularly with respect to cattle and sheep, we have the range lands, which comprise private range lands, State range lands, and Government range lands. They usually turn out in March or April, and come in in November and December. Some stock are run on the ranges the year around, in most of our country over there. I know up on the Owyhee Desert, at an altitude of 4,500 or 5,000 feet, both the cattle and horses, that is, of the dry cattle, will run up there all winter. We can't do that in the ranges of the Blue Mountains. (396.) They range in the mountains in the summer.

The greater the capacity of the ranger the greater volume of sheep and cattle we can put on.

Q. Your range practically limits what you can grow?

A. We have two classes of stockmen over in that country. Andy Little turned out 106,000 ewes last year (397)—everything is on the range there—perhaps one of the biggest sheepmen in the country that I know of. Then there is the farmer who will carry from a hundred to two or three hundred head of ewes on the farm the year around. Now, the capacity of the range would limit the number of sheep that the purely sheep or the purely cattleman can run. That is the large operator, and the small operator runs his stock at large.

205 Q. But this, as far as shipping to the market is concerned, east or west, is a very small percentage of the entire movement, isn't it?

A. Oh, I think the wool all comes to Portland.

Q. The volume of beeves or mutton or lambs shipped is moved and shipped largely by these men who are operating the range in connection with their own home ranch. Isn't that true? The small grower doesn't cut very much figure in the volume, speaking from a percentage standpoint?

A. That would be true of sheep. I question whether it would be true of cattle. As to whether it would be true of cattle in the Harney country (398), I don't get over quite as far as the Harney country. The John Day country and the Wallowa country are out of my territory.

There is a relation between the home and the range ranch in a purely stock country, but we are more of an agricultural country than a stock country. In a purely stock country the Government allots to a certain rancher so many acres, according to his herd and flock. That is on the Government reserves. Those ranches are not operating to their limit now. During the past two months I have made a number of trips into the Owyhee country up there, and the complaint among the ranch owners is that there isn't stock enough to take up the ranges. That is the complaint among the ranchers there who have hay to sell. (399.)

Southern Idaho has been kept back. It hasn't gone as far or as fast as it could if it had had more attractive markets and more of them. I think this question of markets is the great question confronting the agriculturalist of to-day. I think southern Idaho has kept pace with other countries.

206 Twenty years ago there wasn't very much of a market on the west coast. Twenty years ago Seattle and Portland and San Francisco and Los Angeles were comparatively small towns. And they weren't calling for our produce, but they are now.

Q. Your production has increased as the demand has come to you? (400.)

A. I think in those days our market was mostly east. We are turning to the California market more and more all the time. Most of the shipments are going into Los Angeles, because we haven't a very good way of getting into San Francisco, as I take it.

Q. Do you think that the existence of these great producing valleys of central California has anything to do with the fact that the bay cities don't call on southern Idaho for your products and your crop?

A. I think that Mr. Newton's report would indicate that San Francisco reaches out to other States than Oregon and California, reaches east for a good deal of the things that we could ship in there if we had a little bit better connection. Los Angeles does the same thing. But we can't shorten the route very much to Los Angeles, but we can to San Francisco, from this country. (401.)

Turing to page 13 of Exhibit 9, that Black Canyon project lies between the Payette and the Boise Valleys, between the town of Caldwell in Canyon County and the town of New Plymouth in Payette County.

Q. Perhaps we can get at this if we had an irrigation map of southern Idaho. This is a map prepared by the Oregon Short Line Railroad purporting to reflect the irrigated lands in south-

207 western Idaho, as explained by the legend there. Do you recog-

nize that portrayal of the situation there as fairly reflecting the existing conditions?

A. Yes. (402.)

(Said map was thereupon received in evidence, marked "Defendants' Exhibit No. 13.")

The Black Canyon project is shown in yellow on the map. It is between the Boise and the Payette Rivers there. There is no point in the proposed Black Canyon district that is more than 10 miles from a present station on one of the Oregon Short Line roads. Your shipping point there could by Nyssa, Oregon; Parma, Idaho; Notus, Idaho; Caldwell, Idaho; or Middleton, Idaho. Those points I have just named are on the main line, and New Plymouth and Fruitland on what we call the "pumpkin" line, the Payette Valley line.

I do not know how much further it is from Emmett or Nyssa to San Francisco by way of the proposed line, or by way of Wells, Nevada, how much further it is than by way of Crescent Lake. (403.) I haven't checked those distances. There wouldn't be anything from the Black Canyon shipped from Emmett. It would be a back-haul. It is close, but then you are hauling up the other way. There might be a few melons shipped from Emmett, because the Black Canyon is taking in some of that melon territory, but that is about the only thing that would come from Emmett Station. Nearly everything would come from Nyssa, Fruitland, Parma, New Plymouth, or Notus. I haven't checked the distances, none at all. I don't care to testify on anything that can be (404) checked out in a better manner than I can think of. (405.)

208 Q. (By Mr. SPENCER.) Now, Mr. Madden, the question of markets, I believe, we were discussing at the time of adjournment. Isn't it true that many of these irrigation projects have been and are in suspense because of this question of over-production and insufficient markets?

A. In Idaho, Idaho projects?

Q. Well, Idaho and elsewhere.

A. I don't believe that that is true of southern Idaho projects.

Q. Isn't it true that your southern Idaho people were opposed to the development at this time of the Columbia irrigation district, that large reclamation project in eastern Washington, because you were coming on now with the Owyhee and that the over-production would be so pronounced that you should wait for the markets to be able to expand and absorb?

A. I think, Mr. Spencer, that that condition was on account of funds. Our people wanted funds for their own projects, and if the funds went to the Columbia Basin project they would not get their funds. I do not imagine the correct reason was assigned. But I don't know that there was very much objection in southern Idaho there—if there was I didn't hear it—to the Columbia Basin project. I don't want to be understood as saying that there are adequate markets for everything we can produce. (406.) Take the potato,

the situation to-day is that there is practically no market for the Idaho potato. There is an over-production of potatoes in the United States this year. In the last two or three years the Idaho potato has been marketed all over the United States. But whether it can be grown at a profit depends altogether upon how short the potato crop is in the United States. This year there is a
209 big crop. We have had, though, a very diversified market throughout the country for our products.

Q. Now, that is a more important problem than whether you go to San Francisco by way of Rogerson and Wells, or by way of Ogden, or by way of Portland, or by way of Crescent Lake, isn't it?

A. The main thing is to get to market with the least possible cost and in the most expeditious manner. The shortest route is not always the (407) most expeditious one. If there is not enough traffic to maintain a traffic density, it is true you can't maintain the character of railroad or give the service that you could if you had the traffic.

Regarding page 1, Exhibit 9, as to the areas capable of irrigation, checking up with the State engineer's office, I believe that that is practically all irrigated. (408.)

Q. Now, are they settled and in cultivation, or simply by irrigation do you mean they have water available?

A. I mean farmed and water applied, crops growing. That comprises all of the irrigation projects in the southwestern counties.

On page 2 I refer to the cultivated dry farmed land. I refer to the State board of equalization as having made this classification. I will explain that in this way, Mr. Spencer: The assessors of the various counties assess the lands and classify the lands. And of course that is shown in the report of the State board of equalization. Now, then, I assume that that is very conservative, because the assessor of each county wants to hold down his valuations (409) as much as he possibly can in order to avoid State tax. I assume that on the whole these officers do attempt to function properly and do their duty and make a proper assessment and proper return.
210 I think that an assessor is usually very conservative on his acreages and valuations.

Q. On his valuations; but he would have the acreage in correctly, wouldn't he?

A. Not necessarily. Over with us the State board of equalization will raise or lower one class of property. Say, where irrigated land is assessed at $75.00 an acre, or something like that, if he can throw some of that land in a lower classification he will do it, if he possibly can, in order that his county won't spend more than what he considers its just share of the State tax. And naturally if this is not dry-land farming he would throw it into a grazing class, or into a lower classification in order to avoid his county spending any more of the State tax than necessary. This is equalized here on page 2. (410.) I think it is conservative. I assumed it was fair.

Q. Now the capital investment here on page 3—how many of those are Government projects?

A. This is classified by counties rather than by projects, and I can't tell. Page 1 is classified by watersheds. I can't tell by that how many of them are Government projects.

Q. Are your reclaimed lands in southern Idaho so situated with respect to the Snake River that they have been reclaimed at a cost per acre as reflected on sheet 4 of your Exhibit 9?

A. This is according to the Government census reports. It is true; yes. (411.) This is as I understand it. Page 4 of Exhibit 9 is presented to reflect the cost per acre of reclaiming, of putting the water on the land, so that the farmer can turn it on and use it and proceed with his cultivation.

Q. It includes, as I understand you, to the extent that it may be necessary, the levelling and the building of ditches where required?

211 A. No. My understanding there, Mr. Spencer, is that this is simply the construction of the canals, construction of irrigation works. It does not have anything to do with levelling the land, or anything of that kind. It is nothing else except the irrigation works themselves.

Q. Well, I meant the canals. I should not have said the ditches and the levelling. I appreciate that is not the case. (412.) But in all the Government cases that is true, isn't it?

A. That is true that it is not.

Q. I notice by the official publication by the Department of Interior, in a publication prepared under the direction of Dr. Elwood Mead, Commissioner of the Bureau of Reclamation, published by the Government Printing Office in 1925, speaking of the Owyhee reclamation project, at page 142—"The total estimated cost of the project is $17,404,000, divided as follows: $139 an acre for new land not now supplied, $126.50 an acre for lands in pump districts and $25.00 for lands under the Owyhee ditch." In fact, this Owyhee project is reflected upon this map, Exhibit 13, is it?

A. The Owyhee project, I think, is not reflected upon that map at all, Mr. Spencer. That shown in yellow on the west bank of the Snake near the junction of the Oregon eastern branch and the main line of the railroad is the land under the old Owyhee ditch. (413.) It has been there 40 years, that in yellow.

Q. Well, what is the green down there between the yellow and the river?

A. I think perhaps you are right, although this map is not correct, because most of the Owyhee project lies south of

212 Ontario and west of Nyssa. I think there is traced out a canal line coming out, well, from a point just east of Vale; then it swings off a little south and east towards the Snake River, and then doubles back west again, and then south, and then swings off into Idaho. Now, I think, if you had colored that you would have

the Owyhee project, but you do not have the Owyhee project colored on your map. The only thing you have is what they would call the Dead Ox Flat division of the Owyhee project. That is in north of Ontario, containing about 15,000 acres, if I remember rightly. You have perhaps 15,000 of the 140,000 in the Owyhee project colored in yellow, as I see this map. The words "Owyhee project" are on there. Between those words and the Snake River there is an (414) outline commencing with the figure "3" down on the base there—the Boise base line. And then it meanders up there, crossing the Owyhee River and the Malheur River, and extending along the margin of the yellow to opposite Weiser almost. That is the Owyhee district. Now, if I remember rightly, Mr. Spencer, Dr. Mead does not recommend building at the present time the portion that you have colored in yellow there. I think that his recommendations are for the portions south of there, if I remember correctly. You have the Vale project, but not the Owyhee on there. The Vale project has been under construction for a year or so. (415.) It will be under construction for I don't know how long. For this Boise project the duty of water is determined to be 4.6 acre-feet diverted and 3.22 acre-feet delivered. That is just about the average on the Boise project that is required.

Q. And the Boise project is the large one appearing here in green and marked "Boise project" on this Exhibit 13, and is served by the Arrow Rock Dam Reservoir?

213 A. You have in green here all of the lands served from the Boise River. About half of them are the Boise project and about half of them are older settled lands than the Boise project. The Boise project is a Government project, but perhaps 150,000 acres were in cultivation before the Boise project was constructed.

The Warm Springs project is not connected with the Owyhee project; it is an irrigation district, and that is not a Government project. The Warm Springs project includes the low lands along the (416) Malheur River there, both south and north of Vale, and some on Willow Creek; yes; around Vale. Vale would be about the center. That is shown there on the map approximately right.

Q. Now, the water for that is taken from the reservoir south of Drewsey, and between Drewsey and Riverside, and carried down the Malheur River to Namora?

A. It is carried down the Malheur River and diverted at about what they call Divine's Hill, I guess, about 8 or 10 miles above Vale on the Malheur River.

Q. How do you account for this great expense reflected by Dr. Mead's study as compared with this average expense, or this expense that is set forth as of 1920, on page 4 of Exhibit 9?

A. Most of the earlier projects along the river irrigating the lower lands were simply diversion dams; well, a good many of them had no diversion dams at all in the river, and they used sluices and almost anything to carry the water; so the cost was practically nil.

Then as they began irrigating the higher lands they had put in reservoirs and higher diversion dams (417) and all of those things, but they were reclaiming better land.

Now, in the Boise project—the Boise project, I think, if I remember rightly, irrigates 146,000 acres of new land in the Boise
214 project. That cost $77.00 per acre, but inasmuch as the older lands cost practically nothing, very little, it held the average down to $34.00 or $35.00 an acre; something like that.

Q. What do you mean by this on page 4 here? You have got all the lands in Boise County as having cost only $10.50 an acre?

A. I imagine that would be about the cost of those irrigation canals in Boise County in 1920. (418.) I don't think they have made any expenditures in Boise County since then.

Q. When was the Arrow Rock Dam completed?

A. Oh, in Boise County? Now that is charged not to Boise County, because there is not any land irrigated in Boise County from the Arrow Rock Dam. That is all in Canyon and Ada Counties in Idaho, and Malheur County in Oregon, that is irrigated from the Arrow Rock Dam, but nothing in Boise County. Boise is the county seat of Ada County.

On page 7 of this same exhibit I give the value of livestock on the farms in 1920 as $28,800,000, and in 1925 as $12,800,000. One reason for that shrink is the fact that they have shipped out so much of their livestock and disposed of it. It is my judgment that since 1925 the value of livestock has increased to a level substantially as high as it was in 1920; that is, I think, if a census were compiled now of the value of the livestock on the farms in these counties, it would just about be where it was in 1920, because the values have increased and the numbers have increased. (419.) On direct examination I distinguished between those that were on the farm and on the range. That was not because I was putting a higher price on the dairy herds and a lesser price on the beef cattle. I know of an instance, within the last two weeks, $100 a head was offered
215 for cows and calves, range cows and calves out in the Jordan Valley country. Now in 1923 or '24 they could not have gotten more than $35.00 a head for the cows and calves.

Jordan Valley is in Malheur, about 3 miles from the Idaho line. Caldwell is the nearest point. It is south of Caldwell about 60 miles—south of Nyssa about 60 miles. But this is a stock country in there purely. You have the Jordan Valley irrigation district indicated on the map, Exhibit 13.

Q. The town would be a little bit north and east of the Jordan Valley district. (420.) Is that right?

A. Yes; it would be north of the Jordan Valley district, within about 3 miles of the Idaho line; so that would put you in township—if I remember rightly, the town of Jordan Valley would be in township 31 south, range 45 east. You can locate it that way, Mr.

Spencer. The valley itself is 65 to 75 miles to the nearest railroad station, Homedale branch, that goes into Nyssa. It connects with the main line at Nyssa. By Homedale branch I mean that branch line that appears on Exhibit 13 along the west bank of the Snake River, extends into the so-called Gem irrigation district. It is marked "Homedale branch," connecting with the main line at Nyssa. I think it is 62 miles from the town of Jordan Valley to Homedale. (421.) The valley is south and west of the town. I think there would be perhaps 25,000 acres of irrigated lands in Jordan Valley. Most of it is flood irrigation. Hay is the principal crop. The older part of the Jordan Valley is all wild hay. Now the irrigation—in the Jordan Valley project down there, I think, is only five or six thousand acres in cultivation; I don't know. The 1,500 in cultivation is alfalfa. There is no other cultivation than the 1,500 (422) on the Jordan Valley project itself. It is small.

216 I said that one of the ranchmen in there the other day was offered $100 a head for cows and calves. The steers are probably worth more; but for cows and calves, that is, the one head, the cow and the calf, one head. They would not give $100 for one cow and $100 for one calf, but they would give $100 for cows and calves. As to whether weaners are selling for $50.00 right now, I don't know about that.

I haven't any estimate on the value of southwestern Idaho crops for any year since 1920.

Q. Now, you were not into the Los Angeles market to speak of at all, until after 1923, were you—southern Idaho? You didn't do any business to speak of, or enjoy any participation to speak of, in the Los Angeles market, until after 1921, did you, for your crops in southern Idaho? (423.)

A. Not so much as now.

Q. And now it is more important to southern Idaho than all the coast markets combined, Seattle, Portland, Oakland, and San Francisco. Isn't that true?

A. The Los Angeles market?

Q. Yes.

A. It is to southeastern Idaho, that is, from Twin Falls east;. but I think it is not, so far as our part of the State is concerned. I am not sure about that.

In regard to page 9, Exhibit 9, corn: This is from Government sources. They make the estimate; I don't

Q. I am not questioning the estimate, but how did it come about there was such a big increase in corn there between 1920 and 1927. Where is it raised?

A. Most of the corn in Idaho is grown in Payette, Canyon, and Ada Counties. A good deal of the corn is fed there. I think

217 practically all of it is fed except that corn that is canned. There is a cannery at Payette and a cannery at Wilder, Canyon County. As to whether this is stock or sweet corn (424)—he

simply says corn. The most of it is field corn that is fed. It would not be fed as ensilage, or they would not include it in bushels. There is no tonnage that I know of in the shipment of corn from Idaho. I think that is practically all fed to hogs and cattle and sheep. Sometimes we import corn into Southern Idaho. I am not sure that it is every year.

I estimate there 24 million bushels as the potato crop. That appears to be high, although there is a big potato crop in southern Idaho this year and the condition of the crop is excellent. I think about 16 or 18 million bushels is the highest crop we ever claimed to raise up to 1927. (425.) The estimate of 24 million bushels is from Mr. Jacobson, the Government reporter at Boise. There would be some to go to San Francisco via the cross-State line, but it would depend upon the market. The movement of these crops, which are our basis crops, depends upon the market and demand from all over the country, as to how it would be routed. All of these crops are grown in southern Idaho. There are none of them grown in northern Idaho, to a large extent, except grains, wheat, and oats. They are grown around in the Moscow country and in there. (426.) The others are all grown south.

As to when the Black Canyon irrigation project is going to come into operation, that depends upon the Bureau of Reclamation. There is an appropriation now of $900,000 awaiting the approval of the President. Dr. Mead, within the past two weeks, has signed his certificate of feasibility and sent it to President Coolidge for his approval. So far as I know he has not yet signed it. But it
218 has passed Congress and it has passed Dr. Mead, the Commissioner of Reclamation. It has passed everything except the President. I migh say the Government has already expended $2,000,000 on the dam at Black Canyon, and $450,000 on a power plant. It has gone that far. (427.) That was several years ago. I think the power plant was built within the last three years, something like that; and the dam was built prior to that. That dam serves the Emmett irrigation district of about 22,000 acres, but it is not on the Black Canyon district. All of these projects are a matter of rather slow construction.

As to whether the estimate of Dr. Mead is 5 or 6 years before the Owyhee reclamation, I don't know. I am not familiar with his estimate.

Q. Now, you don't know, from Exhibit 10 here, how much of this $91,000,000 is invested by the Government, do you? (428.) You have got $91,000,000 invested already in irrigation works over there?

A. Well, the Boise project cost about $11,000,000—not to exceed $20,000,000. The American Falls project is more recent than this. That would run her up a few more millions. But that was conceived and built since 1920. It was to furnish additional water required for districts that were already producing, because they didn't have sufficient water and also to add more land, to bring more land

into cultivation. But that does not come within a good many miles of being into the counties under consideration.

Q. But you have got all of southern Idaho? As I understand you, this is irrigation development in the State of Idaho, U. S. census?

A. Yes, sir; that is true, on this exhibit.

219 Q. Now, it is true, speaking of the American Falls project, that in the early estimate the duty of water was made too low (429) and the estimate was not sufficiently severe. Isn't that true?

A. On the American Falls?

Q. On any of these projects there in the early ones. The Twin Falls project, for instance, has suffered because of inadequate water supply. Isn't that true?

A. Not of the original segregation on the Twin Falls project. There was 120,000 acres, if I remember rightly, originally in the Twin Falls project. But there are other projects out there. Now the Twin Falls north side, and some of those projects that were constructed by private enterprise, where the promoter was interested in a profit and was interested in selling bonds, and a good many of those projects have suffered very much.

Q. Yes. And this American Falls expenditure of millions of dollars by the Government was made primarily to take care of those projects to the end that they might have adequate water?

A. That is true of the projects, both above and below American Falls. I don't know of any project where the duty of water has been as high as 1½ acre-feet. (430.)

Q. Now how is it, then, that in this Owyhee project, Dr. Mead determines the duty of water to be 4.6 acre-feet? That is in the reservoir, I assume?

A. Yes.

Q. And 3.22 acre-feet delivered?

A. Yes. Well, that is a lower duty than 1.8 acre-feet. Just get me; this is what I have in mind, Mr. Spencer: If 1.8 acre-feet

220 of water can irrigate an acre of land, it is doing a higher duty than if it takes 3 acre-feet to irrigate. I hardly think they have increased the volume of water that is required to reclaim these lands in recent years. I believe that we are using as little water now per acre as we ever had.

Q. Well, you had to provide more, but you say three and twenty is about right. Is that right?

A. Around 3 acre-feet; yes; between 3 and 4 acre-feet. It depends upon the crop and the condition of the soil. (431.)

Q. Now, I understand from your testimony that you attempt to say that these products that are going to the coast from these 10 southwestern Idaho counties are going by the cross-State line, do you? Do you want to give that as your opinion to this commission?

A. I have this in mind: A lot of our shipments take hogs and cattle, and a good many other shipments, if we had the cross-State line, would move across the cross-State line and would probably be diverted north or south, depending upon whether there is a better market in Portland or Seattle than there is in San Francisco. For instance, in the livestock market it might break, and it breaks very quickly within 24 hours.

I don't know who started this diversion proposition of livestock at Crescent Lake connection with the Southern Pacific.

Q. Mr. Teutsch was talking a lot about this diversion north and south. Well now, if livestock is over here at Ontario on the main line of the Oregon Short Line at a given date, it will go from Ontario through to Portland, and even to Seattle, without an unloading for water or feed, won't it?

A. Well, I know of shipping from Caldwell, that is approximately 35 miles the other side of Ontario (432), they always unload some place along the line, usually at Huntington; they usually feed
221 at Huntington when they ship to Portland. That is true a number of years ago. I haven't paid any attention to it now. That was 8 or 10 years ago.

Q. Don't you know there is a livestock special operated over to the coast from Nampa west and goes through without any unloading, within the prescribed time?

A. I don't know. I didn't know it ran from Nampa west without unloading. I am not doing shipping.

Q. Now if that is the condition, why shouldn't a man determine, when he is shipping at Nampa, whether he wants the Portland (433) market or the Seattle market or the San Francisco market rather than call for the investment of millions of dollars in a railroad across the Oregon desert?

A. He can't always tell what the market is going to be when he gets here. I can't.

Q. Don't these men know and keep in touch with the market and get their information every day, so that they won't get together and crowd the market? The market in Portland and Seattle is a limited market, isn't it?

A. It is a limited market, and the market has broken as high as $1.00 a hundred between the time that the trainload of stuff would leave southern Idaho and the time it would get to Portland. Most everything, I think, is shipped to Portland.

Q. And the buyers from Spokane and Seattle, and all of them, trade there in the Portland market?

A. I can't imagine that anything would be shipped from southern Idaho to Portland and then back to Spokane. (434.)

We don't ship very much stock to San Francisco. The buyers from California go into the Portland market to buy.

Q. And their presence in the Portland market makes a
222 favorable price, the more buyers you have. Isn't that right?

A. It should be true.

Q. Now they won't congregate around on the shores of Crescent Lake to discuss livestock prices, will they?

A. No; I imagine they would not.

Q. Well, where are you going to have this assembly and determine what the markets and the prices are to divert your stock?

A. Well, it would depend very largely on what happens to the market between the time that it leaves the point of shipment and the point of destination arrival.

Q. Now, is there any other commodity from these southwestern counties that you can think of that would be particularly assisted if the cross-State line was built?

A. Yes. The matter of the movement of range stock back and forth (435) for feeding purposes. We grow chiefly in southern Idaho. If we could have that cross-State line, Oregon livestock would go to southern Idaho to feed, I imagine, or northern California. Sometimes they have a drought in northern California.

Q. Have you got any feeding lots that are any more extensive or potentially any greater than in the Klamath Falls Basin?

A. I don't know about the Klamath Falls Basin. But there is a lot of territory between Boise Valley and Klamath Falls.

Horses are pretty well off the range now. These range horses, or range cattle, that are coming in to southern Idaho from Oregon, are not produced in southwestern Idaho counties.

Q. What other products of southwestern Idaho will go via
223 the cross-State line and work to the advantage of (436) the producers of those 10 counties and put them in any better shape than they are in now?

A. Well, it strikes me that almost any of our products that move now to California could move better over the cross-State line than over a longer route, that is, anything north of Bakersfield.

Q. And do you know whether there has been any increase north of Bakersfield in your shipments to California since the Rogerson-Wells line was built, which cuts off several hundred miles from the original Ogden route? Has it made any effect?

A. It has not made any difference in the rates, I understand, and there is very poor service over that line. It is not used very much.

Q. Well, if you don't tender the stuff to ship, how can it be used and how can the cross-State line be used?

A. The Wells-Rogerson cut-off is out of our part of the State. It is down in the south-central part of the State. We think just as kindly of the south end of our State as we do central Oregon. (437.)

Q. With respect to these carloads that are discussed on page 13 of Exhibit 9, "They" assumed ⅓ to be available to the cross-State line. Who are "they"? Whom did you have in mind?

A. That is purely arbitrary; that is mere guess. That was probably a misstatement on my part, if I said "they." I don't recall

that Mr. Teutsch suggested that to me. I discussed the matter of what would be available for the cross-State line with him, at Boise.

(438.) He was over at Boise. I do not think I discussed it
224 again with him down here. I prepared Exhibit 9 at Boise. It was printed at Boise. I don't say that Mr. Teutsch and I agreed on a third of the products of southern Idaho counties to be put over this cross-State line. We discussed a number of things. We discussed what the available tonnage would probably be. (439.) When we parted, that was the conclusion we had arrived at.

Referring to page 14, Mountain Home of 400,000 acres would be between Boise and Mountain Home. As to whether it would require a tunnel 40 miles long through a mountain range to use it, I don't know. The waters for that project, 400,000 acres, would probably come from the Salmon River.

Q. Now if it happens that you have got to build a tunnel through a mountain 40 miles long as a part of the expense of this reclamation, it will be a long time before the cross-State line gets 4.444 carloads of traffic from that Mountain Home project, won't it?

A. That will be very slow development; yes.

Q. Now this Bruneau project here, 280,000. (440.) The State engineer of your State has determined that not to exceed 100,000 acres of that project can be furnished with water. Isn't that true?

A. I don't know. Our former State engineer, Fred Wilkey, insisted that the whole thing could be irrigated. That was in 1918, I think. I haven't followed that closely since.

Q. All these rugged developments here that call for reclamation of about 2 or 3 or 4 thousand acres must be financed by the Government? Everyone accepts that as true, don't they?

A. Private enterprise has been trying to finance these projects, but I don't believe that it can be financed by private enterprise.

225 A. Now on this Mountain Home project, Mr. S. H. Hayes, former attorney general of the State of Idaho and former mayor of Boise, has been very active in the past few years in attempting to finance this, and it is very largely upon his activities (441) there that I put this in—upon his standing. He has not raised the money for that 40-mile tunnel, that I know of.

I think it is true that with this Bruneau project it will be a great many years before that will furnish 3,111 carloads for the cross-State line.

The American Falls irrigation project would not bring anything under irrigation in any of these 10 counties. It is further east. I do not know how much additional land, not now irrigated, that they will bring in ultimately. I haven't retained that in my mind, although Mr. Hayden, of the Reclamation Service, told me. (442.)

As to how many acres there are in the present Twin Falls project that are in cultivation and bearing, including the north unit, the whole works over there tributary to that Rogerson-Wells line; that is out of my territory entirely. It is nearly 200 miles from Caldwell

to Twin Falls. But there are 180,000 acres in the original segregation; that is in the south side of Twin Falls. I would judge about 250,000 acres of land that is now in production, and which has access to the San Francisco and Oakland markets.

Exam. ROGERS. Mr. Madden, on page 9 of your Exhibit 9 what part of this production can be associated with this cross-State line?

A. That depends altogether upon where our best market is. We (443) have not been able to get into the San Francisco
226 market as well as we think we should. And then it depends, as I said a while ago, we have an outlet down there that lends itself to a first-class market, and wherever there is a demand for any of the crops that are grown in temperate climate we can furnish that crop if they furnish the demand.

Exam. ROGERS. But what inference would you have the commission draw from this exhibit, in passing on this cross-State line?

A. It will have to take that in connection with Mr. Newton's testimony as to where our commodities move to. That is all.

Exam. ROGERS. Mr. Newton assumes, as I remember it, that all of the present all rail movement between San Francisco and these 10 counties would be over a cross-State line, and you say now that you don't have any market with San Francisco?

A. No; I don't say that we don't have any market. We haven't got in there as well as we feel that we should get in there; and, furthermore, if we get better connections with San Francisco we believe that our market down there will double. I don't know what our present market is now to San Francisco. I think Mr. Newton's testimony would give that. I didn't compile any information on that. (144.)

Exam. ROGERS. What part of this tonnage on sheet 9 can we take as moving over the cross-State line?

A. I haven't any information on that, Mr. Rogers.

Exam. ROGERS. But you can readily see, Mr. Madden, unless this is to be associated in some way with the cross-State line it won't mean very much in this case, will it?

A. That will have to be taken in connection with Mr. Newton's exhibit on the car movements. In itself it does not mean
227 anything, except in connection with Mr. Newton's exhibit on the movements, where our markets are. I haven't made a study of our markets, as I have of our production. That would also be true of most of the data on page 11.

Exam. ROGERS. Now on page 12 of Exhibit 9, is any of that land, this 24,500 acres, included in the exhibit of Mr. Teutsch?

A. No. I think Mr. Teutsch just simply took that portion of the Owyhee project that lies within the State of Oregon. (445.) I didn't understand Mr. Teutsch was including anything in the Owyhee project in Idaho. That would also be true of the 476 carloads shown on page 13. If one is a duplication, the other would be.

Mr. TEUTSCH. Mr. Examiner, by way of explanation there, as I take Mr. Madden's exhibit, the only duplication would be on new lands in Idaho, on which he estimates, I believe, 624 cars would be originated. On the Owyhee project how many cars do you estimate will originate to move west over this cross-State line?

A. 476.

Exam. ROGERS. Referring now to page 14, if your present markets do not absorb your present commodities, how would you be able to dispose of the commodities that would come from these projects on page 14, if they were actually developed? (446.)

A. That is our problem.

Exam. ROGERS. Well, how can we connect that up with this cross-State line?

A. Well, if there is a market in California for additional products or for additional produce, that would solve it.

228 Exam. ROGERS. But if there is not a present market for present products in California, what will the situation be when these projects come into bearing?

A. There is a present market for present products, because we are shipping a lot of stuff to California. The cross-State line would give us a better route to California, a shorter distance in shipping. I think it would increase the shipment on almost any commodity. We expect the cross-State line to decrease the time of transit and also decrease the rate. (447.) If it does decrease the time in transit, it would cause a different situation on livestock; on perishables of any kind it would be.

Exam. ROGERS. Let's take the commodities on page 9. On which of those would a shorter time, leaving out the consideration the rate, have effect?

A. The commodities on page 9—there would be very little of that that we ship to California. Uniced potatoes would be about the only thing that the time would make any difference with on that particular page.

Exam. ROGERS. What difference would you say 24 hours would make on potatoes?

A. Of course, if the potatoes are matured. I don't imagine we would be shipping many uniced potatoes into California. Those are potatoes that we ship in July. They move in refrigerator cars. (448.) We do not expect these 24,000 bushels to move in refrigerator cars, because the potatoes that we ship out, the early potatoes that are not matured, are the ones that move in refrigerator cars. Later potatoes do not. I do not know what portion of the 24,000 bushels would be those early potatoes moving under refrigeration;

229 I would hardly say 20 per cent. There are a good many moving under refrigeration, but I haven't the information on it. If the potatoes did not move under refrigeration, a period of 24 hours would not make very much difference. (449.) In com-

puting the tonnage which we expect to move from these 10 counties over the cross-State line I have not given any thought to the revenue which that tonnage would produce to the carrier.

When I spoke of two or three trains a week over the Rogerson cut-off, I had in mind freight trains. I haven't any real information on that. If that were true, and it was freight trains, it would mean to my mind that the carrier was not giving the service to that line that it ought to have.

Exam. ROGERS. Well, what if these three trains a week were sufficient to move all the traffic that would be routed that way properly? Would that cut any figure?

A. I have the impression that the amount of traffic that is routed depends a little bit on the service it receives, as well as that the service is dependent upon the traffic.

Exam. ROGERS. Do you have in mind that the traffic which should go over this cut-off is now going some other route? (450.)

A. I don't know. I would say that is out of our part of the State, and I rather suspect it is going around by the way of Ogden.

When I referred to the service over that cut-off not being more than two or three trains a week, I had in mind that the service at present is unsatisfactory and the shippers are not shipping that way, are not routing that way. But I haven't gone into that. Remarks that I have heard led me to that statement. I haven't made any investigation of it.

230 As to what outlet to the west we would have if the proposed line was constructed that we do not have now, it would put us in direct touch with all of central Oregon and northern California, western Oregon, that is, over as far as Eugene. Central Oregon is a stock country up there very largely. (451.) I am not familiar enough with that country to know just what would happen, but I think our largest benefit there would be the movement of livestock back and forth. I do not know what our trade outlet would amount to in the territory west of the Cascades but north of Eugene. I am not familiar with that. As to what we would have south of Eugene and west of the Cascades, it would make a more direct connection there of a few hundred miles, to any point that is south of Eugene; to everything between Bakersfield and Eugene. I haven't checked as to by how many miles.

Exam. ROGERS. How many miles would it have to be in order to make these available outlets mean much to the Idaho farmer?

A. I think in shortening the distance there it will help. (452.) It will help in the movement of our commodities. Our crops are not shown anywhere in my exhibit. I haven't included our dairy products. My understanding is that is to be included by another witness. For instance, Idaho produced about 21,000,000 pounds of butter a year. About one-fourth of that is produced in Canyon County. (453.) That goes very largely to California.

As to how Los Angeles compares at the present time with San Francisco as to accessibility to southwestern Idaho, as to distance I haven't checked it. We market more produce in Los Angeles than we do in San Francisco.

Exam. ROGERS. Why is that? Is it because Los Angeles is more accessible than San Francisco?

231 A. Very possibly the market has been able to absorb more of our products under existing rail conditions. If we had quicker service and a lower rate to Los Angeles, for instance, it is quicker and easier to ship to Portland than it is to Los Angeles. If it were (454) shipped quicker and easier to ship to San Francisco than to Los Angeles, we could ship there. We sell a lot of things in Portland, but it don't absorb all there is, by any means.

Shorter time and a lower rate is not helping us to Portland, but it would go to San Francisco. We are marketing a lot of stuff now in San Francisco, but I haven't the figures on that, though. As to whether we now have a shorter time and a lower rate to Los Angeles than to San Francisco, I don't know. I haven't the data on that.

Exam. ROGERS. Then, if that be true, how do you know that if you had a lower rate and less time to San Francisco than to Los Angeles, that the movement would be to San Francisco, if you don't know now which is true?

A. Well, I can make this statement: I have just simply prepared a statement of what our production is over there and the stuff that we have to sell. I am not prepared to make an argument; it is just simply a statement of our conditions there. (455.)

Redirect examination:

Q. (By Mr. ELLIS.) With reference to Exhibit No. 13, which is the irrigation map, I am wondering whether in your Exhibit No. 9, on pages 13 and 14, you have made any estimate as to the number of cars of commodities that would move over the proposed cross-State line from the area in southwestern Idaho shown

232 in the green color on Exhibit 13, or did you include only estimates of a portion of the area shown in yellow?

A. Oh, those estimates were made only on the new projects coming in. I don't make any estimate on those existing projects which are shown in green. My estimate covers the yellow portion only, within the State of Idaho; and there should be a yellow portion south of Snake River within the State of Idaho, but it is not colored; that is, on the Owyhee project. The map, Exhibit 13, does now show in yellow all of the projects now under construction. (456.)

In addition to talking with Mr. Teutsch, I consulted other sources of information or other people who are familiar with this question. I got the best informed advice I could before I came here to testify.

The Portland market on livestock is a very limited market. That is one of the principal reasons why we are anxious to get a shorter

route to San Francisco. We feel that that condition, the limited market in Portland and the circuitous route to San Francisco, has, to a large measure, discouraged the production of livestock in Southwestern Idaho.

Recross-examination:

Q. You don't mean that the Portland market is not just as good a market in price as the San Francisco market is, or (457) do you know anything about that?

A. Well, I think not. I think on an average, take it over a period of years, the San Francisco market is higher. That has been my observation. Just now I am inclined to think the Portland market is about as good as San Francisco. I think there is not
233 very much difference now, but over a period of years I think the San Francisco market has been better. It takes a higher rate to get to San Francisco.

These estimates here are just for these additional projects.

Q. You mean to say that your estimate on page 11, Exhibit 9, has anything to do with these additional projects? What ones are associated with your additional projects?

A. Pages 12 and 13. And the first two sections of page 14. Those are the only tabulations that are related to the additional projects. (458.) The principal commodities are grain, sheep, hogs, poultry, butter, eggs, and potatoes.

Q. Now, you don't expect to ship, or to obtain a consuming market, for any of those products in the Willamette Valley or in the Rogue River Valley in western Oregon, do you?

A. We might ship corn into the Willamette Valley. That is the only thing I can think of now. Corn is not there. We grow a lot of it anyway. We consume it too. Some years there is corn imported from Nebraska, when there is a low price on it back there and a high price for us.

Q. I want to ask you where, in western Oregon, you are going to sell any of these commodities and have them consumed, either potatoes, eggs, butter, poultry, hogs, or sheep or grain? Aren't they already produced and raised and exported from western Oregon now?

A. Our wheat all moves west, but I guess it comes into Portland. I rather think most of it moves west. This year it is just (459) a break as between east and west. I do not think the wheat generally as a rule goes to the south and the southeast from our part of Idaho. The dealers tell me they ship to Portland. Further east in the territory it all goes east.

234 Q. Have you got any of those commodities on page 13 that you are going to load into these cars for the cross-State line that are going to be consumed in western Oregon? I want you to name one of them.

A. Well, under grain I imagine corn would be the only thing we would ship into western Oregon.

Q. Isn't the dairy product listed there that you said you would save the time on and that they would move over that way?

A. This [indicating]? (460.) Now I see what this is. I just noted these were the principal products that would be first grown on the new projects. These are the things they can get into quicker than anything else. They can get into hogs and poultry and those products quicker than they can anything else, and those are the things that would probably be coming in in the next five years, on page 13. That is what I had in mind. That is the first products that would come in on them. You see, it will take five or six years to grow an apple tree, and there are certain of those products it takes longer to grow.

Q. But there won't be any of these consumed in western Oregon? As a matter of fact, you have got to compete with western Oregon? Western Oregon and the Klamath country will compete with you for the San Francisco market with its consumption of these very commodities, won't they?

A. The only quick commodity I can think of in this list we might ship to western Oregon would be corn and alfalfa. You are having to ship both into western Oregon.

I am acquainted in a limited way with the products of the Rogue River Valley in southern Oregon, and the Willamette (461) Valley. I am acquainted in a limited way with the Umpqua Valley. They raise poultry in large volume there. I imagine their
235 market would be both in Oregon and California. As to San Francisco I do not know. I do not know where they ship their cheese and butter. I know that we ship more cheese and butter to California than Oregon does. I am not sure it goes to Los Angeles, but it goes to California.

I have lived practically my entire life in the State of Idaho. (462.) During those years I have had exceptional opportunities to become familiar with the development of the southwestern section of the State.

Comr. McMANAMY. Now, is it your opinion, based upon that experience, that in the next one or two decades development will continue at the same rate that it has during the periods covered by your exhibits?

A. Not quite. I think that the greater rate of development is back of us. That is, that there will be future development, but it will not be at the same rate. The irrigation development can't possibly be as rapid as it has been during the past 20 years. The increased production that may come from lands now under cultivation will make up, in some degree, for the lack of future development in irrigation.

As far as westbound traffic is concerned we have the same outlet that we had 40 years ago. (463.)

Comr. McMANAMY. But you didn't intend to mean by that that the capacity of that outlet was the same as it was 40 years ago?

A. The Oregon Short Line and the O.-W. R. & N. are in better physical condition than they were 40 years ago.

Comr. McMANAMY. Well, there have been additional facilities provided in the way of double-tracking and shortening of
236 the line, reduction of grades, and all of that sort of thing, have they not?

A. East of us there has. The Oregon Short Line is not double-tracked all the way through yet. It wasn't double-tracked at all 40 years ago.

We have reduction of grades in the Blue Mountains, the Umatilla cut-off, and things of that sort. They all increase the capacity of the lines.

Comr. McMANAMY. Now, looking ahead for a period of, say, 20 years, do you think that the increases in capacity of the present lines will not be sufficient to permit the complete development of the southwestern portion of Idaho? In (464) other words, do you think there will be a lack of transportation facilities which will hamper development?

A. I should think so; yes. I should think that we—at least hope that we would have some more lines within the next 20 years. I think the development of the country will surely require it. That includes not only present lines but shorter lines, if routes can be found. I am not arguing for competition, or anything of that kind, because I feel if one system can give us the service and the rate, that is just as good as having competing systems.

Comr. McMANAMY. What I am trying to develop is this, Mr. Madden, if you can help me: Your experience in the State of Idaho, your knowledge of the country, and your opportunities for observation have been exceptional, and we have got to find some means of projecting that into the future, because clearly action in this case can not be based upon butter and eggs that are on the platform waiting for shipment, or cattle that are along the right of way now.
237 (465.) And your experience in the past ought to make your opinion as to the future of some value, and I wanted to get in the record fully your opinions as to what would be required to afford reasonable transportation service to the people of southwestern Idaho.

A. Of course, transportation is entirely out of my line. As to the needs, I really believe that within the next 10 years or so, just as soon as markets will justify, the production of those 10 counties will be doubled.

Comr. McMANAMY. Of course, the increase in production that has taken place during the past 20 years has been due to the development, not only of production facilities but also of marketing. The two must go together?

A. The two must go together, and we can't market without railroads. Now Mr. Spencer spoke of the Jordan country. That Jordan Valley project is practically a failure because it is 65 miles from

transportation, and the only thing they can grow is something for feed to their livestock and they have to drive their livestock to market. That is the project, not the valley itself. It is limited (466) because of transportation. Transportation is the first essential in our country. Without transportation we can't develop. (467.)

[File endorsement omitted.]

238 PORTLAND, OREGON, *August 6, 1928.*

J. W. SMEED was thereupon produced as a witness on behalf of complainants, and having been first duly sworn, testified as follows:

Direct examination:

I reside at Caldwell, Idaho, and have lived there 16 years this fall. I have lived in Idaho 33 or 34 years. My occupation is stockman or rancher. I own five ranches and I operate some of them myself, and some I rent. (468.) My ranches are located in Boise Valley, Idaho. I have been engaged in the livestock business twenty years in southwestern Idaho, principally in Caldwell. I buy stock in two or three different States. I buy and sell livestock and feed them for market, ship them to market; run some on the range. I operate a stockyard in Caldwell. I think my yards in Caldwell is the second largest this side of Denver. I have four hundred acres at Caldwell; twenty pens that are under shed for twenty carloads of stock. The outside pens will (469) accommodate 150 cars. I have pastures that are adjacent to the yards, that they use in connection with the yards for grazing sheep. In my livestock operations I operate in Idaho, Montana, Oregon, and Washington, principally; once in a while we get down in Nevada. In eastern Oregon we buy cattle and ship both for feeding purposes and for market—ship some of them direct to market, and we principally ship the feeders all home and feed them, ship them later when they are fattened out. My chief occupation is livestock business. I operate my farms incident to the livestock business. I am acquainted with the livestock business in southwestern Idaho and eastern Oregon. I have been acquainted with the livestock business (470) in southwestern Idaho twenty years. I think the conditions at the present time of the livestock business in southwestern Idaho is generally in pretty good shape.

239 In the last five years the livestock business in southwestern Idaho has changed. The prices are much better. A good many mortgages have been paid off by livestock men; the livestock industry on the ranches have increased. I don't think there is any material increase on the ranges. They are increasing as fast as they can under the present conditions. There has been a change in the livestock conditions on the ranges during the last five years. A good many of the rangemen have sold off their cattle and sheep in order to pay off their indebtedness. I think possibly sixty per cent of the young stuff, maybe seventy-five has been shipped to market. The sheepmen have been breeding black-face stuff for mutton, and sold both the ewe and (471) wether ends, that is, generally speaking.

There has been some young stuff saved, but not a great many. They are beginning now to save the ewe end and build up their herds, also in the cattle, but that is only in the last two years. In the last seven or eight years I would say the decrease in the livestock business in the range was fifty per cent. I think it struck bottom in '24. The conditions on the range now as compared with 1924 are better, owing to the fact that they have shipped lots of wild horses to canneries and have taken them off the ranges, the herds of cattle have been cut down in the last five or six years, and naturally the range conditions are getting better; there is less stock on it. (472.) They shipped lots of wild horses to the canneries, both here at Portland, and the Hansen's plant in Butte, Montana, and one in Nevada; practically cleaned up the ranges of wild horses that used to be on the range, use the grass for cattle and sheep.

I would say that the present tendency of the livestock
240 business on the range is toward the increase. I think the livestock conditions on the range will eventually come back to what it is, say in 1920. It will take some time to increase that back.

I am acquainted with the livestock conditions on the ranches in southwestern Idaho at the present time. They have increased in the last five years. I think, in our locality at least forty or fifty per cent (473), that is, in southwestern Idaho, eastern Oregon. I am fairly familiar with both places. I am acquainted with the market conditions for the livestock produced in southwestern Idaho and eastern Oregon and have been acquainted with them for twenty years. Our available markets for cattle and sheep and hogs is in Portland and Seattle. We do send some to Ogden, once in a while to California. The Portland livestock market is very limited. There is practically no sheep market in Portland or Seattle, only just a load now and then at different times of the year, but there is no regular sheep market in Portland or Seattle for any amount. We must look for our cattle and hog market other than Portland or Seattle either east or San Francisco or Los Angeles. (474.) It is not profitable to ship cattle and hogs to the East from our country. For instance, we can load a fat steer here and ship him to Kansas City or Omaha, and they shrink anyhow from a hundred to a hundred and ten pounds, and he is only a feeder when he gets there. By a "feeder" I mean—you take an animal that is what you might term fat here and ship him fifteen hundred or two thousand miles and he loses flesh and isn't a top animal by the time he reaches those eastern markets. The further you ship an animal the more he shrinks, and of course the distance in market con-
241 ditions is the price it costs you to get him there, and shrink, and feed bills, and expenses of that kind. In fifteen hundred miles we generally feed—we would not—in going with a train of stuff that might be termed fat stuff leaving here we wouldn't aim to feed them on the cars over twenty-six or twenty-eight hours.

Now, that all depends on the run and how (475) far you get them. Sometimes you may get quite a good run; other times we don't make so good. We generally figure about three hundred, four hundred miles, as far as we go on a feed. Sometimes you don't get that far; sometimes you get two hundred.

As to the Portland market—we will say that there's fifty cars in Portland yards to-day—there may be eighty; I don't know what there is—but they can handle on this market down here fifty or sixty cars very nicely, but if you get over that it is an over-supply of stock; consequently they generally take off from a quarter to a half dollar. I have known them to take off as high as a dollar and a half; but that isn't usual, but if you get up around eighty-five cars of cattle in Portland at any one time as a rule you break the market.

There is a market in San Francisco. Our most feasible market, if we had this new proposed (476) road, would be San Francisco. The market is there now. It it too expensive to ship there, both in shrink and feed bills, and the condition that your cattle would arrive in there on the longer route. We would probably have two more feed bills by going from southwestern Idaho by way of Portland to San Francisco than by the new proposed route. If we were shipping fifteen or sixteen hundred carloads of cattle to San Francisco by way of the proposed route, or by way of Portland, the feed and shrink would amount to something like a hundred and
242 five or six thousand dollars. I have figured that up, on 1,632 cars. The actual figures on it are $119,963.60. I have reduced it to a car basis. It runs around sixty-five to sixty-eight dollars a car. (477.) The expenditure all depends on how many times you feed; if you get a good run and only have to feed once, that feed will run around twelve or fifteen dollars a car on cattle, and about twenty dollars on double-deck hogs, fifteen to sixteen dollars on double-deck sheep; and then on additional run, say four hundred miles, after they have been shipped and unloaded two or three times the shrink gets less; that is, they shrink less per three or four hundred miles than they do on the start, and I figure that a one per cent shrink—that is what it figures out going to San Francisco. In other words, shipping on a long distance, when stock get tired, worn out, it takes them longer to fill back after you get them to market than it does on a short shipment.

I don't think the natural future development of the livestock business in southwestern Idaho would develop as it is entitled to develop under present accessible market conditions. We have in the Black Canyon and the Owyhee projects about seventy-five thousand acres of new land; it is all (478) going under water. At the present time every available piece of land in our country that is under water is being farmed. Naturally, each year we are producing more tonnage; as this land is farmed and fertilized, it naturally produces more, and we are getting a better class of farmers

all through our section, and we will produce thousands of tons more in the future than we have in past, including this new project, which is seventy-five thousand acres, or approximately seventy-five thousand acres, under these two projects, and would
243 be adjacent to this road and the one we now have. In connection with that, I might say that naturally all those farms will have more or less livestock raised on those farms, and that will go to market either over this route or some other one. With the present development of the livestock business in southwestern Idaho I at times find the present markets over-supplied. The future development, to a certain exent, would be retarded by not having more accessible markets. (479.) I do not class San Francisco as a market in that answer. We are not accessible to San Francisco market from our country at the present time. We do not count San Francisco as one of our available markets now. If the proposed road across central Idaho was constructed and operated, I think it would be a great asset to that particular territory, eastern Oregon, and southern Idaho. If it isn't constructed, I think, the development of that territory would be interfered with and checked. In southwestern Idaho hay is raised very extensively. We have to raise hay in our country, first, to fertilize the soil, and, next, as a forage. We raise large quantities of hay, which ordinarly is worth from five to ten dollars a ton, we will say. The last few years it hasn't reached ten dollars. That same hay in California to-day is worth $22.50 in the carload, that is, on board (480) the car, and delivered at California points. That is what the dairymen are paying for hay to-day. They do, however, in certain parts of California have a weevil restriction that I don't know whether it has been overcome or not, but we have the forage there, and raise it, and we can put it down there if we had the facilities to put it there with.

244 They raise anywhere from four to eight tons of alfalfa hay to the acre of ground in southwestern Idaho. Some get four cuttings, some three, and some two. I am acquainted over in the Gem District, in Owyhee County. They produce a lot of hay there. They used to claim up as high as nine tons, but I think around seven possibly would catch the majority of them.

In Colorado, of late years, the last few years, has been noted as one of the greatest (481) feeding points in that section, and that is due to two reasons—maybe more that I don't know about. The first is, they produce a lot of awfully good feed, that is, sugar beets and hay and grain. They are available to three or four good markets in a short run. People buy our feeder stuff in Oregon and Idaho and Montana, ship it to Colorado on through billing, feed up the stuff in that section, and then go to market. Now, the reason they like to do that, because when they get in Colorado and the market is right they can load their stuff, and on a short run they can get right into market. The reason, I think, this road is so vital

to our particular section, eastern Oregon and southern Idaho, that we have a better climate than Colorado does for feed, we have equally as good a feed, and we have the stock right here in these four States that could eat that feed up and be shipped to market, and San Francisco, as a rule, and other parts in California, is generally as good a lambs market and as good a cattle market, considering the difference in distance as we would have anywhere to market our stuff. At the present time we ship very few lambs west. There were a few shipped this spring from our country around to San Francisco by way of Ogden and Salt Lake.

245 They would ship stock in from Montana to southwestern Idaho for feeding purposes in case (482) there were more markets in that territory. We have shipped a good many ourselves, but it isn't practicable for people to ship cattle from Montana, we will say, or western part of Wyoming, back this way on feed-in-transit rates to come to the coast. Not that Portland hasn't been a good market—Portland has been as good a market this last year as anywhere, considering the distance that we had to ship it, but it is a limited market. For instance, I will say that in our locality there has been a time when there has been as high as three hundred thousand head of sheep fed there, and possibly a hundred thousand cattle—I wouldn't be positive how many cattle. Now, we receive our cattle in the fall of the year—they are received at about the same time of year, all our feeder stuff, practically all about the same condition, and they go on feed at about the same time and are fed practically the same kind of feed. Naturally, with a small difference of how a fellow feeds and gets his stuff ready, they are all about ready to market at the same time of the year, within two or three weeks. Now, we can't go east with them, haven't been able to for years, owing to the long ship. Now, we have to come to Portland or Seattle with them, and when you are in Portland (483) you are in Seattle and when you are in Seattle you are in Portland, as far as the market is concerned—sometimes a variation of ten or fifteen cents, and that will be taken up in the shrink; so that, for instance, if we were feeding what we should be feeding there in order to take care of our stuff even under the present conditions, let alone the seventy-five thousand acres that they are putting under water, we

246 would be at the mercy of Portland or Seattle markets to market our stuff, because, under the present conditions, with long shipment, additional feed costs, additional shrinkage, we can't afford to go to San Francisco or go east and compete with the other feeders that have the shorter ship.

I have prepared a proposed exhibit, giving the number of beef cattle, sheep, and hogs in the ten southwestern counties, from the 1925 census, and also carload shipments of cattle, sheep, and hogs from the ten southwestern Idaho counties, from 1921 to 1927. That is the exhibit which I had prepared. (484.)

(The statement referred to was received in evidence, marked "Intervener's Exhibit No. 14, Witness Smeed.")

In my opinion of 1,394 carloads of cattle they shipped in 1927, forty per cent would be shipped over the proposed line in case it was constructed and operated. (485.) As to how many carloads of sheep would be shipped over the proposed line in case it was constructed, that would depend on the market conditions. We have no market for sheep on the western coast now. There is a market in California, at San Francisco and Los Angeles. I would not be in a position to estimate the number of carloads that would be shipped over the proposed line in case it was constructed. We would be safe in saying that 50 per cent of the 482 carloads of hogs would go to San Francisco, or California points. (486.)

The conditions in southwestern Idaho are such that the hog industry, if an opportunity is given, will greatly increase. In order for it to increase more adequate market facilities and opening up new markets is necessary. As a stock man operating in southwestern Idaho, eastern Oregon, and Montana, the construction
247 and operation of the proposed line of railroad is a necessity for the development of southwestern Idaho. The accessibility of the San Francisco or San Francisco Bay markets would eliminate the flooding of the markets. For instance, I couldn't give the exact dates, but in July of this year hogs went off a dollar and a half on the Portland market in one day. Now, we had seven double decks of hogs off of our yards that day. Now, we had no way of knowing that the packers were going to take off a dollar and (487) a half, but we did know before the train was out of our district that there was a lot of hogs going to Portland; there was no place else to go with them. You will find markets that will go off 15 cents to half a dollar, even in the big eastern markets, but you don't find those drops of that kind on those markets. This 15 cents to half a dollar is per hundredweight. This dollar and a half is a dollar and a half per hundred. Some of the livestock that we now ship to Portland is resold and shipped on to San Francisco. I wouldn't say to what extent. There's quite a few feeder cattle and a good many feed cattle at different times of the year go to California. (488.) Those are purchased by California buyers at the stockyards and shipped on or commission men that work for them. The fact that the California market, or San Francisco Bay points, has available a population of over a million people, as compared with some three hundred and fifty thousand at Portland, is the important factor which makes it desirable for us to reach San Francisco Bay. When I speak of San Francisco markets, I have in mind all markets tributary to San Francisco. I don't think this would benefit us as far as the Los Angeles market is concerned, but I don't think
248 we particularly need Los Angeles if we can reach the other points. As to what advantage, if any, would there be in the cross-State line, so far as opportunities for diversion either to

Portland, Puget Sound, or to California points, I would say if I was loading a string of cattle in Montana for the coast market, we would say, Portland or San Francisco, if this new route came, when I got down, we will (489) say, to Pocatello, or to Nampa, my commission man would wire me that the market was going to be lower here by two to four bits, going to have a big run of cattle, and I would divert those cattle to San Francisco, or possibly I might divert them from San Francisco to Portland or Seattle, according to the way the market might be or the run might be. You take it at this particular time of year—now, we had this only two weeks ago; we loaded some cattle out of Montour—that is up in Idaho. They were grass cattle. When those cattle were gathered and ready to ship—and we have got to ship them; they are just like lemons or oranges; they spoil if you don't get them to market; in other words, they shrink—we loaded those cattle to Portland, because there was no place else to go, and we knew there was going to be 85 or 86 cars of cattle here and the market was 50 cents lower. Now, instead of those—those cattle were bought to sell on the market, or possibly within ten or fifteen cents of the present market, and when it went off 50 cents that caused a loss. Of course, that is generally expected, a little loss, but when they get up to where they take off six bits or a dollar that is serious. It can be eliminated by having other points to go to.

I think the fact that we might divert at the extreme western end of the cross-State line, at Crescent, and go either (490)
249 to Portland or Seattle, or any California destination, would increase the value of that diversion privilege.

As to whether our cattle could travel nearly the full width, or length of the State of Oregon to Crescent and yet not have traveled any additional distance, or extra distance, and that we would still be able to receive in our Los Angeles market by as short a route as though we had sent them from our shipping point around by way of Ogden, I don't know. I am not familiar with that. If the mileages show that that is the fact, it would be a big advantage to the livestock. There would be a saving in shrinkage and feeding costs of approximately $68.00 per car. That would indicate the increased value of our livestock at the shipping point. Those figures are made on cattle. There's three different figures made there, separately, for sheep, hogs, and cattle. I verbally put the figures for sheep in the record. There is a movement of feeder stock from Oregon points into Idaho (491); there has been in the past from California points to eastern Oregon and southern Idaho. When there is a grass shortage in California and sections of Oregon, there is a substantial shipment of stock into Idaho. At the present time—well, last year there was thousands of tons of hay in this Burns and Harney Valley country that wasn't worth $3.00 a ton, that if those cattle men in northern Califronia could have got up there to that it would have been practically fed up, because the grass, the summer

grass was there, and they could have shipped their cattle in there to that winter feeding last winter and fed that up and still had grass there this summer for the cattle to run on. That would have been an advantage both to the livestock men of California and to
250 the hay producers in Oregon. I think this cross-State line as proposed would facilitate that movement, largely.

As to what extent cattle are being driven over long distances to market at the present time, or to railroads, in past years there (492) has been lots of cattle driven from Burns and the Harney Valley country south to railroad, but they do have access to the Crane-Burns lines now, which may eliminate that partially, but I think even this fall that their markets will be enough better in California that it will justify them to drive those cattle 300 miles rather than to ship them over the Crane branch and out this way. If they were driven toward the California markets, Winnemucca, they would load them at Winnemucca and Wells and Alturas and Lake View. I am not just particularly acquainted with just where they do load those cattle, that is, the majority of them. There is a condition, however, that could be benefited largely by this road in the Jorday Valley country. Now, they drive to Murphy, and from there—Jordan Valley is in eastern Oregon. It is away back off of the Snake River. Murphy is on a branch of the Short Line south—practically south of Nampa, a little west. Some of the livestock are shipped to Portland and some of them are shipped east. (493) Some go to Los Angeles. I don't know whether any of those cattle go to Frisco or not. I wouldn't say. I suppose at times they do. But that one particular place there is a very bad drive. It is up over a high range of mountains, and you have to take and drive the beef up over a steep mountain and then down again and drive them down a hundred—well, it is between 80 and a hun-
251 dred miles. That particular drive is occasioned by the fact that there isn't a more direct outlet to the west through the State of Oregon. Those cattle should be loaded at Riverside. It is quite a bit closer. I am unable to give you just the mileage, but that is a flat country to drive over, the Jordan Valley. If they were loaded at Riverside, they would logically, if the cross-State line were built, move west either to Portland or to San Francisco.

I wouldn't say as to what extent the production of hogs has been discouraged or prevented by reason of inaccessibility of sufficient markets, but our farmers and hog raisers in our country are very careful, on account of only having the one market—that is, we call one market; we say Portland; of course, there's times when we send hogs to San Francisco or Los Angeles, but it has to be quite a bit better market down there to enable us to take the long (494) way around and compete with the other markets. I would say with the increase of irrigable land, with the opening of the San Francisco market, that it would be safer to say that 50 per cent more hogs would be raised in our country, and I believe a hundred, but it

would be safe in saying 50. There are many times 482 cars of hogs shipped to California points from Iowa, Nebraska, and other points in the Middle West, Colorado, and those States. I was a witness in the previous case involving this same line. I don't remember how the question was put to me that this line was absolutely a necessity, and that the people in our particular locality could not exist and raise cattle or hogs or farm products without different marketing facilities and a more satisfactory outlet to California markets that we have at the present time, but this is the meaning that
252 I had: In order to develop that country as it naturally should be developed, with the irrigable land that we now have, and the irrigable land that is coming in, it will be absolutely necessary for additional market facilities (495) for that country to develop as it should. My testimony at that time has been verified by my experience the last three or four years. Our annual turnover of sheep in Idaho and eastern Oregon is estimated around 50 per cent, and I would say that of cattle 40 per cent. As to hogs I wouldn't want to say, because I am not a handler of hogs. I do buy them, but I am not a real hog man. I wouldn't want to give an estimate on that because it isn't accurate.

253 Cross-examination:

I said we operate five ranches incidental to our stock assembling and shipping business; that is the way we term it. I have operated—not this particular five ranches, because I buy and sell ranches, too, sometimes, but for the last (496) ten years I have operated from three to five ranches every year, had that many on hand.

It is not the purpose of that operation to raise feed for our feeding operations at Caldwell. We do feed some of that feed, however, but we keep the most of that feed to stock on our ranches for the benefit of fertilizer for the ranches, and we feed some of that feed at the stockyards. The large number of our pens and the extensive facilities that we have are provided for the purpose of feeding both transient stock and stuff we handle ourselves. We buy in a considerable volume of traffic both cattle and sheep and feed it, condition it, and ship it to the market. That is our big business. And the cattle we ship west pretty largely, and the sheep we ship east. The sheep business enjoyed exceptional prosperity in (497) southern Idaho because of the development there of a type of lamb for market purposes that perhaps excels any other part of the country. Feed conditions are due to a lot of that. Whatever the conditions may be that brought it about, that is the fact, that the prosperity of the sheep men in southern Idaho has been accomplished by the production of an early spring lamb for the Chicago, Omaha, Kansas City, and eastern markets, and some western markets. This is true to such an extent that it has received even national recognition and comment.

Some sheep are shipped to Los Angeles, too, but I have never shipped any there. I ship some cattle to Los Angeles.

254 Q. Now, it is further to Los Angeles than it is to San Francisco, isn't it?

A. From our point?

Q. Yes.

A. The way we go now?

Q. Either way, except to Portland?

A. No; not either way. (498.)

Q. What?

A. Oh, you mean the other way, that we have now?

Q. Yes.

A. Yes, sir; I think it is.

Q. And yet with that condition you ship over six times as many cattle to Los Angeles in a year as you ship to San Francisco Bay points, don't you?

A. We have, I think, possibly, up until this year—I have no record of the shipments of this year, but I will give you an explanation of that, if you will allow me to. The condition we have in San Francisco has been this: Up until last spring we weighed our stock off of the cars in San Francisco; in Los Angeles we weighed them on a fill, the same as we do on other markets. And there is no stockman that like to sell off the cars, weighed off the cars, no matter what the price is, unless it is exorbitant; that is one reason why you will find from now on more stock going to San Francisco. In fact, there already has this year, from our records at home. The method of selling to San Francisco changed. (499.)

As a rule we ship these sheep in double-deck cars, and as a rule they arrive in good condition. In general I don't think we have any complaint against the service of the Oregon-Washington

255 Railroad & Navigation Company of the Oregon Short Line or the Union Pacific Railroad Company, as far as livestock shipment is concerned.

Q. As a matter of fact is there any other road in the West that specializes and gives the expedited service that the Union Pacific system does in the movement of livestock?

A. That gives any better service?

Q. Yes.

A. No; I wouldn't say that they did.

Q. Now, you think if you had a cross-State line that you could get down into that San Francisco market from Caldwell better than you can now?

A. Yes, sir.

Q. With your livestock?

A. Yes. (500.)

Q. It would depend on what kind a line it was, wouldn't it?

A. Yes, sir.

If it were a branch line type of railroad, with thin traffic and necessarily slow movement, I would prefer to ship over a somewhat

longer route, if the facilities and road were of the quality of the main line of the Oregon Short Line, but the Union Pacific would never stand for that kind of a road; with the reputation they have got of giving service they would never give us that kind of a road. As to what the condition of the road from Ontario Junction to Burns is as compared with the main line of the Oregon Short Line, there is no comparison at the present time, because the roadbed, in the first place, isn't there, and it is crooked; there are short turns in it, and I suppose possibly that is due to not having more business over that line that justifies a better road. I don't know what else. That appeals to me as ordinary business common sense. This road,
256 as far as its alignment is concerned, is necessarily tied into the Malheur Canyon. (501.) It has got to go up that canyon in order to get out to Crane. Speaking of the curvature, of course, you could straighten out some of the turns. If that character of line were continued across the State and connected at Crescent, a shipment starting at Ontario Junction would be unloaded over here in north Portland before you would be out of the desert with this cross-State line, I think, if you didn't fix the road. (502.)

Q. Now, if we are going to have one of these trunk cross-State lines, we have got to rebuild that line, then, from Burns to Ontario, a distance of 150 miles. Is that right?

A. No; no; you wouldn't have to come from Burns at all.

Q. Well, from Crane, then, wherever——

A. Yes.

Q. All right; 127 miles.

A. Yes.

Q. All right. And then we have got to build across the new road, across the desert to Crescent Lake?

A. Yes, but let me tell you, when you build that new road across there that you are opening up another new territory that is about as big as this 75,000 acres I am telling you about, that is very fertile land, that will be adjacent to your railroad.

Q. Where do you find that very fertile land that is adjacent to the——

A. Well, there's lots of fertile land, even around the Circle Bar, and around those big holdings there in the Burns territory, and clear on out that dry lake country.

Q. You mean to Crescent Lake?

A. I don't know whether it is Crescent Lake or not.

257 Q. Christmas Valley?

A. Yes. (503.) I have ridden every foot of that country, trailed cattle over it. You can trail cattle across that desert at certain times of the year when the water holes are full. We do that in the spring of the year; they do that in the fall of the year, late fall, after the first snows come. I don't know why, then, instead of going clear down to Winnemucca they don't drive over to

Klamath Basin, where there is such nice grounds, because I never had that part of it. I never operated to go that way. I have operated to come this way, that is, to come east.

I have not checked up on the mileage from Caldwell, which is my shipping point, to San Francisco via Wells, Nevada. (504.)

I don't call the railroad of the Oregon Short Line from Minidoka down to Twin Falls, a high-class railroad; at least it isn't high-class service, not going across the Rogerson cut-off. You go from Caldwell to Minidoka to go down to Twin Falls. That is the main line of the Oregon Short Line, but we don't ship that way. I am familiar with it and have operated all around that country. (505.) And then you go down to Twin Falls; if you are headed for Wells, Nevada, that is where you would go. You can go that way. It might be a good railroad. There is a lot of complaint about ever putting any stock over it. I have never shipped over it. I have had shipments that went out of our yards. We specify the routing of our stock shipments, but we do not specify the routing when someone comes in and buys. The bulk of our shipments are bought out of our yards and the buyer routes them. That is true all over that country. (506.) The buyers come in from Portland,
258 Seattle, Tacoma, and buy and route their stuff. And they come in there from Kansas City, Omaha, Chicago, and Denver and compete for that stuff. And they ship it east to Denver, Omaha, Kansas City, and Chicago in large volume. If there is a shrinkage, they sustain it. We don't sustain it on their shipments. I ship quite a few cars. I shipped 1,286 head—that would be about 30 cattle to the car—last year to western markets, Portland and Seattle; and one year I shipped 600 cars of cattle to Denver. (507.) I think that was in 1924. That was an unusually large shipment for me to make myself. We don't ship many sheep or hogs—not over an average of, maybe one hundred cars a year. We sell practically all our stuff to home.

The buyers absolutely do take into consideration this prospective shrinkage that I am talking about in fixing the price they pay for the cattle.

I know about the sale that was made to Kansas City last fall away up in the Bear Valley, 50 miles north of Burns, where they paid one hundred dollars a head just as they ran, destined to Kansas City. That was the Oliver cattle. (508.) They did not figure on the shrinkage when they paid that much for them (509) because they bought them by the pound; he bought them at so much per pound. Mr. Smith bought those cattle from Mr. Vick; that's the Oliver cattle. They were shipped to Payette and fed in transit at Payette and were, I think, billed to Kansas City or Chicago; they later went on to Grand Island and went on the feed at Grand Island.

Q. Well, as a matter of fact, the point I am getting at here is, you ship extensively from your country to Kansas City, Omaha, and Denver, don't you?

A. Lambs and sheep; yes.

259 Q. Well, practically all sheep go there?

A. Yes.

Q. And you ship extensively of cattle, beef cattle, too, don't you?

A. Yes; there's quite a few shipped there.

Q. Well, probably more cattle shipped to the east than there is to the west? (510.)

A. No.

Q. No? Including Denver?

A. No; I wouldn't include Denver. It might be that there's more shipped to the east, including Denver, than there is to the west.

It is a five-day run with cattle or mules or sheep to Denver. I don't know just what the distance is offhand. The run to Omaha is from five to eight days, including feeding. The livestock special does not enable them to make Omaha as fast or faster than they do Denver. I never could. It is about sixty days since I have gone with any to Omaha.

Q. (By Mr. SPENCER.) Well, then, a railroad across central Oregon of the type that is there now into Burns, or the same class as obtains from Minidoka to Wells, Nevada, would not be very helpful to it, would it? (511.)

A. I am not saying that. I said that the general shipments that went over the Wells cut-off isn't beneficial to the shippers; at least they don't consider it so; they would rather take the service that they get on the Short Line around by Salt Lake and back to

260 those points than they would over the cut-off. Now, I don't know whether that is due to your service on that road, or what it is, but that is the way they ship the majority of stuff out of our country.

Mr. ELLIS. You don't understand, Mr. Spencer, that that is the kind of a railroad we are asking for, do you?

Mr. SPENCER. Well, it is certainly the kind that you would have to get. You couldn't—now, you know why they ship around via Ogden, don't you, Mr. Smeed?

A. No; there's several reasons. One of them is, now, a man shipping direct to a packer, for instance, Humphrey & Moffitt's man, had in twenty cars of sheep in June of this year, and they ship them via Salt Lake through our yards to San Francisco. Now, do you think that is cheaper to ship them across here? He shipped them direct to the packer. He shipped them over that route because there wasn't any other route. (512.) He didn't ship via Salt Lake to San Francisco, via that route. He would go to Ogden. Maybe I should have said that route, via Ogden. There is a good market at times at Ogden. That is not the reason why they go via Ogden instead of going via the Wells cut-off where they are going to a packer. A packer don't sell his stuff on the market. The buyers and speculators do but not the packers. This was a packer buyer. I don't know how much of this stuff that we sell goes to the

packers. It is my thought that this packer buyer, even on a single shipment, would absolutely use the best route. The volume of the shipment would not (513) influence that; it will be judged by the service and the shrink and the cost of shipment. With me that would be true whether he has one car or many cars. I don't know how it would be with everybody.

261 Q. (By Mr. SPENCER.) Now, if this California market is the objective, why do you want to go up to—away up to the north and connect up with the Southern Pacific at Crescent Lake? The Southern Pacific and Great Northern are building up to Silver Lake, aren't they, from Klamath Falls?

A. I am not familiar with what they are doing over there, Mr. Spencer.

Q. Well, they could extend that line right up there from the Silver Lake country, couldn't they?

A. They probably could. I don't know whether they could or not. I am not familiar with the railroads. (514.)

Exam. ROGERS. How many miles would that be, Mr. Spencer?

Mr. SPENCER. Well, it would be somewhat shorter than this cross-State line. I don't know how far it would be; probably be—how far would it be across there——

Mr. ELLIS. It would be just about as far as the line we are proposing.

Mr. SPENCER. It would be about forty or fifty miles shorter.

Exam. ROGERS. Is that an option that you are putting to this witness?

Mr. SPENCER. I am asking if San Francisco is the objective why that wouldn't be the proper route and shorter route to San Francisco than one by Crescent Lake?

A. I wouldn't say, because I am not familiar with it.

I didn't mention the markets at Seattle or Tacoma. The slaughter of cattle at Seattle is not larger than at Portland. Portland is considered the livestock market of the Pacific Northwest. (515.)

262 Everything practically comes to Portland now. There used to be quite a bit of stuff diverted at The Dalles and go over to Tacoma, but now practically everything comes in here. Some do go to Carstens, but he buys quite a lot of stuff out of Portland; and the same with Mr. Frye. Frye and Carstens ship up there to the Seattle market. I think according to population the Seattle market as a consuming market should be as great or greater than Portland, although I am not familiar with it. I did not intend to say that our Portland market is limited to fifty cars. Monday is the main livestock day at Portland, where they make the big sales. They ordinarily have in there from fifty to eighty-five cars, and whenever you get up to eighty-five you have got too many. (516.)

As a rule the Portland market can handle from fifty to sixty cars a day, and more than eighty cars would glut the Portland market. It might be that one week you would get away with eighty

cars, but you come back the next week with eighty cars it will invariably take it off; the records show it.

Q. (By Mr. SPENCER.) Well, they handle in the Portland market sixty-five hundred to seventy-two hundred cars a year, don't they?

A. What have you got there? The stockyards' record, or the packers' record?

Q. The stockyards' record.

A. Well, a lot of that stuff went to Tacoma and Seattle.

Q. I know; but that is what I am talking about.

A. I know; but some of that stuff is billed through and stops here at Portland. I am talking about what the Portland market can handle.

Q. I am talking about the north Portland stockyards—what they can handle over there, and that is unloaded into their pen.

263 A. I wouldn't say that, because that isn't the market, because some of that stuff is billed through; some of it, a lot of it (517) probably did go through to California.

Q. There isn't any of it billed through?

A. We bill everything through to Seattle, the same rate.

Q. I was asking you how many cars of livestock came in there to north Portland yard for Monday business, and you said as a maximum about eighty to eighty-five cars, and I am asking you if it isn't more than double that.

A. No. So you won't be misunderstanding me there: I get most of my dope from the commission men out there; the Sevier commission men would bear a pretty good reputation, and when they wired me that eighty to eighty-five cars is too many cars on that market I believe them.

Q. That is the practice, isn't it, as a matter of fact, before you ship in you get in touch with your commission man over there to find how much the market will stand, and you arrange amongst yourselves to ship accordingly?

A. Largely, that is true.

Q. It has been the practice for several years?

A. But we can't always follow that practice.

Q. But you attempt to?

A. We try to.

From Jordan Valley to the shipping point at Murphy (518) is approximately seventy-five to eighty miles. Murphy is on the Murphy branch. The Homedale branch is not the nearest shipping point. It is a little bit further. It isn't quite as steep a trail, but it is drier. There is no water much on the Homedale branch.

264 All of that business comes into the main line at Nyssa. Caldwell is east of Nyssa and west of Nampa, nine miles west of Nampa.

Q. Now, you say fifty per cent of the hogs would go to California if you could be just encouraged to raise hogs out there in southwestern Idaho?

A. I would say under this new irrigable land going in that I think there would possibly be an increase of fifty per cent. You understand that I am not hiding the Short Line; I am (519) simply trying to build up and open up our country over there and help the Short Line to live, make money for it.

As a matter of fact, hogs are shipped right into this north Portland market right now from Nebraska. And they ship in to Los Angeles from back there. They also ship into San Francisco Bay cities. Whenever the hogs get a little high for the packers down there, they just load up eight or ten cars down in the eastern markets, in Colorado, and come out here and break this market. Now, this year in June they broke our hog market at Portland a dollar and a half in one week. Now, when you have hogs on feed, such as in our country there, there is a certain time to market those hogs at about a certain weight, if these fellows don't cut you, or if they are heavier than that it will cut you in the prices.

The building of the cross-State line would (520) not dissuade these packers from counting that attitude. I don't know whether the Utah packers ship hogs from Nebraska and Colorado. They probably do. At times Oregon and Washington, California, Utah, all of these Western States, draw on the east for hogs from the Mexican line clear up to the British Columbia line. (521.)

265 I did not testify that there is a shrink of $68.00 per car. I said a shrink of one per cent. There is a loss of $68.00 per car somewhere. That is the feed bill and shrink which occurs from any point, whenever you add 400 miles onto the distance. You load the cattle at Caldwell and ship to Portland—you will get anywhere from 15 to 60 pounds per head shrink; it is according to what kind of a bill you get in Portland, what kind of a run you get on the road; but if you had to ship those cattle on two more feeds, that would be approximately six to eight hundred miles, according to your railroad and the service you got over it, you would still have another additional shrink, but it wouldn't be in accordance with your first shrink. Your (522) first shrink is the greatest. I have based it on three per cent, to be sure, and your feed will be around one and a half, and the next feed will take off one per cent, because the farther you go, you understand, the tireder your stock get, and they don't get rested up, and consequently they lie in the yards instead of eating and drinking and filling up.

Q. All right. Now, from Caldwell, Idaho, to San Francisco by the route that you now use through Ogden, as I understand it, would that be $68.00, the same as to Portland, in shrink and feeding?

A. No; we ain't figuring this to Portland. We are figuring this to San Francisco by the present route.

Q. What is it?

A. We base these figures on the present route to San Francisco. We don't base them on Portland.

Q. How many miles is it by the present route from Caldwell to San Francisco?

266 A. The present route?

Q. Yes.

A. I don't know the number of miles. I base my claims on the number of feeds and the time it takes to make the run.

Q. Well, where does the 400 miles come in, then?

A. This proposed road would cut off 400 miles of distance (523) between Caldwell—our country up there, Boise Valley, and eastern Oregon, off of the route that we now have going by Ogden to San Francisco or coming around by north Portland and down the other way.

Q. How much would it cut off from the Rogerson-Wells route to San Francisco?

A. I don't know.

Q. You have never taken occasion to take that up?

A. It isn't practical; no; it isn't practicable at this time to ship over the Rogerson-Wells cut-off.

Q. In other words, I understand, you figure if you reduce your distance to San Francisco market 400 miles under what it is now you would save $68.00 per car?

A. With the same service that we get over the other roads. As a rule we ship through to the north Portland market from Caldwell without unloading for feed and water. We don't always, though. (524.)

I said that hay in California was worth $22.50 a ton aboard the car. They buy it by the carload, delivered in Los Angeles, anywhere in Los Angeles, or points close for these dairymen, at $22.50, and more. I am in that business. I have to bear the freight charges out of the $22.50.

267 Redirect examination:

In discussing this saving of $68.00 per car, I did not give any consideration at all to the possible saving in freight charges due to shortening of haul. That is based on two additional feeds and shrink. Here is the main issue that I bring out in that particular item there: We will take it on from here to Omaha, for instance, and I load to-day, we will say, at Heppner. Say they tie me up in Heppner Junction for six hours, so I am delayed in that long run one day to the market. I am basing my market on when I load my stuff as to when they should arrive to be sold in Omaha (525) or Kansas City, or vice versa, if we ship it from here to San Francisco, and if I am a day late it may mean a loss of 50 cents a hundred on that stuff. Now, I am not taking that into consideration in these figures at all. I am simply taking the additional feed bills, the additional shrinkage that you have in the longer distances; that is all that is taken in in here.

Q. And to really determine how much more valuable your live-stock would be with the cross-State line you would have to add to

this $68.00 figure such saving as might result in freight charges and such additional return as you might receive due to reaching your market quicker?

A. Well, now, I wouldn't be positive about that. I got this partially from the Oregon Short Line, so that—I depended on our bookkeeper with the information that he gathered to figure that out, but if I have this correctly that is based o nthe feed bill at the additional shrink.

Q. I am quite sure you are right. I don't think anyone has ever——

A. I don't want to be unfair there. The feed on a car of
268 cattle is around $8.00 each feed point, so two feeding points would be in the neighborhood of $16.00. The one per cent shrink on—the minimum on a carload of cattle is 30,000 pounds. Now, if you were receiving on the market, we will say, at the present time 12 cents, that is, taking the best price of steers (526), 12 cents, you would have a losing of one per cent on a 30,000-pound car; you can easily verify my figures there.

The difference in freight rate on a car of cattle to Portland as against San Francisco—it is $233.00 to San Francisco and it is $119.00 to Portland, I believe, or $119.50 less the sanding charge. I think that is correct. That is from Caldwell.

With reference to my testimony about breaking the market on hogs, Mr. Spencer asked me if the cross-State line would change the attitude of the packers. As to what effect the cross-State line would have on our ability to raise hogs and protect ourselves against that condition of having the market broken, it is the same condition you would have of wheat. If you had one miller to sell all your wheat to, you would have to depend on him for your market. If you had three millers to sell your wheat to, why, you might get a little variation in price there. Now, it is the same thing on the hog market. If you have only got Portland to come to—Portland and Seattle are never to my knowledge, anyway, over ten or fifteen cents difference, and I think you get that taken up—you get a (527) better bill at Portland than you do at Seattle.

Q. Would it mean this, that in your opinion, while the packers might break one market it would be more difficult to break them all at the same time?

A. They wouldn't break them if the supply wasn't there.
269 Q. Now, has that thing, however, that condition of which you speak, the breaking of the market, discouraged the production of hogs to any extent in your territory?

A. Yes; it has, because there is—I feed a good many hogs myself, and I am very careful about watching to see how many hogs is on feed to this coast market. There's times of the year, however, when we can go to San Francisco or Los Angeles with our hogs, even, and pay the additional expense and feed over coming to Portland with them.

We have some heavy grades to ship our cattle over at the present time, in shipping to Portland. We have a double-header out of Huntington, and if you want to go up over the Wells cut-off you have got the King Hill to pull up the other way. Assuming that the Short Line did not improve its Crane branch very much, I think there would be a big difference in the character of haul. There are a lot of short turns in that road. I think there would be quite a difference. After you get to Crane the line is up on the plateau (528) out of the canyon. And from there west the territory traversed is generally level and the character of line would be very desirable for the shipment of livestock as near as I understand the route. I have been across that country but not over what might be the survey. There may be a survey made there that goes some certain way that I don't know about. When we ship livestock to San Francisco at the present time we have some pretty long, steep grades to ship over, too. I wouldn't say that the grades are any worse than they would be over some other road. I don't know. Referring to the route from Idaho to Portland and comparing it with the route from Idaho to
270 San Francisco, I don't think (529) outside of the distance there would be so very much difference.

I am not a railroad engineer, but I would think that the road from Ontario to Burns could be straightened out sufficiently to run heavy trains over it. The Oregon Short Line is double-tracking some parts of its main line through Idaho. I guess it is the intention to double-track more of it.

Recross-examination:

Q. (By Mr. DEY.) Mr. Smeed, if your extra expense is $68.00 on an additional haul of 400 miles, what is the extra expense on an additional haul of 120 miles? (531.)

A. Well, now, that would depend. That would depend on what end it was on. If you were going into market and you could make it with the 120 miles—for instance, you must not keep your stock on the car over 36 hours. Now, you might be able to make that additional 120 miles in that time. But in shipping fat stuff to market we don't like to keep them on over 28 hours to 30 hours, but we do sometimes keep them on practically the full 36 hours. So I would not be able to answer your question there. It would all depend on your conditions, and just how much time you had in your movement to get that stuff there.

Q. Well, you could say, though as a general proposition, that an additional haul of 120 miles would involve a great deal less expense than an additional haul of 400 miles?

A. Oh, I would think so.

Comr. MCMANAMY. Is it customary for stock shippers when they make a shipment to sign the 36-hour release?

A. Yes; if we expect to get anywhere around the limit, I think, we get the best results to sign the 36-hour release when we bill them out.

Comr. McMANAMY. As I understand you, Mr. Smeed, the
271 relative number of stock on ranches and farms and ranges is changing somewhat; that is, a greater per cent of them are raised on small ranches and farms than on the open ranges? (532.)

A. No; I didn't say that. I said there is an increase now on the ranches to what there was four or five years ago, but there has been a decrease on the ranges.

Comr. McMANAMY. That would change the ratio, wouldn't it?

A. The ratio has been so much more on the ranges than there has been on the ranches. That is due to the fact our country is becoming quite a dairy center and consequently there is from 20 to as high as 120 cows on a place on those farms where there didn't use to be.

Comr. McMANAMY. That would result in a greater number of cattle being raised on the farms and ranches in the future?

A. Yes, sir.

Cmr. McMANAMY. You expect a substantial increase from that direction?

A. Yes, sir——

Comr. McMANAMY. In routing stock to San Francisco do you know whether or not the shipper routes them via the Rogerson-Wells cut-off?

A. Well, I know a good many that don't. I would not say that every one didn't, but there is a good many that ship that don't.

Comr. McMANAMY. It is not general to route them that way?

A. No, sir.

Comr. McMANAMY. Well, do you know why?

A. Well, there are two reasons. One reason is that they
272 don't (533) have the train service over the Wells-Rogerson cut-off—I suppose due to the fact that the traffic is not there; I would not say; and another reason is that when you go by Ogden there is a chance, if you are shipping to market and not shipping direct to a packer, that you might strike some eastern buyer there that would give more for them to go east than they would to go to San Francisco, at certain times of the year.

Comr. McMANAMY. Do you know whether or not any complaint has ever been made to the Interstate Commerce Commission concerning the service over the Rogerson-Wells cut-off?

A. I don't know.

Exam. ROGERS. Mr. Smeed, when you ship your own livestock do you specify the routing?

A. Yes, sir; that is, to eastern points oftentimes the railroad routes them, that is, our agent there. Of course, we have that privilege and we can route them any way we want to, but they naturally—if you didn't route them, for instance, when you billed them out they would give you the best possible routing over their lines.

Exam. ROGERS. Well, what is your practice, to route them yourself or to leave the routing to the agent?

A. Well, my practice has been to leave it generally to the agent, because we generally ship to Denver, Omaha, sometimes St. Joe. But lots of shippers do designate the routing, I (534) think, due to the fact that oftentimes those eastern lines have men out here after the business and they try to get them to route them over their lines.

Comr. MCMANAMY. Well, located as you are, on the Union Pacific system, shipping to Ogden, Denver, Omaha, or St. Joe,
273 there would not be much chance to specify routing?

A. Well, there is a chance.

Comr. MCMANAMY. It all goes over the same line, doesn't it?

A. Practically so. I think after they get down in Wyoming, around Laramie, I think there is a diversion there. It just depends on where you want to go.

274 H. J. OTTENHEIMER was thereupon produced as a witness on behalf of the complainants, and having been duly sworn testified as follows:

Direct examination:

I reside in Portland. (535.) I am in the wholesale woolen and trimming business. I have been a resident of Portland about twenty-five years. I am at the present time a director of the Portland Chamber of Commerce. The Portland Chamber of Commerce has intervened in this case in support of the request for a cross-State line. In appearing at this hearing I am appearing on behalf of the Portland Chamber of Commerce as an intervener. At the request of the public service commission, the Portland Chamber of Commerce, through its statisticians, have compiled certain statistics; for instance, a table of statistics of the population of Malheur, Harney, Grant, Lake, Crook, Klamath, and Deschutes Counties; second, area of the above counties in square miles; third, number of farms in each of above counties and the aggregate area in acres now being farmed, also average acreage per farm in each county; fourth, production by counties for past four or five years in principal commodities; fifth, possibility of increased production (536) by commodities, particularly as stimulated by the proposed railroad; sixth, location and amount of subterranean supplies of water in various counties that can be made available for domestic, livestock, and other purposes, by drilling, etc.; seventh, estimates of raw and unused lands in counties that will be opened up by the proposed railroad; eighth, possibilities of increased population per county and number of farms that might be expected by building of railroad. I have also supplied maps of the State of Oregon showing the existing lines of railroads with the principal cities and towns of the main and branch
275 lines of the railroad, likewise maps of Washington with the same data. These are the maps to be submitted [producing maps]. I think the data is on the face of them typewritten—benefits

which, it is believed, will accrue not only to the city of Portland but to the State as a whole from the construction of the proposed line westward from Crane. This information was compiled under my general direction. (537.) I have it in the form of a report.

(The statement referred to was received in evidence, marked "Exhibit No. 15, Witness Ottenheimer.")

With reference to the first table on page 3 of Exhibit No. 15, data showing the area in square miles, we show the area in square miles of the territory tributary to this railroad to be about 43,000 square miles, with a population, according to the United States census of 1920, of approximately 50,000 people, divided as per that sheet. Page 3 includes only counties east of the Cascade Range that would be considered tributary to and benefited by the cross-State line. (538.) I have included no counties not immediately adjacent to the line that might receive indirect benefits. This does not include anything in western Oregon, or anything not absolutely adjacent to and tributary to the proposed line. The development of farming in this area is practically at a standstill. The records show that from 1920 to 1925 there has been practically no increase in the aggregate.

The information shown on pages 4, 5, and 6 of Exhibit 15 was gathered by our statistician from Government records and State records and other records that were available; likewise through using the figures of the Oregon Agricultural College, wher-
276 ever available. There is nothing in connection with the crop and livestock data shown on pages 4, 5, and 6 that I would like to explain or elaborate on in any way. I think in point of statistics they are sufficient. (539.) The figures on page 7 were obtained through Mr. Teutsch, whose services were used to that extent. Page 8 is an index of the succeeding charts. Page 9 is the result of an investigation, I understand, that was made by Mr. Waring, of the United States Geological Survey, showing the available water supply in that section. Investigation shows that there is water beneath the surface in that territory at various points in Harney Basin, Alvord Basin, Catlow Basin. Likewise farmers have been interviewed in the various localities there. As to recent information received from ranchers, at Wagontire L. J. Adington has a six by eight foot dug well, 15 feet deep. The water rises to within three feet of the top. (540.) Wagontire is west of Crane, almost probably midway between Crane and Crescent in central Oregon. I think that is out on a portion of the territory referred to by Mr. Spencer as a high desert. The next well is also at Wagontire. I have not made any investigation of this personally. This was done under my direction at the chamber. (541.) As to page 16 we went to considerable trouble to check up the various distances at the points shown, with the result that we found quite a number of variations; that is to say, savings between the proposed route and the present means of communication. As to the basis for the estimates used on page 16, we had a statistician check up very thoroughly, in conjunction with the Oregon

Agricultural College, in arriving at these various amounts,
277 computation. The same would apply to page 17. (543.) I have already explained page 16. They took the map and took the approximate distance of 50 miles on each side of the proposed line and estimated (544) the area.

I think a rail line constructed through the central Oregon territory would undoubtedly render service to an area 50 miles on either side of the line. I have made calculations to determine how much shorter the distance to Portland from any point in that area would be. On page 17 we checked various distances; from Burns to Portland via the Union Pacific, under the present route, also via the proposed line, showing a saving in distance of 183 miles between Burns and Portland. Burns to Klamath Falls, via rail under the existing line, is 780 miles; under the proposed line 291 miles, making a saving of 489 miles. Burns to Salem, the present route is 640 miles, the proposed route 351, a saving of 289 miles. Burns to Bend by rail under the existing road is 633 miles, via the proposed line 234, making a saving of 399 miles. Those figures all appear in the exhibit.

I think the timber statistics on page 22 are self-evident. (545.) Our statistician got those figures, I think, through the lumbermen's association, and so forth. They have means of checking up that.

In connection with the last page of the exhibit I might say here that Portland is concerned in the matter of this new road because they are apprehensive that unless the Union Pacific does build this road from Crane to a junction with the Southern Pacific at or near
Odell, the tendency of the Southern Pacific will be to build
278 northward from Lakeview. In that event the trade influence will be toward San Francisco. We are interested in seeing the trade of the sphere of influence headed towards Portland. We are interested primarily in the development of Oregon rather than in California. We feel that we have in what is known as central Oregon an empire of probably 30,000 square miles that are not adequately served with a railroad, and that it is essential to the development of Oregon that a road be built across the State. As to what extent we are able to maintain trade relations at the present time with central Oregon—with Burns, Crane, and that area, as the table of distances indicates, it is quite a long route and we are in competition with points like Boise, Idaho (546), and other points, that, with the building of this cut-off, we feel would bring us closer to that territory. We believe it would develop along the route of what they term the high desert; that there will be a development there, just as there has been in other places that at times looked like barren deserts, and so forth, but with the advent of railroads they have developed and farms have sprung up right and left. We think that development with direct rail facilities to western Oregon would accrue to the advantage of Portland. I would not say we would object to any plan of railroad development

that would make central and southwestern Oregon a trade territory which would more logically go to San Francisco Bay points, but naturally we would prefer to see that big territory tributary to Portland.

I have lived in Oregon the greater portion of my active business life. I am familiar with the State of Washington. In a general way I know what the transportation service is that
279 serves (547) the State of Washington. Coming into the State from the East they have the transcontinental lines of the Chicago, Milwaukee & St. Paul, the Great Northern, and Northern Pacific; and the S. P. & S. Railroad from Spokane. I think I am familiar with the rate of development in the Northwest. Washington is developing by far more rapidly than Oregon. I am inclined to believe that Oregon is the richest in potential wealth, mineral, timber, and so forth. I think the activities in the early days of the railroads in Washington were instrumental in bringing it to the front. I am afraid if Oregon does not secure more adequate transportation service it will continue to lag behind the development of other Western States. (548.) The lack of railroad service is what we are trying to overcome in this hearing.

(The two maps were thereupon attached to and made a part of Exhibit No. 15, witness Ottenheimer.)

I think the date of the map is 1927. (549.) I am not sure. The map I now have is of the State of Washington. It shows the lines of the railroads in Washington, and we have checked the principal cities in blue and the towns along the main and branch lines, and particularly at the junctions.

We have outlined in blue on the map of Oregon the approximate route of the proposed cross State line; also of the Great Northern line from Bend to Klamath Falls which has since been built. (550.) The blue check marks on the map are the principal cities. The comparison I want to draw from the two maps is the discrepancy in the development of the cities, the State of Washington showing a great number of cities where they are rather scant in Oregon.

280 Cross-examination:

I have been through parts of this central Oregon country myself, through from Bend to Prineville, as far as Millican, Christmas Lake, Paisley, Lakeview. I have never made a trip from Bend to Burns. It has been 10 years since I was down to Paisley and Lakeview; to be exact, I will say 1915. I went by automobile through that country to California. There were some homesteaders and some abandoned homesteads. (551.)

Since 1915 there have been several hundred miles of railroad constructed into central Oregon and through the western part of central Oregon between Bend and Klamath Falls.

I do give it as my opinion that a line in a country like that will serve a territory for a distance of 50 miles.

Q. Now the Natron cut-off has been completed for about two years, and the Bend-Klamath Falls line of the Great Northern has been open for several months. Do you know how far it is from Fort Rock and this great Christmas Lake Valley to the Natron cut-off, or to the Great Northern?

A. I know approximately; it is further than 20 miles to the Great Northern line. I have not got the map with the sections on it. Exhibit 15, the Rand-McNally map, shows the approximate location of the Great Northern line down from Bend. (552.) That line was not put on the map by an engineer. I have just drawn a straight line from Bend down to Chemult as showing the approximate location of the line.

In reaching that line, going west from Ft. Rock, you cross about five or six sections or townships.

281 Q. Diagonally we will go across here and connect with the Great Northern on the cross-State line route, and how far is it?

A. In an air line about twenty-five miles, I should say.

Q. All right; twenty-five miles. Now according to your theory, then, Fort Rock is served by two railroads now. Is that right?

A. Yes. But that would depend on the topography of the country there, whether it is accessible straight across in the direction you have indicated. (553.)

Q. You can drive across there—isn't that true—if the State would give it some roads?

A. No; there are no roads across that way. When I say tributary, I refer to the fact that there are roads as a rule along the line of this railroad, or into valleys that are accessible.

Q. Isn't there a road that goes right down alongside of the Great Northern survey, the Great Northern construction, and one that branches off over to Fort Rock? Fort Rock is the only place where you do reach the highway, isn't it?

A. That is the road coming in from Lapine?

Q. Yes; that is right. And Lapine is on the fine new State highway that has been built from Bend to Klamath Falls, to a great extent. Isn't that true?

A. Yes, sir.

Q. The Dalles-California Highway?

A. Yes.

Q. And it can go there and hook up with that highway and take the Southern Pacific or the Great Northern, just as it likes?

A. By driving to that point.

Q. By driving, say, twenty miles, or twenty-five miles. Isn't that right?

282 A. That is approximately right.

Q. Yes. Now you were talking about the subterranean find that the geologists made in 1909 for water under Christmas Lake

(554) Valley and Fort Rock. Is that the location you had reference to?

A. Well, in those various basins. There was Harney Basin——

Q. Well, we are talking about Fort Rock now. What is the condition there at present? I mean, there is no water there, unless you go down for it by drilling wells. Isn't that right?

A. You have to drill for water there.

Q. Yes. And you are suggesting that as a district to support a railroad. Now at Summer Lake you don't have to drill for water, do you?

A. I am not particularly conversant with that. I know I passed at Summer Lake and saw some very prosperous farms in that district. Likewise I know that at Fort Rock as many as ten or fifteen years ago, when I was in the mail-order business, we had a great many customers that went up into the Fort Rock country, friends from Salem that went up into that Fort Rock country and farmed a great many years, and they left, gave it up because of the lack of transportation, said there was no railroad facility. (555.)

I know there are irrigation districts upon which the State has expended large sums of money at Silver Lake, Summer Lake, Warm Springs, and Ochoco. As to whether they are in such distress
283 that they have been unable to pay their current interest and the State has advanced it to them to the extent of approximately four million dollars—I am not ready to concede that irrigation is not a success in the State of Oregon. I am not ready to concede for a moment that this State can not raise as fine crops as the State of (556) Washington or any other place. It is probably due to management or something of that kind. I am not competent to state anything as to whether that is the condition with respect to those projects, that their bonds are now practically valueless in the hands of good-faith holders who have expended their money for them, except that it has been a matter of public discussion with headlines in the papers, of concern to all the people, of the chamber of commerce, and of the State and legislature, so that in the last session of the legislature a commission was appointed to report on it and suggest means whereby it might be relieved.

Mr. DUNCAN. And may I suggest, Mr. Spencer, that is one of the purposes of this hearing, to relieve that condition?

Mr. SPENCER. Yes; I have no doubt.

Q. And yet, with that condition, you are suggesting seriously, as a business man, another project that requires the use of the (557) drill and the well in order to put additional lands on the market?

A. I am advocating the building of a railroad. I have gone through the same thing—even in California I remember many, many years ago the railroads took the same stand. They would not build. The merchants built the road. Afterwards it was taken over by Spreckels, and the railroads acquired that, and that is now in the

San Joaquin Valley, one of the most prosperous in California to-day.

284 Q. And one of the richest valleys perhaps in the world?

A. Yes.

Q. Great depth of soil?

A. And they had just as hard a time getting the railroads in the early days in California as we have in Oregon.

Q. But they had deep silk soil, whereas in the Christmas Lake Valley you are talking about it is hardpan, is it not, and frost?

A. Probably.

I say this road will serve Deschutes County. That county is now served by the O.-W. R. & N., the S. P. & S., and the Great Northern Railroads. (558.) The eastern part of this county is tributary to the cross-State line. I could not say whether that part of it consists of pumice soil supporting a little jack pine and that that is about all.

Q. There is not any town down there that would go to this cross-State line when they can go to Bend, is there?

A. They might possibly. The building of a road might create new towns on the line of that road that would better serve those people than driving to Bend.

Q. You think there are any town sites very attractive over there?

A. They would be if the railroad would make the proper development, judging by some of the country I have seen in the past where there were no towns that when the railroads served them sprung up.

Q. In any event, there are three railroads now in there, and four if you count the Southern Pacific, are there not?

A. That serve the town of Bend?

285 Q. Deschutes County.

A. In one part—the Southern Pacific does not serve Deschutes County. (559.)

Q. Well, it is within fifty miles of it, isn't it?

A. Yes; on that point. Yes.

As to how Klamath County is served by the cross-State line—the proposed road goes through the northern part of Klamath County. The central and southern part of that county will not be served except by the fact that Klamath County would utilize that road. It is 75 to 100 miles from Klamath Falls to the junction of the proposed road.

Crook County is immediately north of the cross-State line. There is some of the population of that county that could reach this line (560)—the population at Fife, Burns, Suplee, and Paulina. That is along the drainage of the Crooked River west of Prineville. I have been through part of that country beyond Prineville a short ways. I have never attempted to go from down on the desert up into that drainage of the Crooked River, nor up on that Blue Mountain Range.

Now whether Lake County has got anything to contribute to the cross-State line, with the development of those soda beds at Alkali

Lake and in that neighborhood, there is a big potential freight there. This is mentioned in the reports submitted to the chamber of commerce (Exhibit 15) (561) under the heading "Raw materials supplies which will be made available by the construction of the proposed railway line from Crane."

This Alkali Lake, containing an estimated three million tons of soda, lies approximately 20 miles south of the line. The mar-
286 ket for that three million tons of soda would be with the chemical company in San Francisco. I could not say how many train loads a year that would make, but with the development of the railroad those things always take care of themselves. I am pretty sure that if the question is met there will be a demand. There is a great demand for soda.

Q. There, too, the proper way to go out with that, then, if it is going down to San Francisco, is to extend the Lakeview branch of the Southern Pacific, isn't it?

A. Not necessarily. As I said to you before, the chamber of commerce and the city of Portland would prefer to see that (562) connection made so it would come and meet the Southern Pacific at or near Odell Lake.

A market in Portland might be developed for it. We didn't contemplate hauling that up to Portland; we were going to haul that to Odell Lake and then down to San Francisco unless in the meantime chemical works were started at Portland, which is not at all improbable.

Q. What is going to become of the production in California at Searles Lake that is now supplying excessively the California market?

A. Well, I can't agree with you, Mr. Spencer, as I sat here and listened to your line of reasoning, applying, that there should not be any competition at all. Your theory apparently, as I sat here listening, is if a country has one service why have any more? If we have a gas station at a corner here serving you, why have another? In this State we want the service. Besides, there is the competition produced by the growth of cities, and Portland is striving and reaching out for factories. We have the great export trade developing in China, and with the opening up of this country, opening up
287 the big deposits, like soda, there would be development of a great chemical work in Portland just as your Searles Lake in California created them there in San Francisco, and these (563) things can not be developed without the aid of railroads.

Q. And you want the railroad to extend its field of activity and go into another one and see if it does not develop this as you expect it will. Is that right?

A. I want to see the railroads develop the State of Oregon, especially with this cross-State line, opening up this section.

Q. Now, I notice you treat Grant County, too, as being tributary to this line. How is Grant County served now?

A. Well, Grant County is a very large county.

Q. It is in the Blue Mountains there and served by a railroad that extends from Baker down through to Canyon City—to Prairie City, rather, doesn't it?

A. The railroad does not go to Canyon City.

Q. No. What is going to become of the business that sustains that road?

A. Now, do I understand, Mr. Spencer, you claim Prairie City and Canyon City are now on the line of the railroad?

Q. No; I claim Prairie City is on the line of the Sumpter Valley Railroad.

Mr. DUNCAN. A narrow-gauge railroad.

The WITNESS. On the narrow gauge.

Mr. SPENCER. Sure.

Q. (By Mr. SPENCER.) I am wondering how you figure that this (564) Grant County country is going to sustain this cross-State line, contribute in a material way to its support?

A. The trade that would develop tending southwards to Burns, as far as Crane.

288 I mention Malheur; Malheur County is on the main line of the Oregon Short Line and on the existing Burns branch. It is between Harney and the Idaho line.

Q. And you say it carries on its trade perhaps largely with the interior cities, such as southern Idaho cities and Boise and Salt Lake and Ogden. Is that true?

A. Portland. The city of Portland has quite some trade interests in there and do considerable business in competition with those places you mention.

Q. It does. How long has it enjoyed that business?

A. Oh, since the very early days.

On pages 17 and 18 of my exhibit are shown certain mileages (565), and the distance from Bend to Odell is placed at 45 miles. I do not know where that is taken from. In going from Burns to Bend by way of this new proposed route you would use the Great Northern from Bend south. And traffic moving across the high desert over to the Great Northern would necessarily have to be transferred to the Gerat Northern where the cross-State line crosses the Great Northern. I do not know the length of the Great Northern mileage from Bend down to Chemult, where it connects with the Natron cut-off.

Q. Well, it is about 60 or 65 miles, and your proposed cross-State line crosses the Great Northern about 10 miles north of Chemult, so that your figure there, I wanted to show, would be at least 55 miles instead of 45, and, of course, whoever prepared this is not here for cross-examination, but I wanted to show the inaccuracy of at least some of these figures here on some of these commodities. (566.)

289 A. Mr. Dey, doesn't it say under Bend to Odell "Est."—estimated?

Q. Yes.

A. Yes; because we didn't have the accurate figures of that.

The second group of figures on page 17 of my exhibit are also estimated. That is not true of all the figures through there, but only when the exhibit says they are estimated. (567.) The exhibit shows Odell Lake to Portland 215 miles. The connecting point here is at Crescent Lake, some distance south of Odell; and as to whether the correct distance there would be about 232 miles instead of 215. I know nothing of the accuracy of these figures of my own knowledge; I asked that they be compiled.

I said there were some thirty thousand miles in Oregon that were not now adequately served by railroad and I was referring to that general country known as what we have called east and central Oregon. The area that is included within the thirty thousand miles may be defined as all that territory south of the Blue Mountains, between the Cascade Mountain Range on the west and the Idaho State line on the east, and Nevada on the south. That will take in portions of Deschutes, Klamath, Crook, Lake, Grant, Harney (568), Malheur, and Wheeler Counties.

On page 1 of my exhibit it is stated that the data "contained in this report is for the most part in conformity with the memorandum of data required by the public service commission," but the word "required" should be "requested."

The Portland Chamber of Commerce entered into this proceeding through the act of its board of directors. The proposition of the Portland Chamber of Commerce intervening in this proceeding was initiated by the chamber's board of directors. I could
290 not say whether the board of directors took this matter up with the public service commission, or whether the public service commission took the matter up with the board. I wasn't on the board at that time. (569.)

Redirect examination:

I spoke of Portland having had certain trade relations with Harney and Grant Counties and other interior points over a number of years. It is a fact that those trade relationships originated before the rail construction and at the time when all of the freight was hauled in and out of that country by wagons. It dates back prior to 50 years ago.

It is my thought that owing to the (570) existing circuitous routes we do not have the trade advantages in central Oregon and Grant County and Harney County that we should have. In referring to the fact that many of these counties would receive benefit from this line, I did not mean to suggest that the cross-State line would provide their only rail facilities, but that it would add materially to their means of outlet.

Q. Mr. Spencer has endeavored to get you to approve a haul from a point on the Great Northern line between Bend and Klamath Falls across into the Fort Rock section, and suggested that the distance was somewhat shorter, around twenty miles, I believe, he stated. Do you know whether or not there is a physical barrier which prevents the Fort Rock area from getting easy access to that line?

A. My recollection is that it is a mountainous, hilly country there, that is impassable as far as a road is concerned from Fort Rock over towards that road.

Mr. ELLIS. The Walker Mountain Range separates the Fort Rock Valley from the railroad that Mr. Spencer referred to. (571.)

291 Recross-examination:

The present road to Lapine does not go right over the same hill that I said is impassable; I think it goes considerably north of that.

I have a State highway map that I am willing to put in evidence. This is a road map issued by the Portland Chamber of Commerce State highway department, 1928. Now the main road through Fort Rock extends from Lapine down to Lakeview. That is the way you would go if you were going down to Lakeview; you would leave Bend, go over to Lapine, then over to Fort Rock, then down to Lakeview. There is shown on the map another road that swings from this road between Lapine and Fort Rock over to Crescent, but I am not familiar with that road. (572.) I think it swings from mile post 38. I think that is 38 miles south of Bend.

(Thereupon said map was offered and received in evidence, marked "Exhibit No. 15, Witness Ottenheimer.")

In listing the areas in the State of Oregon not adequately served with railroad facilities, I did not mean to be understood that that was the only area in the State that was not adequately served, but just one portion.

Now about the area of the State lying between Bend and Albany by way of the Santiam and the Hogg Pass, I do not think that is adequately served with transportation at the present time. (573.) And there is a vast potential tonnage in that country, consisting of ripe timber, ready for market; and it needs additional railroad transportation for the purpose of moving that timber to market.

292 WILLIAM L. TEUTSCH was thereupon recalled, and having been previously sworn further testified as follows:

Cross-examination:

My present connection with the Oregon Agricultural College or Oregon State College is assistant county agent leader. I have been in that position for two years (574) but have been with the extension service a little over seven years. During that seven years I have resided at Lakeview and at Corvallis. Prior to that connection I was a farm boy in eastern Oregon in Malheur County. I am 31 years old. From Malheur County I went to Lakeview. During the in-

tervening years I spent some time in Umatilla County on wheat ranches, and then to the Oregon Agricultural College, then to the war, and later came back and graduated from the agricultural college, and from there I went to Lake County as county agricultural agent.

I have never been employed by a railroad company to estimate railroad tonnage or to locate for possible railroad development, but I have estimated tonnage while I was county agent of Lake County, and testified, presenting that data in a hearing (575) in 1923, and I appeared here a few years ago in the prior cross-State case.

Q. But the point I am attempting to ascertain is whether you have ever had any experience to determine how far you can go north, east, south, and west and bring tonnage to a railroad line.

A. Why, I have certainly observed the distances that we have had to move tonnage in order to get them to certain railroad lines in the State of Oregon, both as a farmer and as a professional man engaged in agricultural work. And I have noticed that that distance has been from a few miles up to 150 or more miles.

293 As to whether I have ever determined how far certain commodities will ship, for instance, how far hay will stand shipment as far as the rate is concerned, that would depend, I should think, very largely upon the rate and upon the cost of the production of hay, that is, the cost of production and the cost of transportation. (576.) The load per car is about 12 tons; that is the average loading on the O.-W. R. & N. And you have got to have a rate that is rather low to move it any considerable distance.

The estimate shown on page 4 of my exhibit (Exhibit No. 1) from Malheur County, present tonnage 23,050 tons, additional potential tonnage within the next few years, 64,357 tons, is all westbound. I would not say that the present tonnage there set forth is all the tonnage that does move westbound now from that county; I do not know whether it is all the tonnage which moves westbound. But in any event I contemplate if this cross-State line is built, that it will take that route instead of the route now obtaining from Ontario to Portland. (577.)

As to whether a railroad is an institution of growth or not, whether it improves with traffic density, it should improve with traffic density. We would put a better railroad across the State of Oregon and divert this tonnage to it that now moves from Ontario to Portland via the O.-W. R. & N. and the Oregon Short Line. This tonnage consists of these commodities which I have listed here and that only includes a small percentage of the total tonnage which originates in Malheur County.

Now, sheep—they now largely move east.

Q. And cattle. You say you can move cattle across a branch-line railroad to better advantage than you can if you put it in a livestock special?

A. No. We don't propose to have this a branch-line rail-
294 road, Mr. Spencer, if it is constructed. We propose to handle traffic that originates in western Oregon and traffic westbound that originates in eastern Oregon in (578) sufficient volume to make a railroad out of it. There would be sufficient increase in traffic so that the amount we are taking away from the existing railroads is very small in proportion to the total volume that is moved. It may be true that none of the existing railroads in Oregon make any money; I don't know. I think it is right that they can stand it if they are trimmed up a little bit and divert traffic from them, and could get increased traffic from the development that this construction will bring about.

The hogs [referred to in Exhibit 1] are coming from the irrigated lands of Malheur County. The wheat—that is going to move via the cross-State line instead of via the existing railroads because, as you will note under my Willamette Valley figures, there are several thousand carloads of feed imported into the Willamette Valley for consumption, fed to livestock, (579) annually. There is a need for additional feed supply for livestock and poultry in the Willamette Valley and that volume of tonnage is very large. We propose to supply 50 per cent of this from across the State. This wheat would replace some of this feed tonnage now being used.

Q. What is the fact as to whether or not western Oregon consumes all of the wheat, oats, and barley that it raises now locally?

A. Western Oregon does ship in to various points in proportion——

Q. I am asking you the question whether it consumes what it raises now itself. Doesn't it produce in excess of its own immediate requirements?

295 A. The point is it does do that. On the other hand, it uses a large volume of grain imported. The reason it sells some of this material, moves it in the channels of trade, is that we produce wheat for export in the Willamette Valley; we produce some milling oats and they are shipped out; but if we had a balance between the feeds that are utilized and the grain produced, I believe, we would find that the Willamette Valley produces less than it consumes—that western Oregon produces less than it consumes. Now nobody has such a balance sheet as that.

Q. Who is fixing this balance? Are you fixing it here?

A. What balance?

Q. The balance of the consumption and the production in west-
ern (580) Oregon whereby they are going to continue to ship out grain and fill in what they ship out by production over in Malheur County.

A. No. I am just taking the actual consumption of feeds that we know of in these various counties in western Oregon and replacing that with a little irrigated grain from eastern Oregon. It

is logical that it should be replaced with the irrigated grain. It is only fifty per cent of it at that.

Q. Why go way over to Ontario to get it?

A. Because that is where the surplus is.

Q. That is, of wheat?

A. You will find a surplus of wheat in Ontario. You do now in Malheur County. You do find a surplus of hay there, and you don't find a surplus in Klamath, or you don't find a very large surplus in Deschutes or Crook Counties.

The hay production in Deschutes, Crook, and Klamath Counties is not very large in comparison to other counties in the State. Another point is, there has not been a carry-over of hay, or a
296 surplus of hay in Deschutes or Crook or Klamath Counties (581) for quite a number of years. They have fed it to dairy cattle, lambs, and beef cattle and steers. Crook County produced 40,500 tons of tame hay; Deschutes, 36,750; Klamath, 73,700, as compared to Malheur of 112,200; and we are more than doubling the production by bringing in these new irrigated lands and increase the hay production in Malheur County by 100 per cent—more than that. It is not true that there is not an irrigation district in Oregon, year by year in the last ten years, that has not had carry-over hay. No; that is not true. I have just been through Malheur and Deschutes and Crook and Klamath Counties and I haven't seen but a very small amount of carry-over hay. The hay that is carried over is usually on some old stock ranch. They have got quite a good price for it. (582.) In testifying in Docket No. 17000 of the Interstate Commerce Commission the other day when I was telling of the distressed condition of the farmer, I was talking about the wheat farmer, not about the hay farmer or the irrigated farmer. The wheat farmer is not the irrigated farmer in southern Idaho. The wheat production of the irrigated belt—the increased production we are getting from wheat on these projects which we proposed to bring in irrigation is not enough to offset what three days' hot wind would make in Umatilla County, or the biggest wheat county in the State of Oregon.

Umatilla County produces from 5,500,000 to 5,600,000 bushels, and as to whether that is more than the 10 southwestern Idaho counties produce, I don't have those figures. I would think it would be, but I am not sure about that. (583.)

297 Q. And yet you tell the commission that it is necessary for you to go over here to Malheur to get nine thousand tons of wheat to bring to western Oregon?

A. That is a different class of wheat, if you know anything about wheat. Irrigated wheat is of a low quality, usually does not go for milling purposes and it usually does for feed purposes. Now, then, as to wheat, I used wheat here because I was figuring that they would produce quite a portion of it, but they might produce barley and get a larger yield for it, as long as there is a demand over here. There

is going to be that tonnage here; that is what I maintain, and the tonnage will move westbound.

Q. You have got 227 cars to fill out, notwithstanding the fact you get an excess surplus production in western Oregon?

A. There is not a surplus production of all feed in western Oregon.

Q. All right. Coming to your alfalfa—you were talking about your hay—your say that you can move that 400 or 500 miles all right, and you would have it over there, consumed in western Oregon. Are you going to bring hay from Malheur into western Oregon?

A. Yes, sir.

Q. Well, now, even at higher rates from Klamath Falls or from Hermiston, or Umatilla County. Is that right?

A. We may get an adjustment of rate. (584.)

As a matter of fact, Malheur County has been embargoed for the last seven or eight years. It is afflicted, and practically all of those southern Idaho counties, with the alfalfa weevel. And the best efforts of the most experienced men in their line have as yet
298 developed no way, except a certain character of fly that is brought from the Mediterranean that will exterminate the weevil. In fact the State board of horticulture this year believes it is becoming less and less a problem in Malheur County. The State board of horticulture this year considered removing that embargo on Malheur County hay, and that is not going to continue. (585.)

It is true they have been trying to get the embargo lifted ever since Baker County made its protest five years ago, but the situation has never been as improved as it is now. There has been constant improvement.

Q. The weevil is still there, and they will not be permitted to ship so long as there isn't any weevil in western Oregon. Isn't that true? (586.)

A. Well, now, I don't know that that is going to be the case. We don't know whether the weevil is going to be as serious in western Oregon as in that high-altitude country. Now, if it isn't, if they find the weevil doesn't live in western Oregon, why, they will probably permit shipments here. Now, maybe research will develop that point.

When I made this estimate and put forward the shipment of hay in volume over the cross-State line from Malheur County, I was perfectly conversant and familiar with the fact that shipment has been prohibited for the last seven or eight years and that the weevil is still there. I was also conversant with the fact that livestock shipments from Nampa, from Huntington east, had to be stopped at Huntington and unloaded, and I heard you [Mr. Spencer] say that the shipments went right straight on through, because of the alfalfa weevil, the other day. In other words, you wrote into the record that the shipments of livestock originating at Nampa went right straight through to Portland. The fact is that they

299 are unloaded (587) at Huntington and those cars are cleaned and that stuff is burned there, in order to protect the spreading of the alfalfa weevil. The State board of horticulture started that in there. Mr. H. H. Witherspoon told me that, and I know they have employed a man on the job there permanently for the last seven or eight years; that is, at Huntington, to clean the cars.

Q. And you say they unload the stock? That is your information, is it?

A. Yes, sir; that is what Mr. Witherspoon told me, and that is the provision of the quarantine.

Q. It isn't done, anyway.

A. It has been done.

Q. It goes through without an unloading from Nampa to Portland.

A. It has been done.

Q. Yes?

A. I know it has been done.

Q. But your information is that they are that exacting and that careful about the movement of alfalfa and the spread of (588) the weevil from the southern Idaho territory——

A. If they are not doing it now—yes; that is right. If they are not doing it now, it would indicate that they are letting up, not so strict, in the enforcement of the quarantine because the condition is not so serious.

This Willow Creek irrigation district to which I credit 27,600 acres on sheet 1 of my Exhibit 1—that isn't a project. That is the run-off of Willow Creek, according to the State engineer's report. That is just the land irrigated from the waters of Willow Creek, the watershed.

300 Q. You represent it here as lands irrigated. Now, don't you know, as a matter of fact, that the Willow Creek irrigation project was initiated to reclaim fifty thousand acres on Willow Creek north of Vale?

A. I am not talking about the Willow Creek project, Mr. Spencer, on this list here at all. I am talking about the (589) Willow Creek water-shed, according to the State engineer, the land that is now irrigated, and you will find that in the State engineer's report as being irrigable land in Malheur County.

Q. Now, that project was dissolved and taken into the Vale project, wasn't it, a part of it, and the waters of Willow Creek appropriated for that purpose?

A. I don't know about that. (590.)

On page 11 of the State engineer's report for 1924–26, you will find "Willow Creek, Malheur County, 27,602 acres." (591.)

As to what it was I expected from this 27,602 acres attributed to Willow Creek, I didn't expect anything, except the tonnage that I am now originating at present. This is irrigated land, and my tonnage figures from Malheur County at present show those are based upon actual production now. Now, whether it has any water or not doesn't

affect my tonnage figures. It is not reflected in the 64,000 tonnage that I gave as potential tonnage. Page 4 of the exhibit consists of the present tonnage. Page 13 consists of the present tonnage plus the tonnage which will be available from these various projects in the county within five years, plus the tonnage which will be available from these projects which are (600) now in the process of construction, ultimately, when they are completely settled.

Since these projects were initiated in there and built, some of them, the initial Vale project—the Willow Creek project and
301 the Warm Springs project, a railroad has been built in there to Crane, and then to Burns, and operated for the last 12 or 15 years.

Q. Do you know whether there has been any increase, year by year, of the production there under those conditions from that Oregon eastern branch?

A. There has been an increase on the Warm Springs; there has been an increase on the Jordan Valley; there has been an increase at Harper, a division of the old meadow lands there.

Q. Now; isn't it true, on the contrary, there has been a shrink on the Warm Springs? It is the worst irrigation failure we have got in the State.

A. Well, there wasn't any water in Warm Springs when your railroad was built in there. If it is producing any tonnage at all it certainly has been an increase.

Q. The Warm Springs, with an acreage of 31,300, only irrigates 13,000?

A. That is right. (601.)

Q. With only 69 residents on the whole project, it was bonded originally for a million five hundred and fifty thousand; that there are two hundred thousand dollars of its bonds in default, and a hundred and forty thousand bonds to the State for interest that it has advanced, in default, and the total interest debt to the State on its advance for that project, according to this engineer's report of 1924–26 to which you refer, amounts to $414,000.00 with interest on interest bonds in addition to that of $101,855.00, and unpaid warrants of $58,283.00—no, that is additional interest unpaid—and with warrants of $25,505.00—all that debt against 13,000 farmed acres—is that the condition of Warm Springs?

202 A. No, sir; not now. There has been, and just about is to be completed, an understanding between the bond holders and the directors of the Warm Springs irrigation project which will reduce the acreage to 17,000 acres, and which provides for the selling of part of the Warm Springs water to the Vale project, in order that the Vale project will have more water; and there is being brought about an adjustment of the situation which you have indicated there. And it appears that in place of 13,000 acres under the Warm Springs, reducing it to 17,000 gives it practically all good

land, and there is all that 4,000 yet to be brought under cultivation, which is the figure that I use here (602) additional land to be brought under cultivation.

And I treat that Warm Springs as a resource for the cross-State line to the extent of 4,000 additional acreage, on the strength that the bond holders and the State settlers up there are going to get together. The condition has been such that if they are going to get anything out of that project they are going to have to do what is right by the people out there. Now, fundamentally, that project isn't all wrong. If you know anything about the financing and construction of Oregon irrigation districts you know that the people have gotten for the expenditure of their money about 50 cents on the dollar. If they had gotten a dollar for every dollar that they put up in bonded indebtedness those districts wouldn't be in very bad condition. But they didn't get it; and now there is adjustment taking place in all those different projects, and ultimately they are going to be adjusted. (603.)

A great many of those bonds are held down in California. I don't know about southern California. I think the Bank of California holds a large amount of those bonds.

303 The Jordan Valley project is in Jordan Valley. It will be about 65 miles from a point on this railroad, over in Harney County, 65 or 70 miles from Venator on this cross-State line. It is just about due south from the Homedale branch. It joins on the Idaho line. It reaches the Murphy branch of the short line or the Homedale branch, either one of them, at a distance of about 65 miles. Now, that project, you will note I am producing commodities on it, and they are producing now largely livestock. They (604) are located such a distance from a railroad that they have to produce livestock. Now, livestock products largely are going to move west from that valley, and I figure on the tonnage that I note there on the low average of 250 pounds per acre of traffic produced, you can take a bunch of lambs out on any acre there and pasture it and you will get more tonnage than that. Now, it is reasonable that they will come out via Venator on everything that moves west.

As to whether that district, too, is in distressed condition financially, it isn't as bad as some of the other districts. It is being settled up fairly rapidly. Those people down there are getting along better than they are on some of the other districts. They have got, according to the report to which I refer, ten resident land owners on the project. They have a good many more residents out there now than this showing here. (605.) I haven't been down there in recent years, but I have talked with people who have been there. There will be a witness here from Malheur County who can tell you how many there are there.

According to this report they have got an actual bond issue
304 against their acreage of $400,000.00, they are in default to the

State for $72,000.00 and $120,000.00, and for $3,930.00, in State interest, with $1,595.00 warrants. If they can get that project settled and get it to producing they will improve this condition materially, and they are making real progress in the settlement of the Jordan Valley project. Every man who goes in there and takes settlement on one of these projects finds that the land he takes is burdened, not with any particular bonded indebtedness, but he is liable before he can get it released, the whole bonded debt has got to be paid and released. As to whether settlers are going in there on these projects when they are blanketed with debt like that, there was a movement in there last year. The people down there are very optimistic. I do know this, I know that (606) that enormous investment is not going to lie down there idle, it is going to be brought into production, and it is going to produce tonnage, because the bond holders can't afford not to have it do it.

The 8,960 acres shown on the exhibit is new land according to the Mead report, new land that will be brought under irrigation. That is not additional acreage for the Owyhee project. That project includes all of those pumping plants there, both in Idaho and in Oregon. I think it is some 46,000 acres altogether.

Q. If they were amply watered by the pumping plants, the production wouldn't be increased, but the cost was so great that it got to be prohibitive?

A. No; that isn't the condition. They weren't adequately watered by the pumping plants, because the water had to be lifted a hundred feet, and that is prohibitive.

Q. So the cost was the prohibitive part of it?

Westfall is in Malheur County, north of the present line that runs to Crane, between Vale and Crane. (607.)

305 There is no question but what there is a connection between the financial condition of these various irrigation projects and the absence of a cross-State line.

The Ochoco, in Crook County, at Prineville, is not the best one of all of them, but it is a very good project. It is at an elevation of about 3,400 or 3,500 feet, down to 3,000, 3,100. I don't know just exactly the elevation. The elevation at Burns is about 4,100, as I recall. The Ochoco project is off there on the Prineville City Railroad, off the main line about 25 or 30 miles, and only until this last year have they had a southern connection. I don't know whether it is about 18 miles from the main line where that branch line runs up there to Prineville. (608.) I have never been over that railroad. I have been over the highway a good many times from Redmond. From the junction up to Prineville there is a branch line connecting up there that is operated by a railroad that is operated by the Oregon-Washington Railroad & Navigation Company and the Oregon Trunk, the Northern lines, and the Union Pacific system.

Q. And the lines of railroad were in there before the project was built and developed?

A. They didn't have a southern outlet to California markets that is going to materially benefit that district, which they have now, just got this last year.

Q. Now, the southern Idaho projects didn't have a California market, according to your statement, either?

A. No.

Q. But they have prospered and succeeded served by only one railroad, and here is a district served by three, in effect, the Northern Pacific, the Great Northern, and the Oregon-Washington Railroad and Navigation Company, and it has failed perhaps worse than any of them except the Warm Springs, isn't that true? (609.)

306 A. Yes; that is true. The point I am making there is with the advantage of those railroads they had two lines in there connecting them with northwest markets and with eastern markets. Now they are getting a shorter route south, and that is where the bulk of the commodities which they grow are going to go.

The commodities they grow which will go south are sheep, cattle, hogs—they don't grow many hogs out there—butter and dressed poultry, potatoes, and go right through the Klamath Basin on their way. Probably the biggest commodity they produce as far as tonnage is concerned is potatoes. They go through the Klamath Basin and the Sacramento Valley and these other valleys long before they reach San Francisco.

Q. Now, they have an irrigable area there at the Ochoco of, in round figures, 22,000 acres—they have got 12,000 acres irrigated, and they have got 79 residents on that whole district, is that true?

A. That was the case when this report was written.

Q. And a bonded debt of $1,425,000.00, and bonds in default of thirteen thousand, interest on bonds in default eighty-four thousand, bond interest to the State on $1,425,000.00, total (610) State interest $406,000.00, interest on State bonds, interest bonds, of $95,541.00, unpaid debts to the district $48,947.00 and outstanding warrants of $59,960.00. Is that the condition reflected by this report?

A. That is the condition reflected by this report.

There is progress being made in adjusting that also with the State board.

Q. And with that condition obtaining at Ochoco, at the terminus of a branch line of railroad only 18 miles in length that connects with the service of three transcontinental railroad systems, you are advocating an irrigation district in the Fort Rock

307 district where the water supply is to come from drilling wells; is that right?

A. That is correct.

Exam. ROGERS. While we are showing the various financial conditions of these projects, is somebody going to show what brought those financial conditions about?

A. That's the point, Mr. Examiner. The fact is that they are things that didn't relate to railroads that brought that condition about.

Mr. SPENCER. The railroads——

A. Now, I say this: That those projects would have been somewhat (611) better off—and that is the question that the examiner asked me—would have been somewhat better off if they would have had an outlet to the southern markets, also the Malheur County would have been better off, the Warm Springs project would have been better off, had they had this cross-State line to carry their projects west, in place of carrying them clear around to Ogden and then down, or Portland and then down.

Q. (By Mr. SPENCER.) That is your speculation, that they would have been better off.

A. That isn't my speculation, for the reason that every shipper in that country would tell you the same thing.

Q. You say those shippers in southern Idaho are all prosperous except the wheat farmer, don't you?

A. No; I didn't make such a statement as that.

Q. Oh, you didn't?

Exam. ROGERS. What I had in mind, the mere recital of these various financial conditions, it seems to me, won't help a lot unless we show what brought about those conditions.

Mr. SPENCER. Well, it isn't claimed that the railroads brought it about. The point is——

308 Exam. ROGERS. Well, it isn't plain that the failure of the purpose for which the irrigation project was launched was responsible for the financial condition. I don't think that is to be presumed.

Mr. SPENCER. Well, I suppose if we investigated this as to (612) the responsibility it would take a long time. There has been a commission appointed, as provided by the 1927 session laws of Oregon, to try to analyze and solve this problem, but the point is that with this great blanket of debt over all these projects—and the worst ones haven't been even suggested——

A. What are they?

Mr. SPENCER. No settlers are going in there on these lands, and without settlers there certainly isn't tonnage for the existing railroads, let alone some more.

Exam. ROGERS. Well, if that were due to financial manipulation rather than the purpose of the project and the character of the land which it was intended to be irrigated, could we reasonably assume that that condition is going to exist for all time, and that there is nothing to the development of that country? You don't need to answer that, but that is just the thought that is in my mind.

Mr. SPENCER. Sure; I am willing to assume, for the purpose of discussing it, that it is a veritable scandal—I don't know anything about it—I am willing to take Mr. Teutsch's statement that—probably he is a little low, but I dare say that in the financing the actual settler didn't get over sixty-five or seventy cents on the dollar, if he got that——

A. He didn't. (613.)

309 Mr. SPENCER. But I think they all demonstrate that no project can succeed without the Government is back of it, that these examples are demonstrations of that fact, and their growth is a slow growth, and we are prepared to show that.

Exam. ROGERS. Well, of course, the mere statement of counsel to that effect won't have any bearing. We will have to have something more than that, if that is a fact and that is to be relied on.

Mr. SPENCER. Well, I just want to show the conditions of these projects as reported to the State engineer, in the fact of an estimate here by the witness that they are going to settle them and put a lot of tonnage on this road.

Exam. ROGERS. That is just the point I am making, Mr. Spencer—in my mind, one don't refute the other at all. I can see where Mr. Townsend can be right in that report—I can see where the commission can be also right.

Mr. MCCULLOCH. Well, Mr. Spencer, was it your idea in this line of examination to make the point that the unsatisfactory financial condition of these projects within the State was due to the demerits, the intrinsic demerits, of the projects themselves, that the land wasn't suitable for irrigation, or that the water supply wasn't there?

Mr. SPENCER. That is undoubtedly true of the Warm Springs, which the witness has put up, and the Willow Creek, and it is certainly true of Summer Lake and Silver Lake. I don't think (614) it is true of the Ochoco.

Comr. MCMANAMY. I think we will make better progress if Mr. Spencer will proceed with his cross examination and develop the facts.

310 I stated that the actual tonnage westbound on page 1 of exhibit 1 was 23,050 tons. I based that upon the annual turnover of sheep tonnage. The number of sheep in Malheur County, 50 per cent. There were probably a whole lot more sheep than that shipped out of Malheur County. The carriers' records will tell you that. I didn't have access to them. (615.) Exhibit No. 1 does not show that 184 cars of sheep were shipped westbound out of Malheur County. That is what we expect will be shipped if this road is constructed. It is tonnage that is in the county there now. It is my notion of the tonnage that exists there that can move off the cross-State line and represents only a very small percentage of the agricultural tonnage. For instance, the sheep movement there is only 25 per cent of the annual turn-over of sheep and the carriers' actual shipping records will probably show twice that many sheep moving out of Malheur County.

Turning to these irrigated lands of Harney County, first of Silvies River, I put that down as 87,566 acres that can be irrigated by the waters of the Silvies River.

Q. Do you know the duty of waters fixed by the Supreme Court of this State on Silvies River?

A. I don't know what that decision was. You will find that also on page 11, the State engineer's report, as authority for those acreages.

Q. Well, do you know that the Supreme Court fixed as the duty of water 3-acre feet for that district for the three years (616) ensuing from the entry of its decision in June, 1925, as reported in 115 Oregon at page 27, and extending through to page 137 on, and it found that some 62,000 or 63,000 acres was the maximum that could be irrigated; is that right?

311 A. You have the case there. I suppose it will tell whether it is right or not. The point there is, however, that during flood seasons, regardless of what the Supreme Court may decree, that that water has to go down and irrigate something, and it probably irrigates 87,000 acres. According to the State engineer it does.

Q. That is this same meadow irrigation that you were talking about, too, isn't it?

A. Yes; all Harney County irrigation is practically this same meadow land irrigation.

Q. Yes; and the Blitzen, you claim—the Blitzen is a private project, isn't it, or private enterprise? It isn't a project at all?

A. None of these are projects, Mr. Spencer.

Q. Well, the Silvies is——

A. They are all water sheds. In other words, they are the lands irrigated by the water sheds run-off of Silvies River.

The Harney Valley irrigation district has been organized. On page 39 of the report (617) of the State engineer, the insert table following page 38, the engineer lists as irrigable land 75,000 acres, and lands now irrigated in the manner I suggest of 61,000, but that does not include all the lands irrigated by the Silvies River. It just includes the lands that are now irrigated by that river in the boundaries of that project. I don't know the run-off of the Silvies River, according to Federal Engineer Newell, over a period of years. I take it, though, that the report of the Federal engineers on those projects took all those things into consideration when they made the reports, and I am basing my statements upon their report.

312 And the Federal engineer's report on that project was made in 1926 and 1927. I have not referred to that. (618.)

Referring to Exhibit No. 13, the irrigation map, I believe that the Middle Fork of the Malheur comes in at Drewsey. The lands that I refer to as available for irrigation are north of Drewsey. Those lands are not available for irrigation; they are now irrigated. They are little shoestring valleys and whatever there is in the way of production there comes down to the existing railroad at Riverside. Any alteration would not affect my tonnage figures either the present tonnage or that to be available.

Q. And Silver Creek—Silver Creek is some 25 (619) miles north of—that is, the district location, 25 miles north of the cross-State line, is it not, and north of the Double-O ranch?

A. Well, the reservoir. It strings along Silver Lake. The lower end of it would be down fairly close to the Double-O ranch. It is going to control water on that empty land down there, supposed to do that. (620.)

Q. Well, that is a flat from the lower end of that reservoir down to the Double-O ranch—the district would be all north of that commencing at a point probably 20 miles parallel with and north of the cross-State line, and goes along back up to the slope, does it not?

A. I think probably——

Q. Have you been through there?

A. Yes; I have been through there. I think probably you are a little far; that is, the lower end of the project would be closer to the proposed railroad than that.

Q. In any event, in this report of the State engineer—please refer to that again, that insert at page 38—that is the Silver Lake irrigation district. What is the irrigable area of that district, according to that report.

313 A. Silver Creek Valley irrigation district is 16,300 acres. I do not have it listed on page 5 as 23,669. I am talking about the waters of Silver Creek and you are (621) talking about the Silver Creek irrigation district, and they are two separate things. The 23,669 acres shown on page 5 is the total irrigable area as reported by the Oregon State engineer as being irrigated from the waters of Silver Creek. In my exhibit on page 5 I am not talking about the project at all; I treat that later. The significance of my figures of 23,669 acres is this: I just want to show what the engineer reports as now being watered by the natural run-off in Harney County. That shows a total of 218,603 acres, and it is that acreage (622) that supports the whole agricultural industry of Harney County and provides for the origination of all the present tonnage that I have estimated here.

Q. Well, there is no such acreage as that [23,669], watered or dry or anything else, in that watershed, is there?

A. The State engineer says that there is, and I think there is—that Silver Lake runs on down into the Double-O ranch, and irrigates that whole country down there. You know that, don't you?

Q. No, nor you don't, either. (623.)

Page 5 shows the present shipments of Harney County westbound as 650 cars. I arrive at that in this manner. There are 185,730 sheep in Harney County from which there is an annual turnover of 50 per cent or 92,865, which are marketed annually; while all of the lambs now move east, approximately 25 per cent would move to California as fat lambs via the proposed line. As to whether I have any actual shipments there at all, I don't know as that is a mere estimate. That is based on the actual number of sheep in

314 Malheur County, and we know that for the Northwest the turnover is 50 per cent and that is low, but there could not be any less than that and there could be a whole lot more. Now these

are the shipments westbound, my estimate, representing 25 per cent of the lamp crop in Harney County.

Q. Yes; now, you could obtain, of course, the actual shipments as they move. You don't contemplate any substantial increase, do you, of livestock in there? (624.)

A. No; the only figures in livestock will be as the result of bringing under production these new lands, which we figure. There might be some increase in cattle. Harney County now—this cattle population is about 50 per cent of what it once was, and there could be a substantial increase in the number of cattle, and the cattle would all move west.

My estimate of the total movement of cattle, sheep, hogs, wheat, and horses westbound of 650 would not be somewhat large. I said 25 per cent of the sheep, all of the cattle, hogs, wheat, and horses would go west. I think I know how much of the wheat went west last year—67 cars of wheat were shipped from Burns last year. As far as wheat for export is concerned, last year (625) was the first time they planted any considerable acreage in wheat and the shipments show it from Burns. The railroad was completed into Burns in 1924—that may be correct. When I say that wheat is for export I do not mean for export from there locally; I mean export as milling wheat to leave the country. I say that Willamette Valley wheat is exported because it is an export wheat and this is soft wheat over there in southern Idaho and is going to be used locally in western Oregon; that is substantially my statement. (626.) It is a fact that the western Oregon wheat is soft wheat—the same
315 character of soft wheat as the southern Idaho wheat. And the southern Idaho wheat goes to the Southwest and is consumed there. There is a substantial difference however in the price that the southern Idaho and Harney County farmers get for the wheat and the Willamette Valley farmers get for their wheat. Irrigated wheat is quite often more foul with weeds and takes a lower grade and is of lesser value even for milling purposes. When it is used for milling purposes it goes as export flour. As to whether a practically large percentage of it at least is consumed by the mills in southern Idaho and at Ogden, I don't know about that. I know that a good many of the dealers in Ontario and Vale ship to Portland. I take it that all the wheat in Harney County would move west, every pound of it.

Q. Now, you cite as producing tonnage for the cross-State line the counties of Klamath, Deschutes, Crook, Jefferson, and Wheeler. How is that business going to get to the (627) cross-State line from either Klamath County on the south, that is served by other railroads, or from Deschutes, Crook, Jefferson, and Wheeler, which is on the north and served by other railroads? Page 13?

A. Well, we will take Deschutes, Crook, Jefferson, and Wheeler Counties, which are treated as a block, and how that is going to get there. The tonnage which I have estimated as originating in those

counties is the following—there are 149,955 sheep in those four counties—an annual turn-over of 50 per cent; that is, 74,977 sheep are marketed annually. Seventy per cent of these go as feeders to the feed lots of the Northwest, in Idaho, and on to the mid-west. I figure that that tonnage originating at Prineville, Madras, and the Wheeler County stuff is driven and now marketed at Prineville, to come out that way, it would be the shortest route for
316 them east over smoother country, through the feed yards to which they now go. On that basis I made these estimates.

Q. You have taken this business away from existing railroads that don't pay their operating expenses, in that Deschutes Canyon. Is that right?

A. I don't know about the actual figures.

Q. Well, you are not considering the existing railroads as necessities at all in your estimates. Is that right?

A. Well, I should think that livestock movements will take the—certainly, as a shipper I would take them over the (628) smoothest line, instead of bumping them down the Deschutes, down hill, and then across along the Columbia River and up over the Blue Mountains and down hill again into the feed territory; I would take them along the smoothest route if I were a shipper, and I think that is what other shippers would do.

As to whether there is any preference in the Malheur Canyon as compared with the Deschutes, I think there is quite a difference. I don't think it is in favor of Deschutes. I have ridden over both of them. As to whether it is a good deal better railroad into Bend than to Burns, it may be better; but I notice I got a lot of bumps going up there or coming down either one. I have been over the other one with a livestock train and passenger train and say that the Malheur Canyon is a little the smoothest. As to whether there is any comparison as a matter of maintenance and quality of road, as far as railroad construction is concerned, as far as rails and ties, I think the Bend line is a better road. (629.)

As to how I anticipated the Jefferson County traffic, it would move over the cross-State line. Most of that stuff is loaded up there at Madras, comes off the range—you see, sheep would come off
317 the ranges there—and goes as feeder lambs, and moves to the feed lots of the Northwest. These are largely in Idaho. They are cross-bred lambs. The ewe end of them is taken out for replacing flocks in Idaho and they take the others out and ship them to California.

Q. The line that takes them out brings them back as feeders, don't they, as a rule?

A. The line that what——

Q. Feeders get a low rate to the feeding areas, do they not?

A. I suppose they do.

Q. And the line that takes them out brings them back as a rule?

A. Well, they go on east, the large percentage of them, or south to California.

Q. Oh, feeding in transit?

A. They don't come back.

Q. Well, some of them do?

A. Very few of them. A few lambs move from the southern Idaho country into Portland, but Portland is a very small market, and that is a very limited quantity. (630.)

The southern border of Wheeler County runs up into the Blue Mountains and there is where the sheep graze. When they take those lambs out of there, they load them at Prineville.

As to whether I think they will bring them down to the existing roads of Prineville and deliver them to the cross-State line to haul out to Ontario, instead of moving by the railroads that receive them, the stockmen would designate that route that they should take if that road were built, I believe. They would move to south Idaho. Get these projects in Malheur County and that will be as great a feeding area as we have in the entire West.

318 Mr. SPENCER. The tonnage you have in Grant County, on page 14, is taken away from the Sumpter Valley and brought down to the cross-State line. Is that it? (631.)

A. It wouldn't take very much tonnage from the Sumpter Valley; not very much tonnage moves out on the Sumpter Valley right now.

Q. It is impoverished railroad but it serves that country, doesn't it?

A. It was built in there to get the timber. It was built by the operators to get the timber back to Baker. That is what it was built in there for. It is a road that you have to switch back in over the mountains, up over a circuitous route and turn circles. Not very much of the livestock is shipped out over that road. It is moved from Austin. The stuff from Grant County comes out from Pilot Rock and Heppner and Prineville, and Seneca since the Herrick line was built.

Q. Well, notwithstanding your aspersions of the Sumpter Valley road, it has been a factor serving in the development of that country in the last thirty years, and before you were ever in the county promotion business, wasn't it?

A. I don't know; the first time I ever went up to Prairie City, about 20 years ago, it was in there then. I don't know how much before that it was there.

Q. And you think it is of no importance whether it is stripped of its business or not?

A. Well, it isn't getting the business now. How are we going to strip it of any business? It is there, and we are not using (632) it. How are we going to take any away from it.

Q. It is operated every day, isn't it?

A. Yes; it hauls lumber, very few livestock, and I am shipping livestock. It is only a small portion that is produced in Grant County.

319 The Sumpter Valley Railroad just comes down out of the Blue Mountains. The John Day Valley ranges have a large number of livestock in Grant County or south of this line, and are tributary to Seneca, which is the end of the Herrick logging road extending from Burns up into the Bear Valley, and I am estimating that there is going to be an increased movement of (633) livestock from Seneca because it is a shorter route. You don't have to go over a narrow gauge—you can load onto broad-gauge rails, and it will carry you out to California markets and it will carry you west, and that is the way stuff will move. In mentioning that you could load on broad-gauge rails from Seneca I had in mind that the Sumpter Valley is a narrow-gauge road and you would have to unload at Baker, and you can load at Seneca and carry it right through. Seneca Valley is a common carrier, but I don't know whether its securities have been issued by authority of the Interstate Commerce Commission; but I presume that is true. As to whether I know that it requires all the business that it can get from that rugged country, which it penetrates to sustain it, I don't know that that is the case. I know that the (634) Interstate Commerce Commission granted permission to the Herrick Lumber Company to build a road up to Seneca and use it as a common carrier. I presume they want the traffic to go out that way. I know it is a service to the stockmen that it should go that way. (635.)

All of the sheep that move from the Seneca country have gone east. Now, of course, that is where it has to go. There is no other market for it to go any other place. The cattle went east too; they went to Nebraska, the bulk of them last year—on the feed lot there. This year, however, they may move to Seattle, and they have moved west previously (637); that is, the stuff that is grazed up in

320 Bear Valley by Southwick brothers, by Oliver brothers, and several others; a lot of it goes west. In fact, Southwick shipped his steers to Portland last year. They either load at Seneca or drive to Burns. They have the railroad in there now and they are going to load at Seneca.

Q. Now, if they ship to Baker, and the Sumpter Valley, where it is brought west, a westbound movement, to avoid a substantial distance in mileage, don't they?

A. No; they don't avoid anything. They are right on their grass in Bear Valley now, that livestock, and if they go to Prairie City they have to tail about 40 or 50 miles and they get a shrinkage, and then they have to load on a narrow gauge railroad and go up over a mountain. In fact, they don't move any stuff out that way.

Mr. McCulloch. You mean by the Sumpter Valley?

A. Yes; by the Sumpter Valley. Seneca is right in the grass producing area, and that is where the livestock are in the summer time.

Q. (By Mr. SPENCER.) That country has been shipping out by the (638) Sumpter Valley and Baker for years, hasn't it?

A. From Austin quite a little stuff moves. I don't think that practically any livestock moves from Prairie City. They move off the ranges of the Blue Mountains up there at Austin, which is up on the summit——

Q. Before they had the Herrick road in there where did they go?

A. The stuff I am talking about that was being shipped from Seneca was trailed down to Burns, when they got the line to Burns; before that, to Crane.

Q. As a matter of fact, if they go out to Baker, they escape one extra feed, and they save some two hundred miles in distance, don't they, if they are going to the coast?

A. Well, those other conditions, though, offset that.

321 Q. Oh, they do?

A. Oh, if they don't, they would be using that line, and they are not using it.

I classify as potential for the cross-State line the development that is going to result from the Summer Lake irrigation district. That is on page 10, and I classify there as available 5,000 acres. I am familiar with the history of that district. (639) The dam has not gone out. The conduit broke and washed out a section at the bottom of it, and they built a stillway for it. They did not build an entirely new dam there for it. They just repaired a portion that washed out. (640). I have been right in there and looked at it. One end of that dam did go down and break out, but that did not require construction of a new dam. It required the repair of the old dam.

According to the table at the bottom of page 38 of the report of the State engineer, 4,941 acres is the total area in the project and they are now irrigating 708 acres according to the report, and I think that is about right. The number of land owners is 24 and the number of residents is 9. The situations in the Summer Lake project and the Silver Lake project are identical with those on the Ochoco. There are plans being made now from which ultimately the bond holders will get (641) together as to what land will stand which will permit settlement.

Q. Now, the settled and cultivated irrigated lands in that project are burdened with a debt of $415,000.00, are they not, according to this very table that is before you, a debt of $572.00 for every acre that is now irrigated and cultivated, and you put that in there as a potential resource for the cross-State line?

A. Yes, sir; and I believe——

Q. And how many miles is it south of the cross-State line?

322 A. It is probably about 25 miles.

Q. Isn't it about 40 miles?

A. Well, directly south—you go directly north from Summer Lake and you won't be very far away from the cross-State line. The Summer Lake project is at the north end of Summer Lake, and that

is 50 miles from the railroad at Lakeview. It either has to go to Lakeview or it has to go to the cross-State.

I know Mr. W. L. Powers of the State Agricultural College. He is head of the soils department. (642)

Dr. Stevenson is an assistant of the soils department of the Oregon Agricultural College.

I know something about the alkaline condition about Summer Lake. I have probably been over that project more than Dr. Powers has. It is not at all probable in my opinion that any settlers will go on the Summer Lake project until there is an adjustment of the bond holders. But that is being brought about. They are considering the matter. In fact, a State engineer announced not long ago that they expected to get to a definite conclusion before long. As to whether I think that with a railroad 25 or 30 miles away it would be helpful to that project, it certainly would be more helpful than one 50 miles away, and tonnage which I have estimated from that project was based upon things which can be readily moved.

Q. Then you go down here and you carve out 46,000 acres out of the Fort Rock and the Christmas Lake Valleys as an irrigation project. That project has been dissolved, hasn't it?

A. I don't carve that out as an irrigation district. I carve (646) it out as a possible development on the basis of individual pumping units.

Q. How did you happen to arrive at 46,000 acres?

A. Because that is the reasonable amount of good land in that valley, to my personal knowledge, which will be—or permit medium lifts.

323 Q. The only cultivation they have in there now is 50 or 60 acres on a well that was drilled by the State at the State's expense some five years ago. Isn't that true?

A. The well was drilled by the State, and then it was appraised and then was sold to Mr. Ernst, upon whose place it is, for $430.00.

I don't know how much it cost the State. I know that they appropriated, including the geological survey and everything connected with it, and they put down four wells. This was not the only well except a well on the Cranston place that produces water at all. They all produced water and they all tested out.

Q. How does it happen that they haven't produced any crop over there except on this Ernst place? (647.)

A. Well, they have been doing it under difficulty. When you are 60 miles from railroad, and no means of transportation to get products out, it is difficult to get capital to develop anything.

Q. Well, if they have plenty of livestock feed they do it, you say, down in the Jordan Valley. Is that right?

A. That is right, from a gravity project. They can't do it on a pumping basis 60 miles from a railroad.

Q. As a matter of fact, the east end of that valley is all hardpan, isn't it?

A. The east end of the valley?

Q. Christmas Valley?

A. What do you mean by hardpan? All of eastern Oregon is underlaid by hardpan at various depths.

Q. The hardpan is on the surface, except where there are sand ridges and sand dunes are piled up. Isn't that true?

A. Some sections of it, but there are 46,000 acres and more
324 than that of good land there that is susceptible to water, out of two hundred and some thirty thousand acres.

Q. If it is only 20 or 30 miles from an existing railroad, why isn't it settled?

A. Twenty or 30 miles?

Q. Why, certainly, from Fort Rock to the Great Northern (648) Railroad, and from Fort Rock to the Southern Pacific Railroad.

A. It is more than that. And that is at the west end of the Fort Rock Valley, and Christmas Lake Valley extends a long ways east from there. The town of Fort Rock is at the extreme west end of the Fort Rock Valley, quite a good ways from Fremont, and Fremont is right at the edge of the timber.

Q. But it isn't any thirty miles from the Great Northern Railroad to the head of that district, is it?

A. It is farther than that, I would say.

Q. Well, you look at the map by your townships there and you will find out that it isn't.

A. Let's see where there is a map that shows—it will be about 30 miles from Fort Rock, I would say, to the Great Northern.

It is 46 miles from Fort Rock to Crescent, which is almost due west from Fort Rock. (649.) It is between 25 and 30 miles to the Great Northern Railroad (650), but it is closer than Summer Lake right now. The project at Summer Lake is already built; the dam has been put in. So has the Silver Lake Dam been put in. I understand in the Fort Rock Valley there is an additional 200 acres been seeded to alfalfa, and there will be a pump on it this year. (651.)

Mr. McCULLOCK. Mr. Spencer, I wish to say, before you commence, that I have read the letter that you received from Dr. Powers, of the Oregon Agricultural College, and I have no objection to
325 your cross-examining the witness and offering it in evidence in connection with his cross-examination, if you desire.

Comr. McMANAMY. If it is very short it can be read into the record.

Mr. SPENCER (reading). "Oregon State Agricultural College, school of agriculture and experiment station.

"Corvallis, July 31, 1928.

"Mr. Robert E. Shinn, U. S. National Bank, Salem, Oregon.

"Dear Sir: I think there will be but little land culled out of the Silver Lake project, either on account of alkali or porous texture. Summer Lake project has been classified by Dr. Stephenson, and perhaps one quarter of that project will be too alkaline for economic use other than pasture. The project contains perhaps 4,000 acres.

"Yours very truly, R. L. Powers, chief in soils." (653.)

The WITNESS. You notice the point in the letter is that one-fourth of the area is two alkaline to be used for economic purposes other than for pasture. You (654) know that in that territory sweet clover grows; that that land does produce good and abundant pasture, even though it is too alkaline for the production of other crops. The tonnage derived from that pasture land under water would not change my figures here at all.

Q. (By Mr. SPENCER.) Well, the presence of alkali there has kept the settlers off of it and will continue to until they get water, will it not?

326 A. That will keep them off until that is adjusted.

Q. Now here is Douglas and Lane County, and Linn County, Benton County, Lincoln, and down in Coos and Curry, Josephine and Jackson. Now the tonnage you estimate for the cross-State line from those counties, in your opinion is it as assured to the cross-State line as the tonnage that you estimate from the southern Idaho and eastern Oregon counties?

A. I think the bulk of it will naturally take the shortest route east, and feeds will move from eastern Oregon to western Oregon; that it is conservative.

Q. Well, I am talking about the western Oregon counties now. And your estimate of tonnage available for movement from them over the proposed cross-State line. Now do you think that it is as probable that this tonnage will move via the cross-State line as it is probable that the tonnage you have estimated from the eastern Oregon counties will move over the (655) cross-State line?

A. I think practically so, to the extent that these fruits and perishable commodities will follow the shortest route—that is the basis upon which I make these estimates—to the consuming markets.

Q. (By Mr. DEY.) In what, Mr. Teutsch, did you find the basis for the estimates of the tonnage that you allocate here to the cross-State line if it is built from Western Oregon counties? To take a specific case, you estimate from Lane County three cars of clover seed; now how did you arrive at three cars?

A. There are 5,500 acres of clover which has produced on an average three carloads of clover seed for export out of Lane County, which moves east via rail. That is, that don't represent the total acreage or the total shipments out of Lane County; it does

327 represent the amount that dealers told me moved on an average to eastern markets via rail.

Q. Well, you had nothing more definite then as to past movements to the East than what the dealers told you moved?

A. Actually shipped—what shippers who handled these seed told me.

I did not go to the railroads or get any of that information from data furnished by railroads. (656.) I did make inquiry as to how much seed moves to Portland and then east by water. The larger

portion of it moves that way. But I excluded all of that from my estimates.

Time is but essential with respect to the movement of some classes of seed. Now dealers told me this in the Willamette Valley: That clover seed, which is a commodity of high value will move in larger proportion by rail because of the amount of money tied up in a car, and they want to get that money released as quickly as they can, rather than by water. So that clover seed, because of its value has a tendency to move more by rail that rye grass seed, for instance, which is only worth 4 to 4½ cents a pound as compared to 25 or 30 cents for clover seed.

Q. Then how would you explain these figures: The Southern Pacific handled out of Lane, Linn, and Benton Counties, which are three of the counties you cite here, 51 cars of clover seed, of which only 10 went east by rail and the bulk of the (657) remainder came to Portland and must have moved out by water? You would not say that clover seed is not moved by water, would you?

A. No; I didn't say that. I said there was tendency to move clover seed by rail more than there was a tendency to move rye grass seed by rail. I think those figures are about consistent with my estimates

328 I have estimated here from three counties, Lane, Linn, and Benton, 10 cars of clover seed moved east over the cross-State line including in Benton County two cars of clover and vetch. I am giving to the cross-State line all of the clover seed that has hitherto moved east by rail if your records show that. I don't know how many you move, what your records show, but I know from what dealers tell me that approximately 10 cars from those counties move east. (658.)

As to why it is reasonable to suppose that this traffic which originates on the Southern Pacific lines in western Oregon is going to be routed, in so far as the eastern (659) movement is concerned, over the Alturas route, it having been routed in the past through Roseville, Calif., I don't know about that. Your Alturas line is not yet built. I based these figures upon the present routes. My estimates were based upon them. Your Alturas line will be about 200 miles further. On a commodity such as clover seed I don't suppose that shippers would pay particular attention to routing, because it is nonperishable.

Q. And to that extent, then, at least, your estimates may be incorrect here as to the volume of traffic?

A. That all depends upon the completion of the Alturas line.

Q. Yes. It is reasonable to expect, is it not, that if the Southern Pacific Company in the past has enjoyed this business over its Roseville route, which is 400 odd miles longer than the proposed cross-State line, that it will be able to retain to its rails a substantial percentage, if not all, when it has the Alturas route, which is only 215 miles longer than the proposed cross-State line? Isn't that a reasonable expectation?

329 A. I think that is likely. I think the point there will be determined by the division of rates over local, the revenue which the Southern Pacific will derive from a car which originates in the Willamette Valley and moves east via one route as compared to the other. On clover seed, this commodity of clover (660) seed, which makes up a very small tonnage and is a concentrated product moves in very small volume.

Q. I know. I am only taking that because it is the first item on your list.

A. Yes; take perishable commodities—take perishable commodity like broccoli, or cherries, or something of that kind——

Q. Yes; we will come to that. Now then, during the time this clover seed has been moving through the Roseville route, take the county of Linn, which has eight of the nine carloads that move east, there was a route opened through Portland, only 45 miles longer than your proposed cross-State line on products from Linn County, and if that traffic has moved through Roseville in the past, do you think there is a chance of it moving over the cross-State line within the Alturas line completed, so far as it originates on Southern Pacific lines, which it does? Is there a reasonable chance of your getting any of those 10 cars, as you call them, or nine cars, as our figures show, for your cross-State line, in view of the past history of a route through Portland, only 45 miles longer than your cross-State line?

A. Forty-five miles longer? It is more than that from Lane County; it is 90 miles from Lane County.

Q. I am talking about Linn County. That is where the bulk of it originates. (661.)

330 A. Linn County?

Q. You understand what I mean. In the past the Portland gateway has been open for that traffic.

A. Yes.

Q. Yet it has moved 400 odd miles longer than the cross-State line, through Roseville, when this gateway was open through Portland, only 45 miles longer than your cross-State line. What chance under those circumstances, in the light of the past history, has the cross-State line got of getting a single one of the ten cars which you allocate to it? Now as a reasonably fair proposition, what chance has it got?

A. Well, I will say that the bulk of it has moved by Roseville. You are shortening that route 200 miles. It is not likely that a large percentage of the clover seed would move that way, unless the Southern Pacific found more profit in moving it over another route.

Q. Well, it is evident, isn't it, that the Southern Pacific has not found any profit in moving it through the Portland gateway during the many years of the past? That is evident, isn't it, because it has not moved that way?

A. They have a longer haul this other way.

Q. Will you answer that "yes" or "no" for the record because the shake of your head does not get in the record.

A. The question was that it has——

Q. It is certain, isn't it, that in the past the Southern Pacific Company has not found it profitable to take a local (662) haul on that down to Portland and route it through the Portland gateway over foreign lines?

A. That is true, if your figures are correct. I am taking your own figures as a basis for my answer to that question.

Q. Yes. Now if that is true with clover seed, a large part of
331 which comes down here to Portland, the largest part of it, and moves out by water, it is also true of any other commodity that you have named here and that does not require very expedited service? The principle of the proposition is the same, isn't it, if the commodity is one that does not require rapid service?

A. That is true. That is very true. There is the point of service that enters into that question, however, Mr. Dey. That is, cannery men and every one else are interested in getting shipments which originate by them in Oregon to their purchasers in the least possible time, and I assume that on the basis of good business they are going to take the shortest route that will give their customers the best service, and I base these figures on that.

Q. That feeling is not any more peculiar to cannery man, is it, than to clover seed producers?

A. It is somewhat different, because the value of the commodity has something to do with it—the time that it comes into consumption. Clover seed is a commodity that is used at a certain time in the spring time in the East; it needs to be there on (663) that time. I think it will be determined somewhat as to the time it was ordered and shipped in the Willamette Valley, as to which route it would take.

Q. Clover seed is a pretty valuable commodity, isn't it?

A. Yes.

Q. Now, you mentioned broccoli a moment ago, and your figures show that there is a potential tonnage in that commodity for the cross-State line of 4,190 tons, 419 cars.

A. Yes.

Q. Where did you get that data? What was the basis or source of the information upon which you compiled that data, rather?

A. The average annual shipments of broccoli during the
332 past four years from Douglas County have been 419 carloads, all of which go east. The broccoli shippers now say that their produce arrives at eastern markets from 24 to 48 hours after similar produce started from California at the same time. There has been as high as 937 carloads, I believe, of broccoli shipped out of Douglas County already. That is what has taken place in the past. I am assuming that if this cross-State line is built that they will at least produce as much as they have one year under present transportation

facilities. That is where I got that figure. It will be still less—the figure that I use will still be less than the total which they have actually shipped in the past—about the same.

Q. Where did you get this average of 400 and some odd cars the last four years. (664.)

A. I got that from the Bureau of Agricultural Economics, carlot shipments of vegetables, and that is assembled at the Spokane office.

Q. That covers what years, '25, '6, '7, and '8, or '24, '5, '6, and '7?

A. I believe that was the past four years, including '27. I believe that is right; I am not sure about that, Mr. Dey.

But I could determine that. The Southern Pacific Company is the only railroad serving Douglas County. I was told by the largest shipper of broccoli that most of it moved via Portland.

Q. I was just curious to know the source of your figures, because, according to our figures, the average was considerably less; 340 cars, perhaps, around in there. Now, in 1925, Mr. Teutsch, our figures show that 53 cars moved out, and in the following year of 1926 875 cars moved. These are cars (665) of broccoli moving out of Douglas County. Can you tell me the reason for that wide variation?

333 A. Yes, sir.

Q. What is it?

A. You recall that the winter of 1924 was a very severe winter throughout Oregon. Wheat froze out in eastern Oregon and the Willamette Valley and it happened to kill some of the broccoli in Douglas County. I think all of the shipments that originated there originated at Riddle, south of Roseburg, which is not usually the heaviest shipping point, that year. I think there were only a car or two moved out of Roseburg that year, and the reason for it was frost.

Q. Well, there were only 53 cars altogether, according to our figures.

A. Yes, I think that is right.

Q. So that your broccoli is not a dependable crop?

A. It has been grown there, Mr. Dey, since 1915, in substantial cars. The first shipments were in 1915, and they reached a peak there in — when was it? What was the year that they shipped 937 cars, or approximately that?

Q. There was no such year, according to my figures. There were 875 cars in 1926.

A. That was the peak year.

Q. That is eastern, of course. Eastern shipment only is what I am talking about here, because we are dealing with a new (666) proposed line to the East.

A. My figures are for, of course, the total cars originating according to the Bureau of Agricultural Economics. And local dealers told me that practically all of that went east, which is the case there. It is only a few cars difference.

334 Q. Well, a difference of nearly 100 cars a year. But where there has been in the past a variation, or a jump from 53 cars to 875, you say that that shows a dependable crop situation?

A. It does not now largely on account of transportation facilities, because they can't reach markets in competition with California production.

This broccoli has been produced in the Umpqua Valley, Douglas County. There is practically none of it growing north of Roseburg. They grow a small acreage. It originates largely at Roseburg—at the stations just south of Roseburg, Dillard, Riddle, and Myrtle Creek. I think the shipper routed it via Portland. As to whether the raising of broccoli is rather a hazardous (667) business, there has been only one failure there and that was due to frost.

Q. Now in 1927 our figures show 258 cars moving east, a drop of over 600 cars from 1926. In 1927 it was over 800 cars more than the year before.

A. There was an enormous increase in acreage during those same years in California. If you had your figures for California you would find an enormous increase between those same years in shipments of broccoli in California. Now, the point is that Douglas County producers have varied their acreage considerably because of the difficulties they have come in contact with. If they could get the same service, or practically the same service that the California shippers and producers can, it would have a tendency to stabilize your acreage. And one thing that would enter into the broad fluctuation there would be the influence somewhat of price, and would be the influence of climatic conditions.

Comr. McManamy. Do you know whether or not in 1927 it
335 was all shipped out of there? Was the broccoli shipped out?

A. I don't believe it all was. I am pretty sure it was not all shipped out. And I know that in 1926 when they shipped their peak crop there was quite a little of it not shipped.

Broccoli is highly perishable and requires icing. (668.)

Q. Now then, figuring the icing facilities at Portland, and which are available to all of the railroads here, and the icing stations along the main line of the O.-W. R. & N. and Oregon Short Line, do you imagine that the same service would be available on this proposed cross-State line that has been built up by very huge investment on the present route through Portland?

A. This occurs to me in connection with that: That at the time Douglas County broccoli moves, which is late February, through March and into April, this cross-State line traverses a territory that is still cool; in fact, it is cold; it will be freezing every night up there in the Cascade Mountains; and they can probably get through them, at least the growers think so, with initial ice, or with less ice than they are now using, over the cross-State line.

Q. Well, it is not very warm up the Columbia River Gorge, is it, and over the——

A. A whole lot warmer; yes.

Q. The O.-W. R. & N. or the Short Line, during those months?

A. It is a whole lot warmer.

Q. And still they use ice, do they not?

A. Yes. (669.)

Q. (By Mr. DEY.) Now take other perishable products, Mr. Teutsch, that don't come in the same season that broccoli does but that come in the heat of the summer and that you expect to move
336 over the cross-State line, how about the weather conditions then with respect to the amount of ice required as compared with the present Union Pacific route?

A. From Douglas County, prunes, pears, apples, would all move during the fall months, when temperatures ought to vary in favor of the cross-State line, because you are traversing a country of higher elevation.

The hot season over the high desert is in August. It gets fairly hot there then. It is not as hot as it is in the Columbia Basin counties in lower elevations, however, and it is not as hot as it is in the Snake River, for instance, or along the Columbia.

I have allocated to the cross-State line all of the broccoli movement.

Q. Now let's take up the item of hay, Mr. Teutsch, Lane County. You have there 40 cars available over (670) the proposed cross-State line and an additional four cars five years hence, 44 cars. The Southern Pacific records show in a period of almost two years, from September 1, 1926, to June 31st, 1928, 51 cars of hay brought in, of alfalfa hay, and that is the kind of hay I understand you expect to bring across?

A. Yes, sir.

Q. Do you think it is reasonable to expect that these other hay-producing districts which have sent in the 51 cars during the period that I stated there will no longer bring in any hay in competition with the weevil-infested area from which your hay is to come?

A. I think that the price at which that hay can be produced, plus the freight rate, to the point it is to be used, will determine from where it originates, and the difference between those other
337 points you are talking about as alfalfa hay producing districts is the difference between a 3-ton yield and a 5-ton yield.

Q. What I am trying to get at is this, and you can answer it very easily, as to whether or not it is reasonable to expect that the Klamath Basin that raises, according to your own figures, some 75,000 tons of alfalfa now, and has more land coming in——

A. No; not alfalfa.

Q. That is all kinds of hay?

A. That is all kinds—all tame hay. (671.)

Q. How much alfalfa? Most of it is alfalfa, isn't it, down there?

A. No; a large proportion of it is wild hay; some tame hay.

Q. Well, this wild hay is not suitable for importation?

A. Not suitable for importation. It is never shipped; it is fed to stock or cattle.

Q. Whatever alfalfa they do raise, do you expect the Klamath Basin and the irrigation districts of eastern Oregon, that are fairly accessible by rail to-day, and the Yakima Valley in Washington, which has been a large producer and shipper of hay into this territory, are going out of the western Oregon market when the cross-State line is completed? Is that a reasonable presumption, a reasonable assumption? Do you think that they are going out of the market?

A. I think they will be forced out of the market, because it won't be possible for them to meet the prices at which it can be supplied from Malheur County, and that is going to determine whether they are going to be in the market or not.

Q. Then in your judgment Malheur County is going to have a preemption on western Oregon for alfalfa hay, absolutely exclusive of the field?

338 A. They are going to have a larger surplus than any section in Oregon. Deschutes County now practically feeds up every pound of alfalfa it produces. You talk about Klamath becoming a great competing district; they are feeding practically (672) all of their alfalfa. And the price of hay in Klamath Falls and Deschutes and Crook Counties is higher than it is in Malheur County.

Q. And when you make that statement you do it with the knowledge of course that the Malheur alfalfa hay has been infested with this weevil for years and they have not been able to ship it out, and of course it has no appreciable value; that is true, isn't it?

A. Well, they are shipping some of it out of the infested area by grinding it into alfalfa meal. That might be done. They are moving how much? I don't know—forty carloads? Do you remember the last case, Mr. Dey?

Q. I remember the last case; yes.

A. Evidence was submitted here that 440,000 tons of hay were going to move into western Oregon, and you are cross-examining worse on this little forty cars than you cross-examined on this 440,000 tons.

Q. Why, yes; the exaggeration of course is just a matter of degree, and we are free to cross examine you on it. Now when, if ever, they get the weevil out of the Malheur hay, it is going to go up in price, isn't it?

A. I doubt that very much. I have lived practically all my life in Malheur County, and I know it has consistently been the lowest priced country for hay in the Northwest because of the enormous

production. With the 100,000 acres of additional (673) land coming under irrigation it is going to have one of the largest supplies of alfalfa that any country here in the West has.

339 Q. All right. They have to cultivate the soil over there the same as they do in any other district, don't they?

A. Yes, sir.

Q. And their seed costs them just as much, and their labor costs them just as much; that is true, is it not?

A. Yes.

Q. Now what factor is it that is going to enable them to revolutionize this alfalfa hay to western Oregon?

A. It is the yield per acre very largely. I have actually harvested ten tons of hay per acre in Malheur County, under irrigation, measured field.

Q. Is there no other place in Oregon at which that can be done?

A. Not that I know of, and I know of every section of the state. I have been in every section in Oregon.

Q. All right. Have you taken into consideration the freight rates that would be involved here?

A. No; I haven't.

Q. Or the length of haul?

A. The length of haul does not appear to me to be unreasonable, considering the origin of hay that is now shipped into western Oregon. (674.)

Q. Well, if the exceptional or higher productivity of the soil of Malheur County is largely eaten up in additional freight rates, why, that would not help the situation any, would it, obviously?

A. It will depend on whether—this will determine their policy there: Whether they have livestock sufficient to consume that alfalfa hay there and get a revenue from it as large as they could by baling it and putting it on board of cars, and shipping it to western Oregon.

340 Q. And if they do have that outlet for it it will never move over the cross-State line, will it?

A. If they do have an outlet they would not ship this forty cars that I speak of hardly.

Q. You have mentioned in your exhibit a so-called Butte Falls Railroad; between what points do you have in mind that that railroad will be built?

A. That railroad was discussed, as I have heard discussed by people of Josephine and Jackson Counties, and it will extend from Butte Falls. I think there has been a survey run across there; I don't know just exactly where it is, but——

Q. From Butte Falls in the Rogue River watershed over the mountains into Klamath Falls; is that what you mean?

A. Well, it is pretty near the summit; I understand Butte Falls is almost at the summit of the Cascades.

Q. Well, where is the other end of it? (675.)

A. And it is practically up there. It would be on your line that runs from Bend to Klamath Falls some place. Just where that would be I don't know. I think I had a map here that shows that. Oh, yes; Butte Falls—the proposal is that it will go—this survey I believe would hit Chiloquin—a connection from Butte Falls to Chiloquin. That would be on a line jointly operated by the Southern Pacific and the Great Northern.

Q. That is, it would run from Butte Falls, from the watershed of the Rogue River, over the summit of the Cascades to a connection with the Southern Pacific's Cascade line, or Natron cut-off, as it is sometimes called; is that right?

A. Yes.

Q. And have you figured out the distances by that route for the tremendous pear crop of the Rogue River Valley? In
341 other words, which would be shorter, the Southern Pacific's new Alturas route, or your cross-State line, for the products of Josephine and Jackson Counties?

A. The cross-State line, I believe.

Q. How much shorter? Would it be appreciable?

A. Probably 150 miles. I don't know about that; I haven't totaled up those figures.

Q. You haven't figured it up?

A. But I think that is about right. It seems to me that I did figure it up once, but I don't recall. (676.)

Q. Well, assuming there is not any great difference in the two routes, do you think it reasonable to expect that those crops or that tonnage that originates on the Southern Pacific lines in the Rogue River Valley is going to get away from the Southern Pacific and move over the cross-State line instead of over the Alturas line?

A. I think probably some of it will go that way.

I think it will go that way instead of the Roseville line. I think some of it would go via the cross-State line—quite a little of it. I know it has moved in the past through Roseville because it had no other choice. It had to go there. I know in a general way how it is handled from Roseville on. It is handled in fruit blocks from Roseville east, solid fruit blocks. In other words, it is taken down to Roseville, Calif., and there combined with California fresh fruit shipments into solid train loads. (677.) It is true it gets expedited service that it could not get if it were not for the California fruit to be joined with it. But I see here that you propose to haul it via Black Butte. You undergo the same difficulties hauling it via Alturas line that we would across the State, if that is the way
342 the Southern Pacific is going to haul, because you connect way out there at Fernley, some place in Nevada, by the time you meet you solid fruit blocks from California.

We would expect to meet a fruit block via the cross-State line over on the Short Line. There is no question about it. There is a large icing plant at Nampa, and all the traffic which originates on

the Union Pacific, Oregon, Washington, and the Yakima Valley, comes right by Ontario.

Q. (By Mr. DEY.) But your potential tonnage, then, from Josephine and Jackson Counties depends, first, upon the construction of still an additional line of railroad from Butte Falls over into the Klamath Basin?

A. That is correct, although I think——

And then it also depends upon the shorter mileage by way of the cross-State line being so important as to divorce that traffic from the line upon which it originates? (678.)

The WITNESS. Now Mr. Dey, I think you left a little misimpression in regard to the hay discussion. May I make an additional statement in connection with the movement of hay from Malheur County to western Oregon?

Mr. DEY. Yes, indeed.

The WITNESS. The principal tonnage I show here is hay which will go to Coos County. The conditions are eminently the same as they are in Tillamook, and I am figuring on the hay consumption there, on the same rate of consumption of alfalfa hay as is now experienced in Tillamook County, for Coos County. Now I doubt if any shipments of alfalfa from Malheur County, even though there is a weevil in the station, would be quarantined against any movement to the coast, because there is not any alfalfa in the coast territory.

343 Q. In other words, you are acting on the supposition that the quarantine regulations may be let down; is that it?

A. Yes; under shipments of the bulk of the tonnage which I have listed here. In addition to that, in the four years I have been going to Coos County I have never known alfalfa hay there to be less than $22.00 per ton, and as high as $25.00 per ton, and now I know we can load alfalfa on board cars at Ontario and Vale at $12 a ton. I assume it is not going to take another $10.00 a ton to get it to Coos Bay, over the cross-State line, almost as much as the producer gets. I think it is reasonable (679) to assume that hay is going to move from Malheur County over to Coos Bay. My authority for that is the men in Coos Bay and Coos County who are leaders in the dairy industry.

Q. You think that the Malheur hay, then, will compete in the Coos Bay country against the Umatilla country alfalfa, when there is 100 miles advantage in favor of the latter in distance?

A. I think so.

Q. You would expect to pay a greater rate—to have a greater rate paid, would you not, for that 100 miles additional haul?

A. Somewhat greater.

Q. And still you think that the cheapness of production in Malheur County would offset that difference in rate?

A. I think that is right, because our data on the Hermiston project shows that the average yield there is less than three tons per acre.

Redirect examination:

The localities in Oregon in which alfalfa is produced in quantities to justify and require rail shipment of the surplus at the present time are as follows: Umatilla County, that is the Umatilla irrigation project; and then further out towards Milton and Freewater, from the Umapine district, in that section. That (680) is also in Umatilla County. A small amount moves out some years
344 from central Oregon, Deschutes and Crook Counties.

There is some production of alfalfa hay west of the Cascade Mountains, and that has been a project which county agents and the extension service of the college have been working on. We feel it is fundamental to increase the acreage of alfalfa in western Oregon, and we have been trying to do it.

Q. Has there been any real want of sufficient to supply the demand of alfalfa in western Oregon, west of the mountains?

A. It has not been sufficient to meet the shortage of legume hay, that is hay such as vetch, clover, and alfalfa, but by a very large percentage, in other words, we are just getting started on our alfalfa-growing program. We expect that to increase, but it never will increase to the point where we are going to take care of the little fellow that has a few cows and no hay. He wants alfalfa, and that is about all we have shipped into western Oregon, is just to take care of those small dairymen, to supply their needs.

As to whether in my judgment shipments of alfalfa hay in substantial quantities into western Oregon, meaning west of the Cascades—will always be needed from outside of that territory to supply the demands (681) of the western part of the State, I think that is true because the coast counties are hay-consuming counties; because of the value of their bottom lands for pasture they are going to continue to buy. The Willamette Valley we hope will be self-sufficient so far as alfalfa is concerned, with the exception of a few carloads imported, as we have listed here forty carloads per year to take care of those small dairies.

I mentioned some shipments from Malheur County of alfalfa meal, that is finely ground alfalfa hay, and in profein content
345 which is a thing that is deficient in Willamette Valley feeds, it is practically equal to wheat bran. Alfalfa meal is used for feed stock and dairy cattle. It is a desirable feed product in the dairying industry. There is no question to that. It is manufactured by putting the alfalfa through a meal grinder, ground very fine, made into a sort of flour, almost an alfalfa flour. It is considered that the weevil, if it is in the hay, is destroyed in that (682) process of manufacture. I have been told by inspectors over in that country that it permits shipments of alfalfa from a lot of the infected area.

In answering a question by Mr. Spencer, in which I attempted to compute the distance from Fort Rock to the nearest point on the Great Northern Railway, I erroneously figured an air-line distance of from 25 to 30 miles. I just took a cross section there right

straight across from a connection. As to whether the topography of the country is such there between Fort Rock and the Great Northern Railway at the nearest point that it is feasible to travel by an air-line distance, I have never been through there but I am sure you could not get through there. The present road, which was put through because of the ease of travel, goes up towards Lapine and Fremont, and then cuts over to Crescent, the former town of Crescent. It makes quite a bend then. (683.)

I spoke of the Herrick road as being built from Burns to Seneca. The name of the corporation is the Herrick Lumber Company, I understand. I could not say whether it is the Malheur Railroad Company; the people out there refer to it as the Herrick line. I do not know what the real corporate name or title of the road is.

Q. Now, Mr. Teutsch, in the figures you gave of land to be irrigated from the waters of various streams in Malheur and Harney Counties, like Silvies River and Willow Creek, and others, did
346 you give that acreage in terms of the amount of land that it was practicable and feasible to irrigate, considering the present supply of water in those streams, or did you give those acreages with reference to lands comprised in certain existing or contemplated projects, irrigation projects?

A. I based my tonnage estimates on projects that are now under construction or have been pronounced feasible. My potential tonnage, that is, the ultimate grand total tonnage, are there now. The list of irrigable lands I took from the report of the State engineer, and that is listed by watersheds and not by projects. (684.)

I use the figures of irrigable lands in my exhibit in the same sense as the figures were given in the report of the State engineer—that is, by watersheds and not by projects—not by named projects.

This so-called meadow irrigation, Mr. Spencer used that phrase—that is necessary in Harney and Malheur Counties for the production of hay. It is the old system that has been used there, and without water they don't grow any hay. There is no question but that hay is an indispensable requisite for the livestock industry. You have to have to winter your cattle and sheep most years.

Q. How would you say the livestock industry in Malheur and Harney Counties, and perhaps in Grant and Lake Counties, I don't know, compared with other industries there?

A. They are the predominating industries. Practically the total agricultural income of Harney County is from livestock.

Q. You have used in a number of places in your exhibit the words, "present tonnage available for movement across the proposed (685) cross-State line"; did you use that phrase, or those words "present tonnage available" on various sheets of your exhibit in the sense that if this line from Crane to Crescent Lake were now in ex-
347 istence and operation the amount of tonnage that you have called present tonnage would be found now in existence and available for movement across the line?

A. That is right, and would move that way—very likely to move that way, on the basis of market and all other considerations.

Q. With respect to a number of these irrigation projects in Oregon that Mr. Spencer asked you about, do you know of any element other than the various financial setups that has contributed materially to the failure or lack of success of them?

A. I think the financial aspects of the thing, as I said, is the thing that has really caused the failure of these projects. It is my opinion and observation out there that the people have got about fifty cents on the dollar of what they are bonded for. Had that not taken place I think those projects would be substantially in sound condition now. (686.)

I am familiar with the agricultural development of Harney County. There is no question but that it is a successful area in which alfalfa is produced. I think our average yield from the experiment station are 7 tons per acre. It compares quite favorably with Malheur County. I think the average yield of the county for all the production would be somewhat lower than Malheur County because of the difference in climatic conditions. Harney County is not affected by the weevil problem. There is no question but that with the construction of the cross-State line it is probable that alfalfa hay could be moved from Harney County into Coos County. The hay will be there. I didn't move it from there because I figured that the yield would be somewhat less than Malheur. That is practically the only difference.

348 Q. But if it is there and is available for movement, how would the distance compare with the Umatilla project into Coos County.

A. It would be materially less than the distance from Hermiston (687) to Marshfield.

Q. Do you know the approximate cost, or the comparative cost of producing alfalfa in Harney County with that in Umatilla County?

A. I don't know what those figures are. It would depend upon the cost of water, of course, in Harney County. Under the old projects the costs would be very low in Harney, where the water does not cost them much. I know there are some men out there producing hay for just about the cost of putting it up—no water costs at all practically.

Q. In your judgment would it be possible to move that hay from Harney County to Coos County over the proposed line, if there is a surplus produced?

A. No question but that it would.

Recross-examination:

I am employed by the Oregon State Agricultural College and the United States Department of Agriculture, States Relations Service. I am a member of the faculty of the Oregon Agricultural College, but I do not have an instructor's position. I do field work practically

altogether. (688.) It is not true that I am employed in this case, specifically by the public service commission, separate and apart from my regular employment.

The cost of growing hay in Malheur County depends on where it originates on whether it is a pumping plant or whether it is under the old Owyhee plant or project, or whether it is on some of the old ranches under the old water right. I suppose the fair average cost of production of hay in Malheur County would be around $6.00 a ton, something like that. In Umatilla County the cost is probably $8.00. In Klamath County the cost would be close to the
349 same that it would be in Umatilla.

The Oregon experiment station is that organization which has the home experiment station at Corvallis, and branch experiment stations at several points in the State, including the Rogue River Valley, Clatsop County, Umatilla County—— (689.)

This organization is part of the Oregon Agricultural College; it is part of the organization connected up with the Department of Agriculture. Just as much a part of it as I am a part of it.

Q. Now, all of this testimony that you have given about Malheur hay supplanting hay from other districts is given without any definite knowledge of the cost of production in any of these counties, isn't it?

A. No, sir; it is not given without any definite knowledge. I will have just the same thing you have there, Mr. Dey, in just a minute.

Q. All right, when you find this we will proceed.

A. All right.

Q. Now the Oregon experiment station——

A. What page?

Q. Page 4, has made an investigation, hasn't it?

A. Yes, sir.

Q. Careful and complete, of the cost of production of alfalfa hay in these various counties?

A. Yes.

With the result that it has found in Malheur County it costs $7.11 per ton to produce. (690.) And in Baker County on the Union Pacific, and Union County, where there is a large production, it costs $6.56 a ton. And in Umatilla County $8.96 a ton or $1.85 more; in Baker and Union about 75 cents or so less than the cost in Malheur County. In Deschutes County and those irrigation districts the cost is shown as $8.41 or $1.30 more than Malheur County.

350 Q. And how much nearer are the alfalfa producing areas of Deschutes County to Coos Bay and all of these other western Oregon counties, than your Malheur County with your cross-State line completed?

A. Let's see; about, from where we would originate this hay, 150 miles.

Q. Nearer?

A. Nearer than points in Malheur County.

Q. In other words, they raise this hay around Pineville, don't they?

A. Yes, sir.

Q. And Bend, and that country around in there?

A. Yes, sir. (691.)

Q. And all they have to do is to send it down here over the Great Northern line, for 65 miles to a connection with the Natron cut-off, then it comes over the Cascade Mountains and it is in western Oregon, isn't it?

A. They don't raise a surplus of hay in the counties you are talking about, nor do they in Klamath County——

351 Q. I know, but they have lots of lands up there that will raise hay, haven't they?

A. Yes, sir.

Q. They produce it for $8.41 a ton in Deschutes County; that is established, isn't it, by this?

A. Yes, sir.

Q. And over in Klamath County, which is very much nearer to western Oregon and to Coos Bay and these other districts we have been talking about, they raise it for $7.62, or only 51 cents more per ton, than they raise it in Malheur County, which is the prize county you have been talking about?

A. Yes; the local price will determine whether they can ship that hay out or not. If they can get as much for it in Klamath County, Deschutes and Crook Counties as they can for shipping it, they won't ship it because they will keep it on the farm.

Q. For the same reason, if the Malheur raisers can get as much for it by keeping it and feeding it to livestock instead of shipping it, it won't move across the cross-State line, will it? (692.)

A. No; it won't move, if they have the livestock and can get as much from it they won't ship across the State. Now these Malheur County cost figures here, $7.11, are taken, a good many of them, under pumping plants that lift water 100 feet out of the Snake River. Those costs are higher than they are going to be on the Owyhee, in my opinion.

Q. Well, it is all in Malheur County, isn't it?

A. Yes, all in Malheur.

Q. And that is the county you want to produce this alfalfa?

A. They are going to produce this hay we propose to ship on the Owyhee, or on the Vale project—the Vale project. There they will have 40 years to pay for the water right in, without any interest. Now then, if you will turn to page 11——

352 Q. Just a minute, now. If you will turn, please, back to this page 4 for a moment. The average of all of this is $7.90, isn't it?

A. $7.99.

Q. That 99 is blurred here. All right, $7.99. That is the average cost of the counties set forth, including Malheur. Now then, have you ever shipped any hay?

A. Yes, sir.

Q. You know it is one of the least productive commodities, so far as the railroads are concerned, don't you? (693.)

A. I don't know as to that.

It is true it does not load as heavy as lots of products and usually takes a very low rate.

The average importations of hay in Coos and Curry Counties are about 2,500 tons per year now. Part of that comes in by boat. I believe about 600 tons of it comes in by rail. Maybe that is increased a bit since I got those figures.

Q. I think you are about right there. You have 600 tons here in one place and 40 cars. That refers to Lane County. But our figures show there were imported into Coos and Curry Counties 57 cars by rail from September 1, 1926, to May 31, 1928; that is about a year and nine months period.

A. Let's see. What period was that?

Q. From September 1, 1926, to May 31, 1928, about a year and nine months. Thirteen cars from the Rogue River Valley and 44 cars from eastern Oregon and Washington.

A. Yes, sir.

Q. Now, then, with those figures, which you will find I think to be accurate, how do you explain the fact that in 1924 there were 167 carloads of hay went into that same territory, those two counties, in one year—Coos County alone, I guess. (694.)

353 A. Yes; the reason for that was very largely that what moved in there in 1927, a large percentage of it was used in the logging camps, by teams employed in logging. The dairy industries have expanded; logging operations have slackened off considerably, decreased. Therefore you have had decreased shipments by rail to Coos County, and perhaps the boat shipments into Coos County may have increased during the period which you have a record of.

These logging camps did not use more alfalfa hay than all the dairy interests down there. You (Mr. Dey) are not talking about 167 cars of alfalfa hay—you are talking about 167 cars of hay. I don't think that is alfalfa hay. I think that is all hay that you are speaking of there.

Q. Well, I will say 57 cars of hay of all classes.

A. You ask me how to explain the difference?

Q. Moved in there in the last year and eight months, whereas in 1924 there was 167 carloads moved in in one year; and isn't it a matter of fact that due to the advice that has been given by the Oregon Agricultural people to those people to raise their own hay, and the consumption of hay is actually falling off? (695.)

A. No; I don't think that is correct. I think that the substantial decrease is for the reason that I gave. In fact, we do, and always will, advise farmers to grow as much hay as possible, and you will find in the report of the Coos County economic conference, in which were represented a recommendation that they use their upland soils for the production of legume hay; that means clover or vetch, which is a good dairy feed. Well now——

Q. They have been doing that to an extent, but not enough to appreciably affect the hay importations. The valley lands, the bottom lands are valuable for pasture. The upland soil in
354 Coos County does not amount to ten per cent of the area. It is actually tilled and then planted and hay grown. The valley lands produce most of the hay that is produced in Coos County, and the very dairyman that wrote this report told me just a short time ago—that was the chairman or the manager of the Melowest Creamery—that they would like to ship in alfalfa hay in large quantities; that they would like to deal with these people, the producers over in Malheur County, if they could get this hay, releasing this land, or releasing hay land for pasture, and they would get a larger return as a result of doing it.

Q. All right; he may have told you that. I will accept your statement of that. But I want to know if it is your judgment (696) that the consumption of hay in Coos and Curry Counties dropped from 167 carloads in 1924 to 57 carloads over a period of a year and a half, because of cessation of use of hay in the logging camps where they feed a few horses, perhaps, or mules, or whatever stock they had there; is that your statement?

A. I think that is very largely the reason for——

Q. And is that the principal reason you account for this decrease?

A. For the decreased shipment of hay I wish you had the figures as to the classification, the amount of decrease in alfalfa that was actually shipped in.

Now the logging camps are still running over there to some extent. The big mills in the Coos Bay district are not running. They have not been running for quite a considerable period. The Stout mill was running in 1924; it is not running now. The business men in Coos Bay told me that their production there is greatly curtailed. The number of men they employ in logging camps is much less than it was in 1924. You can go down there and look at the city (697) and observe the same thing yourself, if you were there in 1924, as compared with 1927.

355 Sometimes they have quite a few head of stock around a large logging camp. The livestock used in the logging industry down there does not amount to a drop in the bucket compared to the dairy industry. Another point you have not taken into consideration is the amount that moves in by boat. Now it may more than offset the figures you have here; I don't know that and you don't either, but I am of the opinion that they did.

Q. Do you think that is going to stop when they begin shipping alfalfa hay from Malheur County, where it costs $7.11 a ton to produce it?

A. It depends on how cheap they can get it there. If they can get it cheaper from Malheur County they are going to get it from there.

Exam. ROGERS. I wasn't certain, Mr. Teutsch, just what tonnage you show for this so-called desert area, this area seventy-five miles square they have been talking about here. What do you allow for that in your estimate?

A. Well, that so-called desert area, Fort Rock Valley, is in (698) that section. The development—the potential tonnage which I have estimated as coming from the Fort Rock and Christmas Lake Valleys, will originate in this—you might say this: The tonnage in Lake County, Northern Klamath County, portions of Harney County, would all come for the so-called desert country.

Exam. ROGERS. What is that lake, northern Klamath and what else?

A. Harney.

Comr. MCMANAMY. Is that what is termed the high desert country?

A. Yes, sir.

Mr. MCCULLOCH. You said parts of Harney County, didn't you?

A. Yes; parts of Harney, the western part of Harney County.

Exam. ROGERS. And what you have said with respect to those three portions might be termed as being said as to the high desert, so-called?

356 A. Yes.

Q. (Exam. ROGERS.) What is your observation as to the percentage of irrigated lands generally that are being farmed or used?

A. The percentage of irrigated land generally that is being used now, it depends altogether, Mr. Examiner, on the district in which you are. Some of it 100 per cent. Now projects like the Ochoco, which have had financial difficulties, a small percentage (699), and the financial difficulty is the reason for it. Now the old projects that are sound, take the project there near Redmond in Deschutes County, there is an adequate water supply, adequate supply of cheap water, and practically 100 per cent is settled, reasonably good land.

Exam. ROGERS. What area has it?

A. And the old projects in Malheur the same way, 100 per cent. The Owyhee project, the old project there is 100 per cent sold and farmed.

Exam. ROGERS. What I was getting at is the point as to whether the supply, you might say, of irrigated land is such that even though more land is put under irrigation it won't be necessary to farm it in order to produce a crop?

A. It has to be—if the project is constructed it has to be put under irrigation. It will be put under irrigation, if it is economically sound. That is the question that determines that, the economies of the project. If crops can be produced there at a profit, it is going to be farmed and it is going to be settled. The thing about these new projects in Malheur County, there never has been in the history of irrigation precautions taken that have been taken on the Owyhee and on the Vale projects under Dr. Mead. Never before has the Reclamation Service, with some twenty years of experience behind it, weeded out of the total area of these projects all of the land that is poor land, only using the land that they (700) know can
357 be irrigated as assessable acreage. Now, with that as a basis you can expect a rapid settlement of those projects, because they do not have difficulties, the lack of the previous soil survey, that many of the other projects have been constructed under. Umatilla, for example.

Exam. ROGERS. You think these projects you have listed here will be utilized when they are ready?

A. There is no question about it at all in my opinion. I know that country. I know its productiveness. I know there are thousands of acres of land farmed, not producing economically as those lands will. That is the basis for any business—it is economy of production.

Exam. ROGERS. When Mr. Madden was on the stand there was some mention made of a duplication in his exhibit and yours. Will you straighten that out for us.

A. I believe I indicated at that time. I asked Mr. Madden the number of carloads which he originated on the Owyhee project, and that is in his exhibit. Do you have a copy of that exhibit here?

Mr. THOMPSON. 238 in five years, and 238 after five years.

The WITNESS. 238 carloads within five years and 238 after five years. That would be the only duplication. In other words, in my tonnage available within five years there would be that duplication there. From potential tonnage 238.

Mr. MCCULLOCH. Here is the page of his exhibit (showing (701) witness).

The WITNESS. Oh, yes; that is right.

Exam. ROGERS. In arriving at your estimates, Mr. Teutsch, did you use a uniform yield per acre for all the counties, or did that vary with the counties?

A. It varied with the counties, absolutely.

Q. (Exam. ROGERS.) Have you made any computations as to the number of people that would be required to carry into effect these estimates that you have given?

358 A. The number of people that would be required.

Exam. ROGERS. Yes.

A. Approximately so. There would be on the Owyhee 80,960 acres of new land. I figure an efficiently irrigated farm is a farm of about 80 acres, and that would be 1,012. I believe that is right isn't it, approximately 1,012 new settlers on the Owyhee alone? The Vale will be about in that same proportion, 80-acre farm—what was the total area of the Vale project? 24,000, wasn't it?

Mr. McCULLOCH. That is here.

The WITNESS. 24,780. Divide that by 80 and you will get the approximate number. 320 would be about it. It would be about 200 on the other projects in Malheur County.

Exam. ROGERS. Now that means, for example, for Vale 320 (702) farms?

A. That is it.

Exam. ROGERS. How many people do you allow to a farm?

A. Probably about four or five. That would be a farm family; you see, it will be a man, wife and probably on an average of five, probably.

Exam. ROGERS. What about the increased production in other counties outside of these irrigated lands and irrigation projects? Would there be an increase in population, if your estimates were realized?

A. Well, there would be an increase in the number of farms on these pumping projects, for instance. They will be put on a more sound economic basis. There should be more farmers on that 46,000 acres of land which will be irrigated from the Owyhee and pumping projects displaced. Now as to how many of that would be, would only be a guess as to the increase. I think there would be an increase but I don't know as to how much. There might
359 be a considerably larger number of families than what I have indicated only for each 80 acres, but I take that figure because our studies indicate that under Malheur conditions an 80-acre ranch is about the most efficient ranch.

Mr. DUNCAN. Mr. Examiner, may I ask a question right there in that connection? Isn't it true that the Reclamation Service, Mr. Teutsch, has established 80 acres as the farm unit size in those two projects, and will require its cultivation (703) in units not to exceed that?

A. Yes, that is right. They will permit 40-acre tracts—rather encourage 40-acre tracts.

Mr. DUNCAN. They will permit as much less than 80 as a farmer will take care of?

A. Yes.

Mr. DUNCAN. But not more than eighty?

Mr. McCULLOCH. Mr. Commissioner, I just wanted to request that the witness be given an opportunity to make some comment that he was interrupted in starting to make when Mr. Dey was questioning him about cost of producing alfalfa hay in different Oregon counties.

Comr. McMANAMY. He may make it.

The WITNESS. It was in explanation of Mr. Dey's point about the cost of yield. On page 11, Mr. Dey, of that cost study you will find a chart which shows the relation of yield of alfalfa hay to the cost of production, and as a result of that study listed in that chart you will see that a two-ton yield or under cost $12.46 a ton to produce;
360 that 2.9 tons (704) cost $9.73 per ton to produce; that a 7-ton yield, or over, cost but $5.86 to produce; and that is the point that I was making as to the yield in relation to cost, the reason why hay would come from Malheur County.

Mr. DEY. Why yes; but that does not answer the proposition that these people from your institution have stated that it cost so much to produce a ton of alfalfa hay in a particular county, does it?

A. No; they have taken, of course, the figures on the pumping units and all the other units.

Mr. DEY. They have taken into consideration, have they not, the formula you have just referred to, of course?

A. Yes, sir. (705.)

361 PORTLAND, OREGON, *August 7, 1928.*

J. P. NEWELL was thereupon produced as a witness on behalf of complainants and, having been first duly sworn, testified as follows:

Direct examination:

I live in Portland. I am a civil engineer. I have practiced my profession for forty-one years. I was three years regular student, Massachusetts Institute of Technology, and then for about twenty years in railroad work, both in the office and field, construction, location (707), maintenance. About fourteen years of that time I was in the employ of the Oregon-Washington Railroad & Navigation Company, and for the last three years of it I was division engineer in charge of maintenance of way of the Oregon lines of the Oregon-Washington Railroad & Navigation Company. Following that I went into private practice, and the large part of my time since that has been on valuation and rate work and studies of cost of service. I have been consulting engineer for the Oregon Public Service Commission since 1909, and I have engaged in valuations of all the railroads, all the important railroads, in the State of Oregon—the valuation of the Portland Railway Light & Power Company's property, and some smaller ones.

In 1918 I went to Toronto for the Canadian Dominion Government, and was on their staff in charge of the engineering work connected with the taking over the Canadian National Railroads; that was an arbitration as to the amount to pay for their stock. That, I think, required about five months.

In 1920 I was similarly employed by the Canadian Government in the taking over of the Grand Trunk and Grand Trunk Pacific, again an arbitration as to the value of the stock. I was there a year and four months on that work.

362 I have been engaged here in various rate cases. In 1919 (708) I made a study of the cost of service of the railroads from the inland empire to tidewater in connection with what is called the Columbia Basin differential case. I appeared again in that case in another controversy over that same rate in 1924, and have just completed testimony in it in the present case now being heard. I mean the grain rate investigation, I. C. C. 17000, part 7. I have, in connection with the cost of service on the lines here in Oregon and Washington, in the last nine years up to the present time, made and introduced in evidence before the commission in various proceedings three analyses of cost, but in the second one, in 1924, in the hearing held at Walla Walla, I didn't go very far into the matter. I simply took a former study and showed in what respects it might differ at that time.

I prepared and had received in evidence a comprehensive study and analysis of costs of moving wheat traffic in the Pacific Northwest for the grain rate investigation. (709.) I have just completed that work. I have prepared an independent analysis of cost of service and study covering other matters for use in this particular proceeding. I began it two years ago this past spring, about April or May. I haven't been at work continuously on it during that time, but I have put in the greater part of my time since that date. The underlying information and data for that cost study have been printed and embodied in pamphlet form for convenience of the commission and parties in this proceeding.

(Said pamphlet was thereupon marked for identification, "complainant's Exhibit No. 16, Witness Newell.") (710.)

On page three of the exhibit, in a note addressed to the Public Service Commission of Oregon, where I mentioned the Union
363 Pacific Railroad I meant by that the Union Pacific system, including the Oregon Short Line, Union Pacific proper, and the Oregon-Washington Railroad & Navigation Company. Turning to page 7 of my report: There are three objects that the public service commission had in petitioning for an order requiring the construction of a railroad from Crane to a connection with the main line of the (711) Southern Pacific, and they were to reduce the distance to eastern markets for a large part of western Oregon, to open up to settlement that territory in central Oregon which cannot be brought into use until it has rail service, and, third, the reduction of distance from southeastern Oregon and southwestern Idaho to Pacific coast markets.

It is not the intention of the Oregon commission to dictate as to the route, but in order that comparisons may be intelligible the figures presented here, first, are those based on the route selected by the Union Pacific at the former time when it itself was proposing to build the line across the State. If that line is built, it will shorten the distance from Eugene, which I take as a central point

for western Oregon, to Granger by 429 miles, as compared to the present route through Roseville. It will bring Burns, in central Oregon, 169 miles nearer to Portland, and Boise, Idaho, will have the distance to San Francisco shortened by 273 miles as compared with the present route through Ogden.

The differences in distance at Granger will apply equally to all points east of Granger on the lines of the Union Pacific system and its connections, because all movement would be through Granger by any of the routes under consideration. (712.) Through-
364 out my cost study I have used this point Granger. That is, either by Crane and the proposed line, or via Roseville and Ogden or via Alturas when and if the Alturas line is built. As to whether the Rogerson-Wells line of the Oregon Short Line, which has been built and put in operation since the previous hearing in this cross-State line case, has shortened in any way the distance from Boise that I just mentioned a minute ago to San Francisco, as compared with Ogden, would say that it offers a possible route from Boise which would be 183 miles shorter than the route commonly used through Ogden, and, therefore, as compared with that line the cross-State line would reduce the distance of Boise to San Francisco by 90 miles. I can't say what the Oregon commission had in mind in regard to a reduction in rates by reason of these shortened distances, but nothing which I have to present is based on any difference in rates in consequence of the shortening of lines. (713.)

There is a map at the back of this report which shows the distance. I believe, however, copies of that have already been introduced in evidence.

Now, the Southern Pacific proposes to build a hundred-mile link between Klamath Falls and Alturas, which would shorten the distance from Eugene to eastern points by 210 miles, and would have no effect on the other distances which have been named. A comparison, however, in this report is made with the Alturas line, as well as with the existing route. The first subject that I have investigated is a determination of the cost of the haul by each route under consideration, and I take the study (714) which I
365 presented to the commission in the hearing on docket 17000 of the cost of service in 1925 on the lines in Oregon of the Oregon-Washington Railroad & Navigation Company, supplemented by a similar analysis of cost on the Oregon Short Line, then by suitable modifications which I explain in detail I have worked out a set of unit costs to be applied to each road or district over which haul is to be calculated.

In my study of the cost of service on the Oregon-Washington Railroad & Navigation Company and the Oregon Short Line the statistics of 1925 were the latest available at the time I began the study. The crucial point in this case is the possibility of justly re-

quiring the Southern Pacific to interchange traffic originated by it in western Oregon with the Union Pacific at Crescent Lake. Freight destined for Union Pacific points is now hauled from Eugene through Roseville to Ogden, a distance of 1,194 miles. Building the Alturas connection would reduce that distance, but I take it for granted that the division of earnings would not be changed. The Southern Pacific, of course, gets a larger share of earnings on that basis than it would on interchange at Crescent Lake, which is only 96 miles from Eugene, but my calculations of the cost of haul by the different routes show that the saving which can be made on haul via Crane (715) will be sufficient when divided between the carriers to make interchange at Crescent Lake more profitable to both carriers than that at Ogden. (716.)

It is possible to make such a division of joint rates of the net earnings that the net earnings of the Southern Pacific on the short haul will be equal to what it could make on the long haul by way of Alturas and Ogden, and still leave enough for the Union Pacific
366 so that its net earnings per mile will be greater on the haul from Crane to Omaha than they are now on the haul from Ogden to Omaha.

And I then show that the traffic now moving between western Oregon and Union Pacific points, together with new business available in central Oregon and Idaho, are sufficient to make the proposed cross-State line profitable from the beginning.

I repeat here the cost of service which has been presented in the grain rate hearing, of the operations of the Oregon-Washington Railroad & Navigation Company on its lines in Oregon in 1925. What I am after there is to obtain a set of unit costs which may be applied to specific freight movements. I make an analysis of the actual expenses of the company, dividing them into classes, and then dividing classes into units of operation. I am continually considering the entire cost of the operation. Then after I obtain these unit costs I again take any given freight movement and find the number of unit operations involved in it and apply the appropriate cost to each, making allowance for departure from (717) the average conditions, if any such departures exist.

The unit costs are in costs of operations as averages of all the operations of the company.

The first thing that has to be done in any study of that nature is to separate out those expenses which are not affected by the volume of traffic, because they are a constant charge against the business of the road, whether it is large or small. I call those indirect expenses, while to those expenses which do vary with the traffic I call direct expenses.

367 Now, some expenses are affected by the variations in traffic in one unit and not by others. That is, the cost of trainmen is affected by the cost in train miles but it is not affected by the car miles in the train.

That statement is in general true. It is slightly in error as regards the State of Oregon, in which when trains exceed a certain number of cars an extra trainman is required.

I use the word "traffic" in this connection. It is understood to be measured in the unit applicable to the account under consideration, and the variations considered are in quantity only, without any change in car loading, train loading, or balance of traffic in opposite directions, or any of those characteristics which affect the total cost. I have to exclude those, because they would otherwise confuse the effect of variatioins in volume of traffic with the effects produced (718) by the changes in efficiency of the operations. I do not attempt to take into account my variatioins in traffic. Those are constantly possible without any paricular effect on expenses. You can put a few more tons of freight onto the same equipment and carry it at an additional cost that does not amount to anything, but if that is continued for any length of time and grows to any considerable volume it does affect the expenses. You have to put on additional equipment and facilities, and then there is a sudden jump in the cost of operation, and that ought not to be attributed entirely to the last addition to the freight traffic of the company. And before a change like that the operating cost per unit is less and afterwards it is more than normal, and I have attempted to keep away from those extremes.

368 There are certain operating expenses that are partly direct and partly indirect, because both natural causes and traffic affect them. That is particularly the case of maintenance of way expenses. There is going on at the same time wear caused by movement of trains over tracks, and the effect of natural causes, like decay and rust in their effect on the equipment and on the track. Now, the effect of those natural causes is not affected at all by traffic; it remains the same without regard to the volume of the traffic; but its ratio of course to the total expenses grows less as the traffic grows larger. (719.)

Then transportation expenses are partly indirect from another cause. When a railroad begins its operations it is necessary to put on a certain initial equipment so as to give service everywhere, regardless of whether the traffic amounts to anything or not, and for a time that equipment is only partly used, and as the traffic grows there is no particular change necessary in the amount of service or in the amount of equipment used, so that there is not any apparent effect on expenses. But when the time comes that those facilities are used up, then it becomes necessary—I mean when they are fully used it becomes necessary to add facilities as the traffic grows, so that after that the expenses on both the maintenance and the operation of that equipment would be fairly proportional to the traffic itself. So that, indirect transportation expenses would entirely disappear, if it were not for the fact that a growing system is constantly adding

portions of mileage in which these same conditions are repeated.

369 This necessity of providing additional facilities as business grows affects also the direct, the proportion of the maintenance expenses; for I think it is obvious that if the facilities themselves are made necessary by the growth of traffic, then their maintenance is also to be considered as made necessary by the traffic, and that is the reason that I put maintenance of tracks and yard tracks under the head of a direct expense. By this means of ascribing the expenses of (720) maintaining and operating partly used facilities and equipment to direct cost in proportion to the extent to which it is used and actually needed, I charge up to direct cost only the cost of maintaining and operating the equipment and facilities used to approximately normal capacity. I do not mean by that that each train is loaded with all it can carry, because there are constant fluctuations in the volume of business, and equipment and facilities must at all times be sufficient to take care of those fluctuations and must therefore always be a little in excess of the average requirements, but when the volume of traffic gets to be such that the excess of capacity over the average requirements is only enough to take care of the peak loads, I consider that this equipment is used to normal capacity and that further increase will call for more equipment.

Now in any consideration that takes up the matter of rates or of real net earnings or income, it is necessary of course to take in the indirect cost which I exclude from the direct cost, but it must come in the same manner as all overhead expenses, and the return on the investment; that is, it is simply to be carried by the entire volume of traffic and can not be ascribed directly to any particular traffic.

370 In estimating these direct and indirect proportions of operating expenses I go over the entire accounts one by one, taking them, however, sometimes in groups which are so related (721) that they can be considered all together. Many of those are obviously either direct or indirect wholly, or almost wholly, and others have to be estimated on the basis of judgment and experience. For a few of them, a very few, I have used a method that the American Railway Association recommends for comparing maintenance of way expenses. In general that consists in comparing the density of traffic and the expense per mile in the account under consideration on different roads and observing the extent to which the expenses of railroads on heavy traffic exceed that on light traffic, and for those I selected thirty American railroads, the majority of which are in the northern part of the United States and operate under conditions that make them fairly comparable to the Union and Southern Pacific. I have left out roads who were confined principally to freight or to passenger service. I have determined these relations over several years, but I do not compare one year with another,

because in doing that I might run into conditions due to rise or fall of wages, and other conditions, that might not be uniform through the different years. I have taken the volume of traffic and the expenses from the records of the Interstate Commerce Commission. (722.)

371 Well, in each case I divided these thirty railroads into two groups, putting those which had more than the average density in the one and those which had less than the average density, that is the average of the thirty below (723) it, and then I found the average expense per mile for each group. Then I assume that the difference in expense in the two groups is due to the difference in traffic density, and from that establish a relation between a given expense for a given amount of traffic and the percentage of it which would be due to the traffic itself. That part is merely mathematical. There is a formula here expressing it, but that is only a mathematical showing, and I think it is hardly necessary to go over it.

The only important accounts to which I have applied that method are track laying and surfacing, and the maintenance of station and office buildings. If I may I will go on and come back to that.

372 If you will turn to page 65 of that report (Exhibit 16a) (724) you will find a table for the year 1915. Now for the year 1915—by the way, I used here only 16 western roads. There seemed to be, on study of the report, such a difference between eastern and western roads for some reason, probably largely connected with wages, that it seemed several of the eastern roads were not in line with the western, and I used, therefore, only these 16 western roads for comparison. But you will notice there I have taken these roads and I have found the number of equipment ton-miles for mile of main tracks and arranged the roads in order of density. The first six have a density greater than the average of the 16, and the remaining ten have a density less than the average. And then I take the average—the amount of track laying and surfacing per mile for each of these roads. That is shown in the last column.

You notice then that the first six roads having a density represented by 5.48 spend an average of $367.00 per mile of track, while in the second group the density averaged 3.81 and the expenditure was $270.00.

Taking those group averages as indicating, therefore, the effect of traffic, I calculate for a given density the percentage of the total expense under that heading, which would normally be independent of the traffic, and the remainder of course being that which is

373 direct or variable with the traffic. (725.) The results obtained by study of different years in this way vary sometimes quite widely. Undoubtedly a consideration of one year alone would not be sufficient, especially in regard to maintenance of way expenses, because, as a general rule, a railroad company having a year of good business is likely to spend a greater amount on its

maintenance in the succeeding year than in the year in which the traffic is actually handled. So that it is necessary, in my opinion, to consider several years in order to get anything that is valuable as a guide in that line. I would not have used these figures exclusively, figured ratios obtained in this way, if I had any other guide, but in one or two cases there seems to be no other guide that I could get, and I have used figures obtained by the average of several years calculated in this manner.

Now, in order to apply that maintenance of way, I have used what the American Railway Engineering Association calls equivalent ton miles as a measure of the density of traffic. They estimate that the damage per-ton mile to track by passenger cars is twice that of freight cars, and the damage from locomotives twice that of cars, and therefore I multiply passenger locomotive ton miles by four, passenger car ton miles by two, freight locomotive ton miles by two, and add those to the gross ton miles of freight cars. That obtains an equivalent in tons of cars and freight in freight cars as the measure of the traffic passing over the road. (726.)

It was brought to my attention in the other hearing preceding this that this same association has made some slight modifications in these ratios, but they happen to apply only to locomotive—
374 to passenger equipment, and therefore would have but a very slight effect on these calculations as fas ar I have used them. I am referring to the manner of the use of that table on page 65. I was referring to what is stated in my exhibit (Exhibit 16) on page 12. That is, on page 12 I describe how I get a unit of traffic to measure density. Now, taking up these accounts one by one, superintendence, I simply divide on the same basis as the average of all other accounts under that head put together, superintendence on maintenance of way. For roadway maintenance it would appear from the classification that practically none of that would vary with the traffic, but, as a matter of fact, my study of the expenditures of the roads shows that there is a constant tendency to increase that expense as the business of a road increases. (727.) Using the tables, or tables similar to those which are given in the appendix [of Exhibit 16a], would show that the expenses of the Oregon-Washington Railroad & Navigation Company in 1915 and '16 would run about 45 per cent direct, and 1917 only about 10 per cent, and in 1924 it would run up to 70 per cent. I think that the reason that the expense grows with the traffic is simply in the fact that the roads as they have more traffic pay more attention to the appearance of their right of way, keep their posts and signs and such things, and fences, painted better, and line up the edges of their ballast, trim it up, give it a neater appearance, and pile up stones around posts and whitewash them, and do various things of that kind, the expenses of which run to quite a little money and which are not an
375 actual necessity at all as regards traffic. (728.) I think it is proper to treat that as though it were a real necessity, but in

this case we are dealing with roads of lower traffic density than the average of those under consideration and through a rough country, and, therefore, I think it is sufficient in this case to attribute ten per cent of this account to direct. That figure, you see, is not derived from these other calculations.

Bridges, trestles, and culverts: No comparison of one road to another could indicate anything, because of the variety and extent of such structures. I merely present my own estimate that for the Oregon-Washington Railroad and Navigation Company the maintenance of those structures would amount to 25 per cent—that 25 per cent of the maintenance of those structures would be caused by the effects due to traffic, as distinguished from natural causes.

In ties, also, comparison of one road with another doesn't give much of a guide, because of the wide variations in the character of ties and cost of them in different parts of the country. I estimate that the effect of wear on the main track of the main line add 30 per cent of the maintenance and on branch lines I consider it negligible. It would exist in smaller quantity, perhaps, on the heavier traffic branch lines, but in any case it is a very small matter. On side tracks in yards and commercial tracks I consider that all direct, because, I have already stated, I think those tracks themselves are (729) there because of the traffic and are there in proportion to the traffic, therefore, their maintenance is proportional with the traffic.

There is an apportionment of these tracks on page 19, and when I come to that I will show how I get 24 per cent of that
376 entire account as direct.

Rails, other track material, I consider that the entire expense for maintenance is due to traffic, none to natural causes.

Now, on ballast, if I take eastern roads as a group and study them in the manner indicated by the tables in the appendix I get a figure of 56 to 60 per cent as the effect of traffic, but on western roads, treating them in the same way, it would appear that the ballasting expense increases faster than the traffic. That is due to the fact that the roads of low traffic density are likely to have considerable lightly ballasted track, and its maintenance perhaps costs more than that of the heavily ballasted track, even with heavy traffic, but deterioration of ballast undoubtedly takes place in some degree from natural causes, and for the roads under consideration here, the Oregon-Washington Railroad & Navigation Company first, I estimate at 50 per cent of the expense.

In tracklaying and surfacing: In this account I can find no better guide than that indicated by a study and comparison with the other roads, the sixteen western roads, and taking the (730) average of the four years 1915, 1916, 1917, and 1924 I find an average of 64 per cent direct as the figure which I apply to that account.

For station and office buildings the extent to which their maintenance is due to traffic is another that is very hard to estimate. For

a comparison on the basis of traffic I took the tons originated per mile of road. The reports of the Interstate Commerce Commission do not separate these accounts between freight and passenger,
377 but I find some figures covering the eastern districts and the western districts for 1916 which show the expenses apportioned to freight. They were, for the eastern districts, $56.00 a mile, for the western roads they were $20.90 a mile, while the tons originated on the eastern roads were 9,800 per mile, on the western 3,000 per mile.

Working this out mathematically would indicate that for the Oregon lines, with the number of tons originated 2,000 per mile, if that were strictly in line with these others in its fuel expense it would give us 65 per cent direct expense, and since that seems to me in my own judgment a reasonable figure I have used it for structures on the Oregon-Washington Railroad and Navigation Company.

Water stations show quite regular records for the effect of traffic on the basis of locomotive miles per mile of road as the unit of traffic density. They would indicate that for the (731) Oregon-Washington Railroad and Navigation Company about eight per cent of that expense was in accordance with traffic.

For fuel stations they are irregular, with the average a little over 50 per cent, and I have used that ratio.

Shops and engine houses: I have tables in the appendix showing the relation of that expense to traffic, and I have estimated it from these calculations for several years as 80 per cent direct.

Telegraph telephone lines: I estimate half of those repairs due to use.

Signals and interlockers: Half of it proportion to the traffic.

Then such accounts as expenses, crossings, and signs, wharves and docks, paving, removing snow, ice, and sand, assessments
378 for public improvements, tunnels, and subways, are not related to traffic at all; they are entirely indirect.

And certain other minor accounts are apportioned simply on the basis of the average of all the other accounts. They are such accounts as stationery and printing, and others of that nature, small tools and supplies, and the like.

And joint tracks and yards: I consider that the charges there are based on the proportions of traffic use of the carriers using them, and, therefore, that would be a direct expense.

My conclusion as to maintenance of way and structures, expenses (732) I use as direct and indirect, would say that if you will turn to page 26, you will find where these are all gathered together in the table. I will comment on that right now because it would be advantageous to do it. When these are added up I get a figure of practically 50 per cent direct on the maintenance of way, almost exactly 50 per cent. Maintenance of equipment, I consider that as an entire group as being entirely direct, 100 per cent.

Traffic is a small portion of the total expense. There are outside agencies. Their expense would, in the main, I think, be affected somewhat by the amount of traffic, although it would be rather a round-about method of getting at it, because the expense would be incurred and the traffic might result at a considerably later time, but I have estimated that at 50 per cent direct.

Membership in traffic associations, and expenses of that kind, I have considered entirely indirect.

The expense of industrial and immigration bureaus, the same as outside agencies, 50 per cent direct.

379 Now, under transportation expenses, that group would be entirely a direct expense if it were not for branch lines on (733) which the traffic is below the capacity of minimum service that has to be provided.

At the beginning of operations every district has to have service that is governed by the needs of the public, rather than by the actual traffic which is there, and the public is served with a small number of short trains, and the growth of traffic at first then consists simply in adding on cars. It doesn't affect the number of trains, and it doesn't affect expenses which are dependent on train mileage. There are certain other accounts, like yard expenses, which vary chiefly according to the car mileage, so that whenever traffic grows so that it means more cars, then these expenses become wholly direct.

Fuel and water supplies for the locomotives are a little increased, but not in proportion to traffic, by that growth of traffic which can be cared for by simply adding cars to the train, so that these accounts do not become wholly direct—do not come to be in the exact proportion to traffic until it becomes necessary to put on increased trains as well as more cars.

There are two classes of freight trains for my purpose—through freight trains on the main line—I consider that those are not sent out until tonnage is on hand to make up full trains, so that their expenses are all direct. (734.)

And the way freights and mixed trains constitute the whole service on many branches, and sometimes a part of it on the main line. The way freight service on the main line I consider

380 100 per cent direct although the traffic per train is less, and the expense, therefore, greater per ton than that of the through train, it is a necessary part of the service, and it is fair to assume that the trains as a run are as heavy as service of that nature will permit. Their business is that of picking up and discharging freight along the district, and they do that going in both directions, both picking up and discharging as they move in either direction. But on a branch-line train it does practically all of its unloading while it is moving away from the main line and its picking up while it is coming back, and, therefore, it is not possible for a branch line way freight to handle as many cars as a main line way freight.

I estimate that these branch lines on the Oregon-Washington Railroad and Navigation Company carried a half of this lesser capacity, and, therefore, put their service down at 50 per cent direct.

This does not apply to train mile unit costs, for those would be almost the same with short trains as with long ones, and so in order to overcome that mathematical difficulty of treating expenses directly—entirely direct for one unit and partly so for another, I have considered it as partly (735) direct and then correct it as regards train miles by reducing correspondingly the number of train miles when I come to divide the total train mile costs by the number of train miles. That will be explained further later.

The main line train miles of the Oregon-Washington Railroad & Navigation Company in Oregon amounted to 1,056,048, and
381 those of branch lines 280,337. Taking the latter at one-half the value of the others reduces it to 140,118, with a total of 1,196,166, and that is 90 per cent of the total number of train miles actually run. So I consider that the train service of the Oregon-Washington Railroad & Navigation Company in Oregon was 90 per cent direct.

Dispatching train I consider entirely a 100 per cent direct account.

Station employees are calculated in the same way as I have explained for maintenance of stations. I found that in 1916 on the eastern roads the expenses in proportion—the expense of station employees seemed to increase in practically exact proportion to the density of the traffic as measured in tons originated per mile of road. That is on 1916. A similar comparison in 1924 showed them increasing somewhat faster than the traffic itself, but I don't think that could be true of roads in this country, which have to traverse more or less sparsely settled country, where there are a good many employees kept merely from the necessity of giving service to the public (736), and who in their various capacities handle a very much larger amount of traffic than they do, so that an increase of traffic spread uniformly over the entire system in the same proportions would not increase expenses in those districts. So that for my purpose here I estimate that this expense on the Oregon-Washington Railroad & Navigation Company is 85 per cent direct.

I take the same figures for station supplies and expenses, the same proportion as station employees.

Weighing and inspection and the like I consider entirely proportional to the traffic, and, therefore, direct.

The yard expenses, the same.

382 Train enginemen I take as 90 per cent direct, as calculated for the train service of the road.

Fuel for train locomotives isn't as much affected by branch train service as the enginemen.

I find that the records of the company for freight train performance show that the amount of fuel used on branch line trains is about 25 per cent more per thousand gross ton miles than on the main line,

and that excess is equivalent to about two per cent of the entire train fuel account, and I therefore make that account 98 per cent direct.

Engine-house expense—train and trainmen, are made 90 per cent direct, for the same reasons as for train and enginemen. (737.)

Train supplies and expenses I consider entirely direct.

Signal crossings and drawbridge operations, entirely indirect, not affected by traffic. (738.)

Certain other accounts here, like telephone and telegraph lines, direct operation; stationery and printing, insurance, injuries, on the basis of the average of all other accounts under transportation.

Clearing wrecks, damage to property, damage to livestock, loss, and damage, in exact proportion to the traffic, or one hundred per cent direct.

Joint yards and terminals I apportion on the basis of the average of accounts 373, station employees, and 376, station supplies and expenses, and 377–89, yard expenses. Superintendent and joint tracks and facilities I apportion on the basis of the average of all accounts under the same.

383 The last general subdivision of transportation expenses is numbered 4 on page 15, the next subdivision, entitled general expenses, on page 17, is numbered 8. It ought to be No. 7. Five is expenses of water transportation, which have nothing to do with anything we are considering here; and 6 contains certain miscellaneous expenses, chiefly passenger service, such as maintenance of dining cars, and accounts of that kind. So I left those out entirely. (739.) Now, if you will turn over to Table 1 on pages 26 to 29, and consider only the first half, that is, on pages 26 and 28, you will find there where these percentages have been applied to each of these groups of account, and the result is applied to the entire freight expenses indicated.

The passenger and freight expenses in the first two columns are taken from the annual report.

I deal here only with the freight expenses, and they are divided according to my analysis in the two succeeding columns, the percentages, the resulting amounts of money being indicated there. They show that maintenance of way, practically fifty per cent direct, maintenance of equipment put down at one hundred, transportation, rail line I find to be 94 per cent direct, and the average of all expenses 84 per cent, direct, 16 per cent indirect.

Having now the direct freight expenses, those which are affected proportionally to the traffic, so that we might expect that this analysis is accurate, that ten per cent greater traffic would have shown ten per cent larger amount of direct cost, I want to

384 divide those so they can be split up among the units of operations for the purpose of enabling me to allocate these costs to particular districts, which vary in grades and curvature and conditions, sometimes, under which (740) they are operated. For the purpose of doing that, I divide this direct cost first into two

classes, the terminal cost, which has to do entirely with the origination and delivery of traffic; without any regard to the distance which—I am testifying now with respect to page eighteen of my study, and that again is divided into two classes, carload and less than carload.

Less than carload, so far as moved in cars, is considered as a part of the carload, the less than carload figures being intended to cover only expenses apart from the movement of the stuff and the handling of the freight in carloads.

And then there is the road cost, or the expense of moving freight between the points of origination and delivery. That is made up of two factors: First, distance factors, which depend upon the distance that the freight is moved, that is, on mileage; and resistance, or costs which depend upon the resistance that is to be overcome on account of friction and grades.

The unit for terminal carload operations is taken as the terminal handling required for delivery of a car to a consignee.

The unit of less than carload operations, the terminal handling of a net ton. (741.)

385 Distance factors are divided—the distance factor is divided into three units, the train-mile, the car-mile, and the gross ton-mile; and the unit of resistance is the resistance equivalent to that of lifting one ton one foot, or of one foot-ton.

Now, what I do here is to proceed to divide these freight expenses into classes in accordance with those which vary according to these different units. I then find the total number of those unit operations, total number of ton-miles, car-miles, and so forth, in the entire operations of the company for the year, and divide each cost by the number of units, and obtain a unit cost; then for specific movements of freight I find the required number of train-miles, car-miles, foot-tons of resistance to be overcome, gross ton-miles handled, and apply the unit costs thus found to that movement.

Taking up the maintenance of way first, and dealing from this on only with the direct cost as indicated in Table 1, leaving the indirect cost out of any further consideration for the present, I take my track accounts and consider that main tracks and passing tracks are used for train movements, so that their maintenance is entirely a road expense, while commercial and industrial car tracks are used only for terminal purposes, but yard tracks are used both for (742) origination of freight and for the assembling of cars in trains, which is terminal; and for operations connected with the movement of trains from one division to another, which is a road expense.

From comparison of the yard expenses on the first division which has a large amount of origination and a comparatively
386 small amount of through movement, with those on the second division, where the expenses are chiefly for through movement, I estimate that these expenses for the lines in the State should be apportioned sixty per cent to terminal carload, and forty per cent

to distance car-mile, and I divide my yard maintenance expenses in that proportion.

I have mentioned the first division and the second division. I will explain what they are on the Oregon-Washington Railroad & Navigation Company in Oregon. The first division in Oregon extends from Portland to Umatilla, along the Columbia River. It includes all the Portland yards and terminals here, and the comparatively level, or very nearly level, track from Portland to Umatilla.

The second division extends from Umatilla, and also by another line from Messner, on the main line, across to Huntington, takes in all the mountainous parts of the Oregon-Washington Railroad & Navigation Company. (743.)

As to why I used the Oregon-Washington Railroad & Navigation Company for the basis of this study as compared with the Short Line, or Southern Pacific, would say that in the first place, I had made a study of the Oregon-Washington Railroad & Navigation Company for a previous case of the original Columbia River differential case, and a further reason for that was that I was familiar with that road from having worked upon it for a long time, so that I knew its physical conditions much better than I did that of any other road and the effect of those upon operating conditions. Then as a matter of study from a scientific standpoint it was easier
387 for me to work on that road for these reasons than it would be upon a foreign road, one with which I was not acquainted.

In this study, however, I follow a similar study of the Short Line, and the O. W. actual conditions are under consideration here in some part, and those of the Short Line very much and of the Southern Pacific I make some comparisons which I think justify the extension of the unit of costs found on the other roads to operations on that road. This is a substitute for a similar study made there. Lack of time, for one thing, to cover the entire ground prevented me from making that kind of a study as regards the Southern Pacific. (744.)

I show next in my report, on pages 18 and 19, the classification of the main and branch lines of the Oregon-Washington Railroad & Navigation Company in Oregon, and further classified them as to main tracks, passing tracks, yard tracks, commercial tracks and industrial tracks.

I will go on with roadway maintenance. The small proportion of roadway maintenance that I have considered as direct I have apportioned on the average of all track accounts under maintenance of way.

On bridges, trestles, and culverts, so small a proportion of that account would apply to any yard tracks or sidings that I have calculated it entirely and considered it as altogether a road expense, and for that portion of it which is affected by traffic I divide on the basis of the equivalent ton mileage from the Oregon lines attributable to freight movement.

That was shown back here on page twelve, and considering
388 only the gross ton miles and the freight locomotive ton miles I find that twenty-three per cent of this was made up of locomotive movement and seventy-seven per cent of freight car movement. Now, it is the freight cars which provide the gross ton miles, so I take seventy-seven per cent of that (745) account as the gross ton-mile account, and the locomotives are used on account of resistance to movement, and I have therefore put the remaining twenty-three per cent in as a resistance cost.

Under ties, my purpose is to find out what proportion of the direct tie maintenance would be found on main and passing tracks, and what proportion on yard and commercial tracks. I have weighted these in accordance with some opinions of the American Railway Engineering Association to the effect that—I see that in my type in the text there is an error, including main tracks in the first statement. The statement ought to read, "The maintenance of ties for sidings," is considered as one-half that of main tracks. I would like to eliminate the words "main tracks and" in the first line of that paragraph under 212. I haven't had time to proofread this. It was just received from the printer. And I myself estimate the passing tracks would lie between those ratios, making it three-fourths as muc .

Now, this other was a mere mathematical calculation, and I presume it is hardly worth while to stop to go over it, but from the result of that I find that the direct maintenance of ties amounts—is equivalent in mileage to twenty-four per cent of the total amount of 1,137, and it is there that I obtain my twenty-four per cent direct.

389 Now, then, considering that the maintenance of yard (746) tracks is all terminal—is sixty per cent terminal and forty per cent car mile, and that all the maintenance on the commercial tracks is a terminal expense, and that the remaining sixty per cent is to be divided between resistance and gross ton-mile in proportion to equivalent ton mileage, as was done with bridges and culverts, I get finally a figure of thirteen per cent terminal, carload, eight per cent car-mile, forty-six per cent gross ton-mile, and fourteen per cent resistance as the division of the direct tie maintenance expense.

When I say as the division I mean as the division between the different unit costs that I have employed in this study, between the different units of operation.

On rails, rail maintenance, the American Railway Engineering Association estimates that yard tracks and commercial tracks require only a fourth as much as main tracks, and I introduce also the figure of half as much for passing tracks, and proceed with a similar weighting and division based on the same reasoning as in the preceding cases, which gives me terminal, carload expense of four per cent, car-mile one per cent, resistance twenty-two, and gross-ton-mile seventy-three.

Other track material, divided similarly, and sufficiently (747) indicated, I think, in the text, without reading it.

Ballast, likewise.

Also for tracklaying and surfacing.

I will omit going over those, unless someone wishes that I should do it.

Maintenance of station and office buildings is divided the same as station employees, and I will leave that until I come to that account.

390 Roadway buildings. The average of all accounts under maintenance of way.

Water and fuel stations are divided according to fuel accounts, and the figures are set down here by which these percentages are worked out.

The maintenance of shops and engine houses I take on the basis of the allocation to unit operations of certain other accounts; that is, maintenance of equipment, of engine-house expense, both train and yard, and the figures are set down and the method of working them out indicated.

Telegraph and telephone lines I divide equally between train-mile and car-mile.

Signals and interlockers upon the basis of the equivalent ton-miles, and the accounts as indicated here are taken simply as the average of all accounts under maintenance of way.

Coming now to maintenance of equipment, I apportion the (748) locomotive repairs, freight, to resistance according to the freight train locomotive mileage, including mixed trains. That is set forth here, and it will be observed that the freight locomotive miles plus the mixed train locomotive miles are 65 per cent of the total of two and a half million. I therefore take 65 per cent of this account as applying to resistance, being a road mileage expense, and in proportion to the resistance which the locomotives must overcome. The others I divided between terminal and car-mile, as indicated here in the text.

Under freight-car repairs, these come from such a variety of causes, and I have found so much difference in the opinion of practical men on the subject that I have had to estimate
391 this to a considerable extent from my own judgment, and I estimate that on this road 15 per cent of the car repairs would be due to damages in switching in the yards, and I divide that up nine per cent terminal, and six per cent is due to the handling of through cars, and therefore a car-mile expense. Of the 85 per cent incurred in road handling I estimate 20 per cent due to damages in starting and stopping trains, and therefore a car-mile expense, and 45 per cent to resistance, because it occurs on grades and curvatures. The remaining 20 per cent is miscellaneous causes chargeable to car-mile, so that the net result dividing this account is terminal, carload, 9 per cent, car-mile 46 per cent, and

the (749) resistance 45; and the balance of the accounts under maintenance of equipment are apportioned simply according to the average of those already described.

Traffic: Everything under this head is terminal, and I have apportioned it 20 per cent to less than carload and 80 per cent to carload.

Then I come to transportation expenses:

Dispatching trains, entirely a train-mile expense.

Station employees: The greater part of these employees are engaged in terminal operations, but there are telegraph operators and men engaged in feeding and watering stock, and straightening and reloading shipments, and doing various work in connection with through business and accounting for it. I estimate those at ten per cent of the whole account, and divide them equally between train-mile and car-mile. Of the remaining 90 per cent, the greater part belongs to the l. c. l. business, so that I take 70 per cent to that
392 and 20 per cent to those expenses which have to do with carload.

Weighing, inspection, and demurrage is a small account. I estimate it 25 per cent less than carload, and 75 per cent carload, all terminal.

Station supplies and expenses I divide the same as station employees. (750.)

Yard expenses, for reasons already described on page 18, are divided 60 per cent to terminal expenses by the carload and 40 per cent car mile expenses.

The train enginemen is an account requiring considerable analysis to determine to what extent it is proportional to train mileage and how far it is affected by other causes. Primarily it varies according to train mileage, but it is affected by resistance, so far as grades require the use of assistant engines or require the use of heavier engines whose crews are paid higher wages or have the effect of reducing speed so that men are paid on time instead of mileage. The figures shown here for the three divisions of main line freight train performance indicate the effect of these factors combined.

Division 3 extends from Umatilla and Pendleton to points on the main line northward and eastward throughout eastern Washington. In general, it is a line of moderate grades, somewhat heavier than the grades of the first division, not nearly so heavy on the average as those of the second division. I will point out, without reading all of these figures, enough to indicate the comparison that I wish to make between the divisions. The first group there merely points out physical characteristics (751) and facts regarding speed,
393 train loading, and so on. The grades are indicated under the head of equivalent rise per mile in feet.

I had better say right here that equivalent rise is a factor made up of the effects of friction as expressed in grade and the actual grades and the characteristics of the three divisions in that respect

are shown by these figures which apply only to the main line, do not include the branches. The first division has an average in both directions of 17.2 feet, the second division of 30.7, and the third 18.2 feet.

Now in the second tabulation at the bottom of page 22 it is shown that the expenses of enginemen are 23.75 cents a train mile on the first division, 50.25 on the second, and 32.28 on the third.

The controlling factor in those variations is attributable to the effect of grades on resistance. There may be some other factors entering into it in a small degree which I am unable to detect or measure.

It is my assumption here for the purpose of this discussion that they are entirely due to the heavier grades of the second division. You will note that the first and third have almost exactly the same figures, although it is true that the third, with slightly greater resistance, has a very slightly less (752) expense per train mile, showing that there are some factors affecting it slightly other than grades.

Now from these comparisons I have worked out estimates of the effect of grades in increasing the cost of enginemen, and by the amount that I find that that cost exceeds what it would be on a straight mileage basis, on moderate or level grades, I attribute
394 that proportion of this expense of train enginemen to resistance, the remaining portion being considered as proportional to train mileage. Is it desirable that I go through those calculations here? They occupy a page here. And my net result is to estimate that 40 per cent of train enginemen expense on the Oregon lines made up mostly of second division and first division, is attributable to resistance, and 60 per cent is proportional to train mileage.

I think the figures can be readily followed by anyone who wishes to go through them. Now, of that 60 per cent which is not chargeable to resistance, a small proportion is due to other causes than train milage. I find from study of the compensation of trainmen that those who are on local and way freight trains make 76 per cent as many miles actually run per hour as those right through on the trains, and I would attribute this to the time spent at stations in handling freight and to the delays due to the inferior class of trains. This is terminal expense, and enginemen must have been affected in (753) the same degree as trainmen. From that calculation—from that consideration I apportion 9 per cent of the time of enginemen to terminal carload and 3 per cent to the handling of less than carload freight, and the remaining 48 per cent of train-mile expense, having already put 40 per cent to resistance, fuel for train locomotives, all due to the overcoming of resistance, except what is used in train switching. Now, the mileage of the latter was 5.3 per cent of the total freight locomotive mileage, but I estimate that the percentage of fuel would not be over three per cent, and I therefore apportion 3 per cent of it to terminal expense, and 97 per cent

to resistance; and water and lubricants and other supplies
395 apportioned the same as fuel; and also engine house expenses.

In trainmen that expense is not quite so definitely indicated as in the case of enginemen, but the effect of heavier grades on that expense is quite clearly indicated; that is, that there is such an effect. And in a manner similar to that which I have used for enginemen I work out calculations of the effect of grades in producing trainmen cost and assign 13 per cent of it to resistance.

That effect of grades on cost of trainmen is indicated by those figures of 32.2 cents for the first division, 43.77 cents per mile for the second division, and 36.31 cents for the third division. (754) As to how I divided among our different units of operation the direct cost for trainmen, in what percentages, I arrived at this figure after considering the difference in their compensation for local and way service: Terminal carload 7 per cent, less than carload 7 per cent, train-mile 73, and resistance 13 per cent. It will be found that this division of direct terminal and road cost between our different units of operation will, if the respective percentages are added up for every particular account, in every instance amount to 100. The entire amount is kept continually in sight. The effect of error of judgment in these apportionments would result in some one unit, perhaps one unit cost being found a little larger than it ought to be, and some other one or all others slightly less, and in the application of those to specific movements of freight it would result in perhaps a movement, let us say, on heavy grades being found to be slightly less than it ought to be, and correspond-
396 ing movements on light grades therefore being a little more than they ought to be, or the reverse. But in all cases all of the units to which the costs are applied would appear in varying amounts. Under my method certain elements of cost (755) would not disappear. They might not be accurately distributed in their proper places. But they are all there somewhere in one of the percentages.

I am down to train supplies and expenses, 402. I estimate 15 per cent of that account is terminal, 10 per cent train-mile, and the balance a car-mile expense. In clearing up the wrecks, accidents that were due to defective grades, would be proportional to car mileage, and those due to defective tracks directly to car mileage, go to a greater extent to train-mile, and those due to external cost would be proportional to the train-mile. I estimate out of that combination 60 per cent might be attributed to train-mile and 40 per cent to car-mile expenses.

Damage to livestock would be a train-mile expense. Damage to freight would be partly terminal and partly car-mile, and partly train-mile. I have put it this way here: 40 per cent less than carload, 10 per cent carload, 30 per cent train-mile and 20 per cent car-mile expense.

Joint yards and terminals are divided the same as the total of accounts 373, which is station employes, and 376 to 389, which are yard expenses. Then there is a group of expenses, of accounts here mostly small, which are divided according to all other accounts under the head of transportation. (756.) Then general expenses finally are apportioned the same as the total of all other expenses.

All of these apportionments and allocations are combined
397 in Table 1. On page 26 and through page 29, those four pages constitute my Table 1. The figures shown in the first columns headed passenger and freight, on page 26, are taken from the annual report of the company to the Public Service Commission of Oregon. That is true also of the first two columns of figures on page 28. On page 26 there are four columns of figures under the caption freight, and then there are subcolumns per cent, direct, per cent, indirect. The figures in those four columns computations were made by me. The method I followed in obtaining these percentages of direct and indirect expense have already been covered in my explanation. On page 27 I have similarly made computations to (757) derive all the figures shown on that page. The same is correct as to page 29. I did not make the computations on page 26, showing the separation between passenger and freight in the first two columns. That was done by the carrier.

On page 27 I have undertaken a further subanalysis of the direct freight cost figure shown on page 26. On the first line I have computed that of the O.-W. R. & N.'s operating expenses for 1925 $89,100 was attributable to superintendence of maintenance of way and structures as a direct expense. On page 27, on the first line of figures I have segregated or further analyzed this figure of $89,100 as a direct freight expense into six different elements. (758.) One, the terminal less than carload expense; the second, the terminal carload expense; the third, train-mile; the fourth, car-mile; the fifth, gross ton-mile, and the sixth, resistance. If those six figures

on that top line on page 27 are added it will produce $89,100.
398 I have not estimated here in my cost study any further analysis or separation of the figure of $89,000 on page 26, the top line for indirect freight expense. The six subcaptions on page 27, that is terminal less carload, terminal carload, train-mile, car-mile, gross ton-mile and resistance, are the six units of operation for which I have determined average costs in this study. They are average direct costs. The other figures for the other accounts shown on pages 26 and 28 are computed in exactly the same way as I have explained for the first line. (759.) I think Table 1 is fully covered. I have shown here indirect freight cost. Previously my cost study here does not undertake to go any further than to ascertain the direct cost. That is all I am dealing with in comparing different routes one with another. When I have come finally to the earnings possible for the cross-State line I have to take into account indirect cost, as attributable to that. But up to this point,

and for the purpose of this Table 1, I have not attempted to further subdivide this indirect cost or to apportion it in any way. But my use or application of indirect cost will be developed and explained later on in my testimony. I have not seen the study as to whether the commission in making settlements under section 209 of the transportation act made a somewhat similar study and analysis of what I term direct and indirect expense here, or that they arrived at one-third direct expense, say, for the maintenance of way and (760) structures, and two-thirds indirect as against our 50 per cent. I would say this, however: That the percentage which is direct is itself variable with the volume of traffic of the carrier under consideration. It can't be dissociated from the volume
399 of traffic. And that comparison would not, therefore, be an intelligent one unless it took into account the volume of traffic of this carrier here and—was this for a group of roads that you speak of? You think it was for all class one roads. I don't know how that traffic would compare with the density here, but that would have to be taken into consideration. In Table 1 on page 26, for item 201 I have allocated 50 per cent of the freight cost as a direct expense and 50 per cent as indirect, adding 50 and 50 making 100. In other words, the direct and indirect cost that I have allocated will make up 100 per cent of the freight cost attributable to that particular account. It is true that for some of these accounts I have (761) found the indirect cost—take 206, for example, the indirect cost 100 per cent, and no direct cost. On the other hand, in some instances, like 214, I have found that the direct cost was 100 per cent and there was no indirect cost. In every account it will be found that the sum of the percentages in the two columns headed freight will add up 100. Those percentages in the respective columns are my own computations, and I take them on the basis of the explanation I have previously made.

Now taking up page 30. On page 30, there are certain portions of the investment in railroad property that increase approximately in proportion to the increase in traffic. The property items are equipment (762), and sidetracks, and buildings. The interest on those is, therefore, properly a part of the direct cost of service. I have calculated it at the rate of 5 per cent, and in the figures which follow these are statements of the manner in which I derive
400 my estimates of the investment in various items, locomotives, cars, sidetracks, and buildings of various kinds, to which these figures, this interest charge, is to be applied; and I think it would be unnecessary to spend any time in reading that.

The interest on investment in train locomotives I charge up to resistance; that on switching locomotives, divided the same as yard expenses, 60 per cent to the carload and 40 to the car-mile; interest on freight cars, I apportioned on an estimate of the time consumed in loading and unloading and called it 60 per cent carload and 40

per cent car-mile; miscellaneous equipment I apportioned on an estimate of other equipment. As to the figures on page 30, under the heading investment in equipment, steam locomotives to June 30th, 1914, $2,269,000, that was taken from the company's annual reports which I had used in my original cost studies, because they were in convenient form for me to use, and also because the annual reports used that date. (763.) I have added to the investment as of that date the investment since and shown in the third column the totals for those four classifications of investment. So that the totals in column three represent the figures as of 1925. Now going on with sidetracks, on page 31. Sidetracks I estimate on a mileage basis, so much per mile, and the interest on passing tracks I consider is a train-mile expense, and of the other tracks, yard tracks, 40 per cent to car-mile expense on account of the through movement of the cars and the balance to terminal carload.

Station and office buildings, I divide the interest on those in the same manner as station employes, 70 per cent to the less than
401 car-load, 20 per cent to the car load, 5 per cent to the train-mile and 5 per cent to car-mile.

Investment in shops and engine houses: Interest is apportioned in the same manner as to maintenance.

On fuel stations the interest is apportioned on the basis of consumption of fuel, 85 per cent to resistance on account of train fuel, and 15 per cent to yard work, which is divided 9 per cent to terminal and 6 per cent to the car-mile.

Water stations are similarly divided.

Then I have included also the hire of equipment, as found (764) in the company's annual report, and these figures are collected in Table 2, on page 33, where the first column gives the estimated investment, the next 5 per cent interest on it, and the remaining columns the allocation to the different groups of unit expenses. The figures on page 33, with the exception of those in the first column, are my own computations. And even those in the first column are partly my own computations as derived from the annual reports and with the application of percentages to bring them approximately to present-day costs.

In the columns under the caption "Direct freight," on the right-hand side of the page, I have shown again in this partial analysis of investment my terminal and road direct freight costs, and have subdivided the terminal into less than carload and carload, and the road costs into train-mile, car-mile, and resistance, again using all of my units of operation for that purpose, except the gross ton-mile.

These allocations of interest on investment, so far as the
402 percentages shown, make up for each item 100 per cent, when the different percentages on any one line are added together. In some instances, for example on the first line (765), 100 per cent of interest on investment, I have allocated to road cost and none

at all to terminal. In all the other instances on that page the interest is divided as between terminal, on the one hand, and road cost on the other.

Going to the next page. I come now to the collection of the statistics to determine the number of unit operations to which the preceding cost figures are applicable, and these have been gathered together in Table 3, on page 37, the first nine columns of which have been taken from the company's records, except that on certain districts which are cut off by the State line, such as from Umatilla to Ayer Junction, Pendleton to the State line—that is part of the district Pendleton to Grange City; on those I have had to make some estimates and apportionments in order to bring the totals into conformity with the totals of train-miles, locomotive-miles, and so forth, reported by the carrier to the public service commission as confined to operations within this State. Those are of minor importance, but with that exception these figures are all taken directly from the company's records in the first nine columns of Table 3.

Then for the distribution of car-miles by districts, as shown on columns 10 to 13 of Table 3, I get my freight-car (766) miles from another form used by the carriers, and again I have to make some apportionments on these main-line districts, and also because their figures do not apportion between different branch lines; and in
403 attempting, therefore, to ascertain how many train-miles and car-miles are to be found on a branch line I have to make apportionments. And those apportionments are explained in the text here on page 34, under the head of "Distribution of car-miles by districts." They simply contain allocations which are made on basis which are explained here, and I think it would be unnecessary to go into them.

The loaded-car miles for a district were obtained by dividing the net ton-miles on each district by the average loading of loaded cars on the division as given by the company in Form 522, and then making some small adjustments to make the total equal to the total given for the State in the annual report. Empty-car miles I get by taking the loads from the totals.

Table 4 contains the calculations for resistance, first, westbound on page 38, and eastbound on page 39.

The resistance here includes that of the locomotive and tender as well as the cars.

Here also I had to do some apportioning, the records of the company showing totals for branch lines of a division but not the amounts for each division. That is particularly in locomotive ton-miles. For example, for the second division (767), which is complete in Oregon, the number of locomotive ton-miles is given for the main line, made up of four districts, and another total is given for the branch lines, made up of two branches, and it was necessary for me to apportion those totals between the different districts. That

has been done in general on the basis of locomotive mileage;
404 but that is not true of the main line of the second division, where on account of the mountain grades there is much heavier engine service between Rieth and La Grande than there is between La Grande and Huntington, and I apportioned the locomotive ton-miles in those districts by taking the number of gross ton-miles hauled over the districts, taking into account the resistance overcome in that haul and making my apportionment so that the number of locomotive-miles would correspond to the product of gross ton-miles multiplied by equivalent rise on the district; that is taking into account in that manner difference of grades. By locomotive-miles I mean locomotive and tender. I didn't count caboose in here at all in this total. Non-revenue freight I apportioned finally, after getting all of my—well, first, in this particular case these figures (768) would include non-revenue freight. Yes; they would be included in this tonnage.

On page 38, column 7, I have figures under caption "Average weight of car." I haven't gotten to that yet.

Gross-ton miles in column 4 in Table 4 are the same as those shown in Table 3, where they have been taken from the company's reports. And in column 5 I take the total of the gross ton-miles and the locomotive ton-miles for each district. Then having that figure I divide it by the mileage and obtain a figure in the sixth column which is the average tons moving over the entire district, it would product with the same number of ton-miles that are shown in columns 3 and 4, if the movement were over the entire district. I have found from study in previous case that if I took the tons added to or subtracted from the freight movement at each station on a district and worked out my ton-miles and the resistance over-
405 come over the district by that more exact method, that I got so near exactly the same figure that I got by simply taking this average figure of tons and assuming that it moved the entire length of the district, that I considered it entirely unnecessary to go to the greater refinement of figuring the tons in and out of each station and over the corresponding portion of the district. It is true there might be instances (769) in which that would make a difference, but as far as anything that we have to consider here is concerned I am confident it would not make any difference at all.

The average weight of the cars is found by dividing the gross ton-miles by the total car-miles of each district, as shown in Table 3. The reason that I want that figure is that experiments have shown that the frictional resistance on level track varies considerably with the weight of the car. It is more per ton for a light car than it is for a heavy car, and therefore I would have to take into account, in determining the total amount of resistance overcome as measured in foot tons, I have to take into account the average weight of cars on different districts. Light movement, empty movement is all in-

cluded in this tonnage, this gross tonnage. In column 7, the average weight of the car is loaded and unloaded cars—all cars. I arrived at that simply by taking this gross-ton-mile figure in column 4 and dividing it by the number of car-miles, loaded and unloaded. (770.) The gross-ton-mile figure would include both the loaded and empty movement. The empty car has a greater resistance per ton of its weight than the loaded car. And these gross-ton-mile figures include the loaded as well as the unloaded cars. Column 8
406 contains figures which are calculated from the profiles of the railroad of friction and curvature, and they are calculated for a 38-ton car which had a speed of 23 miles, which Schmitt's experiments show to have a resistance of 6 pounds per ton, equivalent to a grade of three-tenths per cent. My original calculations, which occupied quite a number of months of labor, applied to the different carriers in this country, were all based upon that particular figure, and therefore for this use here I have used those figures as a base and simply calculated by percentages what would be applicable to cars of other weight, and that is the reason for obtaining this figure of average weight of car, in order that by means of these experiments I might determine what factor would be applicable there. A 38-ton car, as shown by those calculations, would, for example, from The Dalles to Umatilla, have had to overcome a frictional resistance equivalent to lifting it 1,631 feet. That is shown on Table 4, page 38.

Well, I did not use a good illustration. The actual (771) weight of the car there was 38.4 tons, being so near that the difference for the actual car shown in column 9 is very nearly the same thing, 1,620. In other cases the difference is greater. For example, there is the Joseph branch with an average weight of car of 52.6 tons, so that the friction and curvature which would be correct for a 38-ton car are reduced from 623 to 487 feet for the actual car.

Those percentages are applied all the way through to the figures in column 8, so that those figures in column 9 are the corrections applicable for the particular weights of cars that actually moved over the different districts.

407 Then the next ascents are shown in column 10. Those are obtained in this way: If there is an actual rise, it appears in its full amount; if there is a falling grade more than sufficient to overcome all the frictional resistance, so that no power has to be exerted at all, I put in for that particular part of the movement nothing whatever, neither grade resistance nor curvature, frictional resistance. The descending grade overcomes all of it. If there are grades, descending grades so light that friction is greater than the descent, the descent not sufficient to overcome the friction, then the friction itself is included in my calculation and the amount of the descending grade is put in as a subtractive factor.

The remainder is what is shown in column 10 as the net ascents. (772.) It is actual ascents less those descents which are under a

three-tenths per cent grade, and for which districts, or for which parts of the road fractional resistance has been included in the calculation.

Column 11 is the sum of columns 9 and 10. That is the total equivalent rise for the district in question for cars of the weight which actually moved over it. Then finally this total equivalent rise in column 11 is multiplied by this average number of tons of column 6, giving me the foot-tons which are shown in column 12, the obtaining of that being the purpose of this table.

As to the significance of the figure, the upper right-hand corner of page 38, total of 28,375,000 foot-tons in comparison with the total at the upper right-hand corner of page 39 of 44,479,000 foot-tons, the first on page 38 is the total number of thousands of foot-
408 tons of resistance overcome in the moving of freight west-bound on the O.-W. R. & N. lines in Oregon in 1927. The other, of 44,000,000, is the corresponding figure for eastbound movement. The difference in those two totals is due to the fact that greater part of the freight of this carrier moves east, and that in general on its lines eastbound grades are heavier than westbound grades. (773.) That completes explanation I had to make of Table 4.

I come now to the finding of unit costs themselves, having obtained the figures for the total costs and the total number of units. I did not make any attempt to get it for l. c. l., because we are not interested here, and it would be a very great amount of labor to find the number of tons to which the total cost figures would be applicable. There is a good deal of difficulty in regard to terminal. The figures obtainable did not in some cases cover the entire year, giving me only six months. They do not give the figures in the form in which I want. What I want to get for the purpose of application of these costs is the number of cars delivered to consignees, the number of cars originated, the number of cars interchanged, and the number of l. c. l. cars orginated, and of similar cars delivered.

There are two pages here, 40 and 41, which explain the manner in which I have made estimates of the numbers of these operations, and from them I get the figures which are shown at the top of page 42 as the total number of units. Under that you will observe that I have as delivered to consignees 52,090, and then, not in the column but in the figures preceding it, cars originated 71,058, cars inter-
409 changed 43,393 (744), l. c. l. cars originated 26,470, and l. c. l. cars delivered 19,400.

Now it is my own estimate that the terminal cost of delivering a car to a consignee is less than that of originating a car, and I take the delivery as my unit of terminal operation, and I estimate that the cost of origination is one-fourth greater, that is one and one-fourth units of interchange with the connecting line as equivalent to half that of a delivery, and the origination and delivery of l. c. l. cars each

as one-half, and I leave out the empty cars, considering the movement of the empty car to the shipper, or from a consignee, as part of the above units, and that all the handling of empty cars is part of those miscellaneous movements which can not be attributed to any specific shipments. Therefore I weight the figures which I have just read a moment ago by these proportions of one and a quarter and of one-half, obtain from that an estimated number of unit operations, that is the equivalent of 185,544 cars delivered to consignees. In figuring the cost, that figure of 185,544 is to be set up against the total of operating expenses attributed to the terminal carload, as shown on page 29, $1,575,896, plus a similar total on page 33 of an interest charge of $494,800, but it first needs some correction, because there are switching operations in the large yards which are paid for separately, and in order to eliminate those from this consideration I
(775) make some estimates as to their amount in cost.
410 Switching revenues for the O.-W. in 1925 were $445,000, and I estimated from what data I could get that 58 per cent of those were handled at Portland, so I took 58 per cent of those switching revenues, $258,000, and attributed those to operations at Portland.

The direct cost of earning this amount I took at 75 per cent of the operations, because 75 per cent is just about, I think, the operating ratio of the company for all its operations. I have no other guide as to what that cost would be, and I therefore took off from my cost this $194,000 leaving me for operating expenses as the cost of this unit of movements $1,381,896. That divided by 185,544 unit operations would give me a cost per unit of $7.45.

Similarly dividing the interest charge of $494,800 by the same divisor, I would have $2.67 per unit, making a total of $10.12 for the average cost of a car delivered. Then using my ratio of one and one-quarter I would have for cars originating $12.65, and for cars interchanged one-half of the delivery, or $5.06.

Now, in the larger cities the cost would run higher than at the small stations, and this has to be taken into account in calculating the cost of any specific movement.

This analysis is not as good as I wish it was; it is the best I can make under the circumstances. I think that the (776) estimate of cost is reasonably accurate, but it would be an immense amount of labor to determine, except in this approximate fashion, how many terminal handlings there were actually performed by the carrier,
and I can only estimate the relative cost of the origination,
411 delivery, and transfer. I think it probable that the company could, if they desire, furnish somewhat more accurate estimates, perhaps very much more accurate estimates of the number of these handlings. I do not know whether they keep that or not; I was not able to find that they did have anything of that kind available that I could get. The important thing to keep in mind in connection with the conclusions I have reached as to the cost, the

terminal cost, the terminal unit cost that I have just been discussing, is that I ascertained it was $10.12 for a car delivered, $12.65 for a car originated, and $5.06 for a car interchanged. Those are the terminal cost units that I have used throughout this study.

My next cost item is the train-mile; the total number of main-line train-miles was 1,056,048. These are from the company's statements. And the 50 per cent direct percentage of the branch-line mileage would be 140,168, making a total of 1,196,216. The (777) cost of operating expenses shown in Table 1 was $721,825, or 60.3 cents per mile. The interest charge was $41,625, in Table 2, or 3.5 cents per mile, making a total direct cost per train-mile of 63.8 cents. The figure 63.8 cents is the train-mile cost unit that I am using in my cost study.

Number of car-miles was 63,778,000, and the operating expenses, from Table 1, $1,340,570, equal to 2.10 cents per mile. The interest charge was $311,725, or .49 of a cent per mile, making the total direct cost 2.59 cents.

The gross ton-miles—I have used that word because it is familiar as expressing the effect of weight, but when I come to this particular factor I use the weighted gross ton-mile, in which I double
412 the weight of cars and contents, or the weight of the locomotive, and added to the weight the cars and contents, giving me equivalent ton-miles, as they are called and explained on page 10. These amounted to 3,343,000,000 ton-miles, and the operating expense charged to them was $669,200, or 20 cents a thousand.

There is no interest charge to this account.

Resistance overcome, shown by Table 4, both east and west, was 72,854,000,000 foot-tons, and the operating expense ascribed to it $3,262,955, or 4.48 cents per thousand, while (778) the interest cost was $346,100, or .48 cent per thousand, making a total direct cost of 4.96 cents per thousand foot-tons.

For convenience of reference and of an understanding of the subject, I have assembled these elements of unit costs in the table below and have shown what portion of each one of them arose out of the main classifications of operating expenses. There is nothing in that that has not either already been stated or can be found from the figures given in other tables.

If you take in Table 5 the sum of the various items under the heading "Terminal carload," the direct total cost is $10.12. That is the exact figure I gave as the total unit cost for a car delivered.

Adding in the next column the items under the caption "Train-mile," I get a total of 63.8 cents, and that corresponds to the figure I have just explained as our average total direct cost per trail-mile. And so all the way through, those figures on the last line in Table 5 indicate the items of expense opposite particular accounts that went to make up the total. It is useful to have those divided in
413 this fashion, because it enables one to determine at once what the effect (779) would be in a change in any one of the main

items; as, for example, if it were a question of the effect of the cost of train fuel, it is shown there in the last column as contributing 1.88 cents to a total of 4.96 cents, so that if the fuel, for example, were to become one-half as expensive you would be able to determine how much that would affect the total unit.

I arrive at 2 mills per gross ton-mile. Now if you observe, on Table 5 here, that is made up entirely of maintenance-of-way expense plus proportion of general expense. It in nowise represents any such figure as one often attempts to make of a cost of a railroad's operations based on its gross ton-miles. It is only in my analysis by my reasoning that proportion of the expense which varies in absolute accordance with the gross ton-miles. (780.) I count the locomotive weight as double in arriving at this figure. Ordinarily a locomotive and tender is about 15 per cent of the total gross ton-miles. (781.) As I recall, after doubling it becomes eighty-three per cent, the total. That is shown on page twelve, in the ratio of 783 million to 2,560 million. That, of course, is a figure applicable only to the O.-W. R. & N. The percentage of total operating expense applicable to terminal expense has been shown here as operating expense. That would be here in Table I—twenty-seven per cent, including l. c. l. I get that by adding the two percentages on page 29, 8 and 19. That completes my study and analysis so far as the Oregon-Washington Railroad & Navigation Company operations in 1925 are concerned. Now I proceed with a similar study and analysis for the (782) Oregon Short Line in 1925.

414 The traffic density on the Short Line is substantially the same as that of the Oregon-Washington Railroad & Navigation Company lines in Oregon, and I therefore use the same percentages of direct as for that road, except in certain accounts where the different percentages of tracks in main line and in your tracks, passing tracks, and so on, effect the calculations which I have previously made for the Oregon-Washington Railroad & Navigation Company.

That gives me, for example, for ties, working it out on the same percentages applied to each track, with the cost of the different mileages, I get that account to be twenty-two per cent direct, instead of twenty-four as I have on the Oregon-Washington Railroad & Navigation Company. That is the only percentage which I change in the maintenance of way.

On maintenance of equipment and traffic I took those throughout the same as the Oregon-Washington Railroad & Navigation Company.

On transportation there are some differences, due to a difference of branch-line mileage again in its proportions.

I note that the Oregon Short Line branches carry considerably less freight per train than those of the Oregon-Washington Railroad

& Navigation Company, resulting in greater (783) expenses per thousand gross ton-miles, and on that basis I have estimated their branch-line service of thirty-five per cent direct, instead of fifty per cent as on the Oregon-Washington Railroad & Navigation Company, and it gives me a figure of eighty-seven per cent as the direct factor, in place of the ninety per cent which I had on the Oregon-Washington Railroad & Navigation Company, and assigns this
415 percentage to certain accounts. That is for the entire train service.

Fuel cost on the branch lines was about two and one-half times as much per thousand gross ton-miles as on the main line, and the excess over main-line cost for consumption of fuel represented ten per cent of the entire account, and I have therefore estimated that account as ninety per cent direct. Those changes have caused some slight changes in those average accounts which are apportioned the same as the average of all other accounts under the same head, and those—the figures resulting from that are shown in Table VI, in which, as in the corresponding table of the Oregon-Washington Railroad & Navigation Company, the first columns, passenger and freight, are figures taken from the company's annual report, and the columns under freight headed "Direct" and "Indirect" are the results of my apportionments, all the (784) explanations being the same as were the Oregon-Washington Railroad & Navigation Company tables.

Then under the allocation of terminal and road to the various unit operations, practically the same explanation would apply all the way through, that the figures—the apportionments are the same, except as affected by slight differences in the proportions of equivalent ton mileage, gross ton-miles, as compared with locomotive ton-miles. In this case the locomotive ton-miles equivalent was twenty-two per cent, instead of twenty-three as with the Oregon-Washington Railroad & Navigation Company.

And other accounts, like ties and rails, are affected in a small degree by the different proportions of the different classes of traffic, but I think there is no necessity of my going over those figures, particularly as regards maintenance of way. Except where there are differences in results that I want to point out, the method that I have followed in my study and analysis for the Oregon Short Line is no different than that for the Oregon-Washington Railroad & Navigation Company. It is the same system of doing it.

I think that would apply to pretty near all of these analyses. It would be of interest, perhaps, to consider (785)— well, this one particularly I ought to point out, station employees. I am referring to page 48. Page 48, under station employees. There appears to be considerable less l. c. l. tonnage on the Short Line proportionately than on the Oregon-Washington Railroad & Navigation Company, and, therefore, I modify my apportionment of the station employees expense accordingly, reducing the amount that goes to l. c. l.

That applies, also, to the next account, weighing, inspection, and demurrage, and to station supplies and expenses.

On yard expenses I compared those costs of the yards one with another, and the number of through and local cars handled, and the cars originated, and the yard expenses, and so forth, and from that I estimated that 40 per cent of the yard expense of the Oregon Short Line were terminal and 60 per cent had to do with through movements.

My figures on the Oregon-Washington Railroad & Navigation Company for the State of Oregon were just the reverse of those; 60 per cent were terminal, and 40 per cent were through movements on the Oregon-Washington Railroad & Navigation Company.

417 Now, in the discussion of train enginemen I made a similar study there after that on the Oregon-Washington Railroad (786) & Navigation Company, noting the difference in cost of enginemen per train mile on the different divisions, with different grades, but there are some other factors that come in there that make that less certain than I can make it on the Oregon-Washington Railroad & Navigation Company because the Montana division, while it has heavier grades, seems to use lighter locomotives all through, pulling smaller trains, and the Idaho division, while it has more rise per mile and heavier trains, it runs at slower speed, and its cost was very little more than on the Montana division with heavier grades, so that the effects there are evidently confused somewhat by some of these other factors, and making such apportionment as I was able to do on that basis, and as explained in the text, I got a figure of 10.7 per cent as the effect of resistance on this account of train enginemen, and that agreed so closely with the figure obtained in that manner by taking the excess of locomotive mileage over train mileage of ten per cent that I thought it at least a good check, and used the figure of ten per cent.

Similarly, here, I find trainmen making less miles run per hour worked on the local and way freight than on the through trains, and attribute that extra time spent to the time at stations handling freight, and therefore apportion the small amount of the time of enginemen and trainmen expenses to cover the expenses at the way stations, giving me for train (787) enginemen terminal charge of ten per cent, l. c. l. four per cent, train miles seventy-six, resistance ten.

418 Fuel for train locomotives; I estimate that the same as on the Oregon-Washington Railroad & Navigation Company, ninety-seven per cent chargeable to resistance.

In consideration of the effect of grades on expense of trainmen it is evident—or because of grades being more nearly uniform on the divisions of the Oregon Short Line than they are on the Oregon-Washington Railroad & Navigation Company, I didn't find any very great difference in those accounts, but I conclude that three per cent of the cost of trainmen may be charged up to resistance, and that

their work is divided as indicated by the greater amount of time used on the local and way freight-train cars, the same as with enginemen, and I find therefore l. c. l. ten per cent, carload ten per cent, train-mile seventy-seven, and resistance three.

Train supplies and expense I have compared with the Oregon-Washington Railroad & Navigation Company, but have allowed a larger amount for cleaning cars, because of the greater proportion of shipments of stock, coal, ores, and so forth, cars requiring cleaning, so I have reduced the car-mile percentage to sixty per cent, allowing thirty per cent to car-mile expense, and ten per cent for train-mile. (788.)

And then the other accounts under that head are sufficiently indicated in the text.

Turing to Table VI, on pages 52 and following, the figures in the first two columns, headed "Passenger" and "Freight," on page 52 and on page 54, were taken from the company's annual report.
419 The other two columns on page 52 and on page 54, and the computations on page 53 and 55 were made by me. It is understood to be the fact that the annual reports of the carriers to the Oregon Commission are set up in the same way and the separations made on the same basis as to the Interstate Commerce Commission. There is no explanation needed in connection with Table VI. which I haven't made for the corresponding table for the Oregon-Washington Railroad & Navigation Company. It is made in the same fashion, and the arrangement is the same throughout. (789.)

I have no knowledge of the investment on the Oregon Short Line, and I have assumed that the interest—per unit operation would be the same as on the Oregon-Washington Railroad & Navigation Company and added in the same amount for interest.

In regard to the foot of page fifty-five, Tables VII and VIII, on pages 56–B and following, and 56–D and following, there is a little confusion in the arrangement of the pages. It came about in attempting to get these pages so that they might be printed in the manner they are, running on from one page to the other. These two pages ought really to precede what appears on page 56. It isn't of any particular consequence, except that it is confusing. The subject of unit operations and costs should come after the tables. The tables are made up precisely as has been explained in regard to tables —, that is, Table VII exactly (790), the same as Table III on page 37 to the Oregon-Washington Railroad & Navigation Company, and Table VIII in exactly the same way as Table IV. I think they require no special explanation.

Going ahead with those discussions on page 56 and following. Here again, I have attempted, as regards the terminal,
420 carload, to find how many cars were handled in each of these various operations, while I want to put them on the same basis as those of the Oregon-Washington Railroad & Navigation Company, and I compare them as indicated there by the percentage

which the known factors bear as shown by the reports, and use those percentages for the factors which I had to estimate on the Oregon-Washington Railroad & Navigation Company.

That is explained in the text, and by means of that I obtain the figures given in this little table not numbered as a table but shown under "Unit costs," "Cars delivered to consignee," and "L. c. l. delivered," to each of those applying the same factors as in the other case, and obtaining a total of 314,400 unit operations.

I make a similar deduction there for switching revenues, and reduce my operating expenses in Table VI for (791) terminal, which are shown on page 55 as $2,028,560.00, by the amount of $96,000.00, and then dividing by this number of units I get a unit cost on the Oregon Short Line of $6.15. I add the same interest charge of $2.67 as on the Oregon-Washington Railroad & Navigation Company, making a total of $8.82 for a car delivered. Adding one-fourth, I get $11.024 origination, and taking one-half I have $4.41 for interchange.

The number of train-miles, total of 3,453,000, and the cost in operating expenses, $1,742,000.00, giving 50.4 cents per train mile. Adding the same interest charge as on the Oregon-Washington Railroad & Navigation Company makes a total cost of 53.9 cents per train-mile.

421 Going now to page 57, the number of car-mile is there given, 156 million, operating expenses $3,037,000.00, making 1.95 cents per mile; adding the interest charge on the Oregon-Washington Railroad & Navigation Company of .49 cents makes 2.44 cents.

Total gross ton-miles, 6,256,000,000, plus twice the locomotive ton-miles, gives me a total of 7,997,000,000, weighted ton-miles. The cost in operating expenses $1,320,760.00, or 16½ cents per 1,000. (492.)

Total resistence 130,112,000,000 foot-tons, and the cost in operating expenses $5,452,738.00, 4.19 cents per 1,000. Adding interest at .48, makes a total of 4.67 cents.

Then in Table IX, I set up a table in which these unit costs and their make-ups throughout are compared for the two carriers.

Taking the bottom line of this table and comparing the five unit costs on the two systems, that is, the total direct costs for the five units on the two systems, for terminal carload I find for the Oregon-Washington Railroad & Navigation Company $10.12, and for the Oregon Short Line $8.82.

For train-mile I find, respectively, naming the Oregon-Washington Railroad & Navigation Company first each time, 63.8 cents and 53.9 cents.

For the car-mile, 2.59 and 2.44.

For the gross ton-mile, 20 cents a thousand and 16½ cents a thousand.

For resistance per 1,000-foot tons, 4.96 cents and 4.67 cents.

That shows that the totals in every instance show higher unit costs on the Oregon-Washington Railroad & Navigation Company than on the Oregon Short Line. (793.)

422 There is nothing further in connection with this table that I want to point out.

In the application of these units it is necessary to take into account that there are certain factors which add to cost and do not appear in the units themselves. The first one is the nonrevenue freight. Every railroad has to carry a large amount of freight for its own operations.

The Oregon-Washington Railroad & Navigation Company in 1925 had no new construction going on, so I consider that all of the cost of handling nonrevenue freight by that company in that year would be chargeable to the cost of revenue freight and passenger service. In order to determine how much of it ought to go to passenger, I consider this, that passenger fuel itself costs about twenty-five per cent of the total cost of fuel, and passenger revenues were just under twenty-five per cent of the entire operating revenue, and I concluded therefore that a fair apportionment would be seventy-five per cent of the nonrevenue freight to the revenue freight. And on ton-miles the nonrevenue freight on the lines in Oregon were 124,000,000, seventy-five per cent of which is 93,000,000. The ton-miles of revenue freight were 1,033,000,000. There were therefore .09 of a ton of nonrevenue freight whose cost has to be added to each ton (794) of revenue freight.

On the Short Line the passenger fuel and expense were in very nearly the same proportion, and there was only a small amount of transportation in connection with new work, so I took the same figure of seventy-five per cent.

The ton-miles of nonrevenue freight were 261,000,000, seventy-five per cent of which is 196,000,000. Revenue freight, two

423 billion, four hundred sixty-seven million (795)—I mean the ton-miles of revenue freight—2,467,000,000, so that there is .08 tons of nonrevenue freight to be charged to each ton of revenue freight on the Short Line.

The Southern Pacific lines in Oregon show a larger percentage than this, but they had a large amount of new construction going on at the same time, and therefore for Southern Pacific calculations I used the same ratio as the Oregon-Washington Railroad & Navigation Company, 9 per cent.

On the Central Pacific in Nevada the ratio was 7 per cent.

These percentages have been used in my calculations further on, as explained when we come to them.

Then there is the question of relation of empty-car movement to the loads. For each loaded-freight-car mile east on the main line in Oregon in 1925 there was .44 of an empty-car mile west, and for each loaded mile west .25 of an empty mile east.

On the east and west main lines of the Oregon Short Line there was .57 of an empty west for each load east.

A statement of the Oregon-Washington Railroad & Navigation Company shows that in 1925 there were 57 per cent as many empty cars moved west through Huntington as there were loads east.

In 1926 that ratio was 60 per cent, and for the first six months of 1927, 57 per cent. (796.)

The records of the Southern Pacific lines in Oregon show northbound, empty-car miles 13,186,000, and southbound, 1,920,000. That was for 1925; that is, 87.3 per cent of the empty movement was north.

Another report gives for the same division loaded-freight-car miles of 33,410,424, and empty 16,218,113.

424 These figures do not quite agree with the first report, but I assume that the ratio would hold and that 87 per cent of the 16,218,000 of empties, or 14,160,000, were northbound.

Then I get the figures which are shown here from that:

Northbound loaded-freight-car miles 10,654,000, and empty 14,160,000, while southbound, 22,756,000 loaded and 2,058,000 empty.

That is, for each thousand loads south there were 623 empties north.

Then a statement of loads and empties in and out of the State received from the Southern Pacific shows for the period—there has been some omission here; I guess I made a mistake there—the period from August, 1927, as I recall it was, for the balance of the year, 60 per cent as many empties north into Oregon as there were loads south out of the State, so that for the purposes of this calculation, which were applied particularly to lumber, and also applied to some other (797) commodities, I estimate that each car moving east must be charged up with 60 per cent of the cost of an empty moving west, in order to obtain the load. Putting it in another way, for each one thousand loads of lumber east six hundred empties would have to be brought in. The information relating to these empty-car miles and loaded-car miles and other information relating to the Southern Pacific Company was taken from their own reports and statements to the commission.

Taking up the next topic of my study, it is only on these two roads, the Oregon-Washington Railroad & Navigation Company and the Oregon Short Line, that I have made these detailed studies for the purpose of obtaining unit costs, and the extent

425 to which they agree with each other has been indicated.

I want to apply these unit costs to operations not only over the roads on which the calculations were made, but on some other roads in the same part of the country, and I therefore make the comparisons which appear here on page 61.

The principal items in which these western roads differ in their expenses are the maintenance of way, on account of topography and climatic conditions, and the trainmen, on (798) account of loss governing train crews, which require larger crews in the State of

Oregon than in the other States involved here, and fuel, because of the difference in price at the stores and in the freight charges, and on account of differences in grades, affecting the quantity used.

I have shown here the comparative expenses of these roads, of certain roads, covering freight expenses only, as shown by their annual reports, and taking the entire amount and not attempting to make any analysis for them to determine how much was direct and how much was indirect.

I don't know how to account for the difference in trainmen per train-mile on the Southern Pacific in Oregon as compared with the Oregon-Washington Railroad & Navigation Company in Oregon. I don't know just why there should be that larger amount there under the same, but there is a very marked difference there. There is also a substantial difference in fuel cost, but that—I take it to be due to the fact that they have a very much larger branch-line operation, very much larger proportion of branch-line mileage, in this State than of main line, than the other line. I presume that might also account for (799) trainmen per train-mile, on account of having to pay a greater amount of constructive mileage.

426 I presume that it is for some such reason as that, that the branch lines don't enable them to make one-hundred-mile runs, and they probably have to pay a good deal of constructive mileage. I know of no other reason that might affect it.

The Southern Pacific does not use the same kind of fuel as the Oregon-Washington Railroad & Navigation Company. They use oil to a greater extent. The Oregon-Washington Railroad & Navigation Company use coal predominatingly. They use both oil and coal.

The comparison between maintenance of way per mile of equivalent main track between the Oregon-Washington Railroad & Navigation Company and Southern Pacific shows the Oregon-Washington Railroad & Navigation Company as having a greater cost than the Southern Pacific or the Short Line or the Central Pacific in Nevada. Those three comparisons, I think, speak for themselves.

Train fuel on the Southern Pacific is more expensive than (800) on the Oregon-Washington Railroad & Navigation Company, much less though on the Oregon Short Line, and on the Central Pacific, but that cost cannot be considered on the basis of those figures alone. It has to be modified by consideration of the relative amounts of resistance to be overcome on the different roads, and for that purpose I compare their main lines only, not taking into account branch lines, and I find that on the main line of the Oregon-Washington Railroad & Navigation Company from Portland to Huntington there is an average resistance, the mean of both directions, of 25 feet to the mile, while on the Short Line from Huntington to Granger, leaving out the north and south lines, the average is 18.2

427 feet; and on the Southern Pacific main line in Oregon the mean is 25.9 feet; for the Central Pacific lines in Nevada, 18.1.

That is, the Oregon-Washington Railroad & Navigation Company and the Southern Pacific are very nearly the same, while the Oregon Short Line and the Central Pacific have considerable less grade, on the average.

Now, if these figures of train fuel were corrected to what they would be if there were an equal amount of resistance to be overcome on the Short line and the Central Pacific we would have the figures shown here, relative figures shown near the bottom of the page, Oregon-Washington Railroad & Navigation Company 53.9 cents, Southern Pacific 70.6, Short Line 36.8, and Central Pacific 37.3. (801.)

I take it that these differences are affected by the price and the efficiency, except that as regards the Southern Pacific there is probably that fact of an excessive proportion of branch-line mileage.

There are several districts here upon which I want to apply these unit costs, either directly as found or as modified according to the circumstance.

First, taking the cross-State line itself, and including the Crane branch from Crescent Lake to Ontario, that country is similar to the Oregon Short Line, except that its grades are somewhat better than those on the Oregon Short Line, on the average.

I consider, therefore, that the maintenance cost due to traffic should not be more than on the Oregon Short Line, and I put it at the same amount and used the same figure of 16½ cents per 1,000
428 gross ton-miles, and the requirements in regard to train crews will be the same as on the Oregon-Washington Railroad & Navigation Company, and the cost of trainmen, therefore, ought to be the same, and since the train-mile cost, as shown in my analysis in Table IX of the make-up of these unit costs, is practically the same as on the Short Line (802). I use the Oregon-Washington Railroad & Navigation Company cost unit of 63.8 cents.

The car-mile cost I take that the Oregon-Washington Railroad and Navigation Company rate of 2.59 cents. I think that that is a fair figure, and I use that also for the competing route via Klamath Falls, so that the question is really as to whether there should be any difference between those two, rather than as to the exact amount.

The cost of fuel I would expect to find intermediate between the Oregon-Washington Railroad & Navigation Company and the Oregon Short Line, and since that is the principal factor in resistance cost I take the mean of the two cost figures of the two carriers and put it at 4.82 cents per 1,000 gross ton-miles, and I therefore have my unit costs as modified and as shown at the end of this paragraph.

I use the same figure of 9 per cent of nonrevenue freight for those operations in Oregon as I have used for the Oregon-Washington Railroad & Navigation Company.

I haven't shown anywhere else in my report nonrevenue freight as one of the unit costs. That is rather a misnomer there, to call it a unit cost, but it has to come into account in these calculations in the

same manner as unit costs. It is convenient to include it with them here. (803.)

My study is predicated on this first item, Crescent Lake to Ontario, on the assumption that the existing mileage from
429 Ontario to Crane is comparable with the Short Line mileage—that is, the character of the traffic as far as these direct-cost units are concerned.

I have been over a pretty large part of the country covered by these various hauls I am going to discuss now, and have observed it from the standpoint of an engineer.

Now taking Eugene to Klamath Falls. This is Southern Pacific operation, and those operating conditions on the two carriers are near enough alike so that I think the difference in cost of fuel and trainmen must be attributed to the greater amount of branch-line mileage on the Southern Pacific, and I intend to deal here only with main-line operations as far as the Southern Pacific is concerned, and I therefore use for this purpose the same unit costs for train-mile, car-mile, and gross ton-mile as on the Oregon-Washington (804) Railroad & Navigation Company, and, on the other hand, the maintenance-of-way cost there is less than on the Oregon-Washington Railroad & Navigation Company, on the average, but I think again that is the same cause, and I don't believe it would be any less so far as affected by traffic on the main line which crosses the mountains. I therefore use it for this section, the same unit costs throughout as I found throughout for the Oregon-Washington Railroad & Navigation Company, with the exception of the terminal carload costs, which is high on the Oregon-Washington Railroad & Navigation Company on account of the Portland terminals.

There are no similar conditions at any point involved in this comparison on the Southern Pacific lines, so I used, instead of the Oregon-Washington Railroad & Navigation Company cost, the Oregon
430 Short Line unit cost, giving me for unit costs for this section of the Southern Pacific those figures which are shown at the bottom of the page. Again I use the same percentage of nonrevenue freight.

The next haul is from Klamath Falls to Sparks. Sparks is a division point on the Central Pacific about 30 miles west of Fernley, which is shown on the map. It is between Fernley and the State line. At the time that I made this up I didn't have (805) figures of the cost of the Southern Pacific operations in California, but I did have those of the Central Pacific in Nevada, and I used these for the Southern Pacific in California, except on maintenance of way, which I conclude is as extensive as that of the Oregon-Washington Railroad & Navigation Company lines in Oregon, and I therefore use the unit costs of the Oregon-Washington Railroad & Navigation Company for the gross ton-mile, but use for the other units the same as found further on here for the Central Pacific. That is shown in the next

paragraph here, Sparks to Ogden, and Klamath Falls to Ogden via Alturas. I take those at the rates that are indicated for the Central Pacific in Nevada.

The maintenance of way shown on page 61, to be the same per mile as that of the Oregon Short Line; consequently I used the rate for the gross ton-mile. The cost of trainmen is shown as 9 per cent higher by their annual report than on the Short Line, and the addition of 9 per cent to train-mile gives to the item of trainmen in the train-mile cost on page 58 for the Short Line would have the effect of adding 1.9 cents to the entire train-mile cost, and I consequently make that addition, adding 1.9 cents to 53.9, giving me 55.8 cents as the train-mile cost for these operations in Nevada. (806.)

431 Fuel, shown on page 61, to cost 1.4 per cent more, which adds .02 cents to the resistance cost, by making that addition to the fuel cost shown on Table IX, giving me for resistance cost per 1,000 foot-tons 4.69 cents, instead of the 4.67 found for the Short Line.

I use for that the 7 per cent ratio of non-revenue freight which I find to be the fact on the Central Pacific. The paragraph above, where I was referring to the unit costs for the haul from Klamath Falls to Sparks—I had in mind there the haul via Roseville.

From Ogden to Omaha and Huntington to Granger I use the Short Line costs.

On page 64 I take up the question of car and train loading.

I have taken for the load of fir lumber moving from the Willamette Valley east 35 tons, and with a tare weight 21 tons, making a gross of 56 tons; and for loads from the pine districts east of the Cascade Mountains 25½ tons in cars of the same weight. In taking these average loads of fir and pine lumber, I arrived at the figures of 35 and 25½ tons from (807) statements furnished by the Southern Pacific, which are explained—which are referred to later on, that the average loading of the fir lumber was about 35 tons. And the average loading of pine about 25½. These figures for fir and pine lumber loading include the average of all the kinds of cars used.

Carloads of other commodities eastbound were found to weigh about 20 tons net, and I have used 41 as gross.

Westbound loads, 17 tons, 38 tons gross.

The average number of cars per train on the Short Line main line was 46.3, but what I want to get here is the through

432 trains, and making some assumptions here as to the main-line train-miles—how many of them were way freights and what they would have—would have left me 56 cars east, which was the same figure I had used in the calculations on the Oregon-Washington Railroad & Navigation Company haul to Crane, and I think those assumptions are reasonable enough to permit me to make them here and to use that same number of 56 cars for the average

through train for these calculations, and I therefore in my calculations—I charge up 1/56 of the cost of each train (808) mile to each car of freight.

Now, I find from calculations made of locomotive ton-miles and gross ton-miles and the resistance on different districts that, taking those districts in the direction of the maximum loading—maximum movement, I mean, so that the trains would be fully loaded—there would be an average weight of locomotive and tender of 5.1 tons for each 1,000 gross tons for each foot of equivalent rise per mile. I use that therefore for calculation of the number of tons of locomotive to be attributed to each carload of freight. That is a mere rule of thumb, convenient for this particular purpose, this study here. It is defective for some purposes for which such a study as this might be used. It is defective in this respect, that it doesn't allocate to a particular section of the road having the steep grades all of the locomotive service that actually is confined to that particular section that has the helper service, but it simply treats it on the basis of distributing all locomotive mileage over the entire district. There is no calculation involved in this particular case where that makes any particular difference, where it might be easy to
433 use this, or attempt to use it, in some cases where it would make a difference, and some correction would have to be made for that purpose. When I come to use those in my calculations, this ratio as found here, I take the actual weight of the car, and for the purpose of figuring resistance I add to it (809) the number of gross tons found by this rule to be applicable as the weight of the locomotive, and then for the purpose of calculating the effect on the track I double that locomotive allowance, and in each case I add a proportionate share of the weight of the caboose, .03 of a ton, where it is 56 cars to the train.

I get this figure of 56 tons weight that I mention here on page 64 in the next to the last paragraph as 35 tons of fir lumber plus 21 tons, being the tare weight of the car. That is how I get that 56-ton weight. I add 21 tons to 25½ tons of pine lumber, as the average loading, and get the other figure of 46.5-ton cars. (810–811.)

Now referring to page 65 of my report. On that page I have a table showing the equivalent rise for a very considerable number of districts, in preparation for calculations which follow. I have already explained the manner of the calculation of the friction and curvature, and the application of percentages for different weights of cars.

In Table 10, beginning on page 65, I give the friction and curvature for various weights of cars over different districts. There are shown in successive columns the corresponding figures for cars of different weights, percentages applied to obtain those being indicated in the text at the top of the page. Cars of 56 tons, for example, offer 74 per cent as much frictional resistance as those of 38,

434 and cars of 46½ tons 66 per cent, and so on. That means, that is, as much frictional resistance per ton as those of 38 tons per car. (812.) Page 65 would be improved if in the first sentence "per ton" should be inserted after the word "resistance." The sentence should read, "Cars of 56 tons weight offer 74 per cent as much frictional resistance per ton." "Per ton" ought to be inserted there. And the same insertion should be made in the next two sentences as applying to the other weights that are mentioned there.

Forty-six and a half ton table is prepared for use in calculating certain empties which have about that weight, 21 tons for the empty car. And in the eastbound on the next page—well, there again I haven't read the proof on this since this came back, the words "eastbound" have been omitted from the top of the succeeding page, 66. The statement here, Eugene to Crescent Lake, and so on, indicates that they are eastbound, but it was intended to mark that so there could be no mistake about it.

Going back to page 65, the column headed "21 tons" refers to an empty car. That is the reason for its being inserted here (813); 38 tons, and 46½ tons, are cars that include the load as well as the tare weight. Let me add right here that for the purposes of calculation, for a 46½-ton, for example, that first figure of 4,968 feet must have added to it the figure in the last column of net ascents, 2,434 feet; likewise the 21-ton car of 8,500 must have the same addition made. That is because, in order to get what is called equivalent rise, you must take both the net ascents in feet and the equivalent rise in feet, due to friction and curvature, and add the two together.

On page 66 there they are the same thing for eastbound,
435 except that in all those four columns 38 tons, 56 tons, 46½ tons, and 41 tons—those represent both the tare weight and the load in the car.

Now going to page 67 in regard to the first calculation of direct cost of hauling fir lumber from Eugene to Ogden via Roseville. (814). Taking a car of fir lumber weighing 56 tons, the unit costs used between Eugene and Crescent Lake are those shown at the head of page 63 as applicable between Eugene and Klamath Falls, and considering now the load eastbound the distance is 96 miles. The equivalent rise is to be found on page 66 for a 56-ton car, 1,330 feet, plus the net ascents of 4,349, making a total of 5,679, which, being divided by 96 miles, gives the average equivalent rise per mile of 59 feet. The locomotive-miles, tons to be added, are therefore to be found by multiplying 59 by the weight of the car, 56, times that factor, which I find on the third line of .0051, as the ratio of locomotive-ton weight to the gross ton weight. That factor has been combined here for convenience in getting these to .286, which is the product of 56 times .0051. That makes 16.9 tons of locomotive, which weight is to be added to the weight of the car in calculating the resistance.

I first put down the train-mile, the 96 train-miles for the train at a cost of 63.8 cents each, and I attribute one fifty-sixth of that amount to this car, making $1.09; the car-miles at 2.59 cents, which, times 96, amount to $2.49. Now the gross ton-mile weight to be considered is made up of the weight of the car, 56 tons, three-tenths of a ton to cover the proportion of the caboose weight, and twice this 16.9 tons of locomotive. Altogether that makes 90.1 tons.

So my gross ton-miles for this consideration are 96 times 90.1
436 tons, and (815) the unit cost is .02 of a cent each, making $1.73 as representing the gross ton-mile cost of that haul.

The resistance is figured on the weight of the car plus the three-tenths ton caboose, plus the 16.9 tons locomotive, making 73.2 tons, which is multiplied by that 5,679 feet of equivalent rise for that district, and that again by .00496 cents of unit cost per foot-ton of resistance, giving me for resistance cost $20.61. Then to cover non-revenue freight I add 9 per cent of those four items, which is $2.33, making me a total for the load over that district of $28.25, which total of $28.25 reflects all the unit costs except terminal.

I think I had better go through some more of these because of different uses here. Now from Crescent Lake to Klamath Falls is a downhill line. It would take more locomotive weight to haul an empty car up that grade than would be required to haul this load down. As I consider that locomotive weights—locomotive travel, mileage, weights and all, must be the same in both directions, I take the locomotive weight that would be required for an empty (816) car, which is calculated in the same manner as this for the full car but going in the opposite direction, and I find that to be 3.4 tons, so I add 3.4 tons in this place, instead of 16.9 as on the preceding district. The other calculations are made in the same manner, and I get for that Klamath Falls $7.89.

Now when I come to Klamath Falls to Dunsmuir other factors are treated in the same fashion, but we come into this part of the line, noted as on page 63, from Klamath Falls to Sparks, where I
am using a different set of unit costs. Train-mile, for ex-
437 ample, is 55.8 cents instead of 63.8, while car-mile is 2.44 instead of 2.59, and the resistance is .00469; and the non-revenue freight addition is 7 per cent instead of 9 per cent. So that I find from Klamath Falls to Dunsmuir for the load $10.72.

From Dunsmuir to Roseville I am still using the same weight, the same unit cost as in the last one, but again I have to use the weight of empty car, because of it being a downhill run for the load.

Roseville to Sparks is also on these same unit costs, and in this case again we have the mountain grades calling for that very heavy weight of locomotive to be attached, and giving me for that 140 miles $36.69.

I go on with those over the different divisions. Beyond Sparks I get to those Central Pacific unit costs, and then I (817) have

again another set to be applied slightly different, the main difference being in the gross ton-mile cost. These calculations and different paragraphs down to the middle of page 68 all relate to a loaded movement. In the first line I have Eugene to Crescent Lake, load; Crescent Lake to Klamath Falls, load, and so on; and the last one relating to the loaded movement is Alazon to Ogden, load; then commencing along there the first lines of these paragraphs read Ogden to Alazon, empty; Alazon to Weso, empty; and on over to the middle of page 69, Crescent Lake to Eugene, empty. On pages 68 and 69 I have computed in a similar way the cost of moving an empty car from Ogden to Eugene over the same route. And that requires no explanation other than to call attention to this: That I use, as attached to the empty car, the same weight of locomotive that was used for the loaded car going in the opposite direction. My assumption is that the use of the locomotive for the loaded car compelled its return, and that that should be included in the cost of the empty in the other direction.

438

In the summary on page 69, at the foot of the page, I simply add together these various detail calculations (818), taking their totals only. The first set of figures consists of the loads. The cost of the load haul from Eugene to Ogden is $147.39. Now the cost of the backhaul of the empty is $98.00, and I have previously explained I have estimated the proportion of that empty-car haul to be charged to the load east at 60 per cent, and I therefore take 60 per cent of $98.00, $58.80; then my cost of origination at Eugene was $11.00, estimated, to which I add the 9 per cent, the 9 per cent having been added to all the previous items already to cover nonrevenue freight. After that figure 11 there is a sign indicating that that is to be divided by 9 per cent. It should be a plus sign there. I think that is the only place that mistake has been made. Also in the line below both of those are plus signs.

On the interchange at Ogden I add 7 per cent in place of 9, because 7 per cent is the nonrevenue freight ratio on the Central Pacific. The cost of the haul of the load (819) from Eugene to Ogden is $147.39, the cost of the empty from Ogden to Eugene at 60 per cent of the total is $58.80, the terminal cost for the origin at Eugene $12.00, and the interchange between the Southern Pacific and Union Pacific at Ogden $4.71, and those four items make a total cost of $222.90 for the movement of the empty from Ogden to Eugene and the loaded movement from Eugene to Ogden. I have followed the same method in computing the cost of the loaded movement and the cost of the necessary empty-car movement for the haul from Ogden to Omaha of fir logs. That follows on the next two pages, the total cost on the Union Pacific, Ogden to Omaha, being shown at the bottom of page 71 as $149.50. That includes the delivery to a consignee at Omaha. The computations on pages 72, 73, 74, and down to the bottom of page 75 are similarly made for

439

other hauls. I have shown similar computations for the hauls of pine lumber from Klamath Falls to various points; from Klamath Falls and other points of origin of pine timber, such as Medford and Bend. In these computations on fir lumber I have put the figure 56 tons. That includes the tare weight of the car. (820.) I figure that tare weight at 21 tons. At the bottom of page 73—that is the beginning of the computation covering the proposed cross-State line. It omits Eugene to Crescent Lake as being already calculated and being the same figure. It starts at Crescent Lake and goes to Crane. As between fir lumber and any other commodity there would be two or three variables except the loads of the loading. It would affect the gross ton-mile cost because of the inclusion of a less weight of locomotive, and it would affect the resistance cost for the same reason. At the foot of page 75 the calculation of the cost of pine lumber, Klamath Falls to Omaha via Alturas, my loading of 46½ tons includes 21 tons for tare weight of the car. The calculations from that point on through page 82 are already covered.

Now taking up page 83. (821.) There is a similar calculation to be made here, but under somewhat different conditions. I want to figure here what the difference would be on the cost of haul from Bend to Ontario by the existing O.-W. R. & N. route and by way of the Oregon Trunk as it now is to an intersection with
440 the cross-State line. Thence via the cross-State line to Crane, and by the existing route to Ontario. For the purpose of making the calculation on the Bend branch from Bend to Sherman I use 36 cars per train, that being the average train of 1925 on the Bend branch. And similarly in figuring from Bend to a junction with the cross-State line I use 36 cars per train. I assume in this that in figuring by the way of the Oregon Trunk there will be joint operation of the Bend branch by the O.-W., so that there will be no interchange between carriers required, so that no interchange between carriers, no two-line haul would be involved by a haul by way of Crane; that is, that the Union Pacific, if it built the cross-State line, would operate its trains out of Bend, the entire way to Ontario, via the junction. (822.) Comparing this first calculation with the results of the second calculation shown on page 85, at the foot of page 85, I get a cost from Bend to Ontario by way of Sherman of $104.24, and a cost from Bend to Ontario by way of Crane of $62.40. That makes a saving from Bend of $41.84 a car for the cross-State line as compared with the route via Sherman. The respective mileages to Ontario for these two routes are 475 miles by Sherman and 348 by Crane. That difference in distance would apply equally on shipments of lumber from Bend to all points east of Ontario.

The comparisons on pages 86 and 87, and on pages 88 and 89 are calculations on commodities other than lumber. These are calculations prepared in order to be used in (823) comparisons made further

on in the report. I think they are intelligible in the light of the explanations already made.

441 On page 90 I have shown the cost of moving fir lumber from Roseburg to Granger via Roseville, and also on page 91 from Roseburg to Granger via Crane, and from Roseburg to Granger via Roseville. The results of those comparisons I will refer to later. The same comparisons are made in regard to the cost of moving pine lumber from Medford to Granger via different gateways. I will compare the results of these comparisons later on in my study. The printer has omitted on page 91 to note that that was pine lumber, Roseburg via Roseville to Granger. The preceding calculations are on fir lumber, heavier loading. In the middle of page 91 this should read underneath that caption, "Roseburg via Roseville to Granger, pine lumber, 46½ tons." (824.)

On page 96 I have shown under caption "Westbound Commodities" cost of haul from Granger to Eugene via Roseville. I include in the word "commodities" an average of the commodities shown by the Southern Pacific statement to the Oregon Commission of tonnage moving westward, various commodities in 1926. It includes all carload revenue freight. I have shown there 38 tons gross in the caption. The tare weight of 21 tons per car is included in that 38 tons gross. The difference would be 17 tons; that is the average loading of all of these carloads of revenue freight westbound taking the nearest whole ton. Of all these carload revenue freight westbound these particular figures here that are before us are confined to the loads only. (825.) No computation of cost for empty-car haul was necessary because the preponderance of the freight movement was eastward, so that no empties would necessarily be hauled eastward in order to take these loads west. I have made a similar comparison of cost of this all carload revenue freight west-

442 bound between Granger and Eugene, or from Granger to Eugene via Alturas and via Crane, on pages 98 and 99. I put in calculations for all the routes possible. I will refer later to the results of those comparisons of cost. As to page 96 there would be no empty movement whose cost would have to be charged to these commodities. There would be actually empty movement in the same direction, and there would not be empty movement in the opposite direction in order to provide cars for these commodities, and I mean an empty car movement in the opposite direction.

In the calculations which I introduce I shall show a figure (826) for the westbound empty cars in considering the total of car movements of all the operations. But as regards these particular commodities it would not be proper to charge them with any part of the cost of hauling empties east in order to get the cars, because there will be plenty of loads going east to furnish the cars to come back with those loads, so many, in fact, that a considerable number of those cars would have to come back empty.

On page 102 there is simply collected together there the costs of empty hauls as it has been calculated elsewhere in connection with loaded-car movements. The total cost of moving an empty westbound from Granger to Eugene via Roseville is $108.13. If that empty moves from and to the same points via Alturas, the cost is $84.33; via Crane, the cross-State line, the cost is $66.90.

I have shown on the next page fir lumber to Utah. I use the same figures for the loaded and tare weight, 56 tons a car, for the purpose of this comparison and calculation. (827.) There is no explanation that I wish to make of this page 103.

443 Taking up page 104. This takes up the traffic already moving through Ogden to and from points on the Southern Pacific in Oregon. The Southern Pacific Company furnish the public service commission with a statement of the traffic of 1926 so moving, and for my own purposes here, for the purpose of calculating cost, I divided that into four districts: Klamath County, with an existing outlet via Roseville and proposed outlets via Alturas and by Crane; Jackson and Josephine Counties I considered as centered at Medford and having a present outlet by Roseville and possible routes via Klamath Falls and Alturas and via Klamath Falls and Crane. It might be more desirable for the perishable products of that section to go northward through Eugene, but that would be slightly more expensive than to haul via Klamath Falls and Crane, and therefore I didn't think it worth while to enter into any cost of calculations by that route. The third division is Douglas County, with its present outlet through Roseville and a potential through Eugene and thence via either Alturas or Crane. And then other counties all taken together, because they all lie around, or north or west of (828) Eugene, so that all their products would move through that point, their products moving through Eugene and thence eastward, either via Roseville, by Alturas or Crane. (829.)

A statement was later received from the Southern Pacific showing cars billed through Ogden from small independent roads in Oregon, and these were all forest products, and I have added them to the cars reported by the Southern Pacific from each county, but I haven't attempted to show them in my tabulations as separate, so these cars of products which appear in Table XI on page 105 include

444 some tonnage handled by the Southern Pacific but not originating on its line. This Table XI, on page 105, gives a statement of the tonnage that the Southern Pacific reported to the Public Service Commission of Oregon, and arranged in accordance with the manner that I have already indicated.

The weights, average weights of loads, are my own calculations. The railway company's statement was of cars and total tonnage. In other words, the figures in the first column of cars were those reported by the Southern Pacific, and in the second column the average weights I have calculated myself. I have made that cal-

culation. It is a purely arithmetical calculation. (830.) There is no element of judgment on my part in this showing of average weights. Referring to page 104, in the first, third, and fourth groups assuming that all traffic which the Southern Pacific moves out of those groups was the same as if it had been routed by the shipper and routed by these various routes, it actually did go, all of it, through Roseville. I assumed that the Southern Pacific operated the whole, operated the cross-State line, and the Short Line down to Granger and east, operated the Alturas route, and the Roseville route, that it moved the traffic, for the purpose of my comparison, by each of those three routes. I compared the costs—I intend to compare the costs of moving it via each of these three routes. Any of these products might have gone by any one of those routes. But I don't attempt to say that (831) is the way it would go. But I will undertake to show what the respective costs of all of this tonnage would be via each one of those three routes.

On page 105 in the column headed "Average weight" those figures refer to the loading in the car. They do not include
445 any of the tare weight. That is the average weight of the load. This traffic statement, or tonnage statement, is divided between eastbound and westbound movement. Forest products furnish the bulk of the tonnage eastbound. The total number of cars of forest products was 22,460. Lane County in western Oregon furnished the largest number (832) of cars of forest products, 5,632, almost exactly one-quarter of the total. Eugene is situated in Lane County. Klamath County furnished the next largest tonnage of the eastbound forest products, 4,684 cars. There is none of this east bound forest products tonnage that couldn't move east via the cross-State line cheaper than by any other route, either existing or projecting. That is what I propose to show a little farther on.

The total number of cars of all revenue freight that moved east, excluding forest products, was 3,532 cars of other commodities. The average weight per car of the loading in those cars of eastbound general commodities was twenty tons. The total number of cars eastbound in the same period between those points was 1,226. The average loading was 16.7 tons. In another place in my exhibit in previous calculations I have used the figure of 17 tons, instead of this figure of 16.7. (833.)

This last item of empty cars at the bottom of this table is simply a matter of loads east less loads west. There moved east in that period from Klamath County 4,684 loaded cars of forest products, 54 cars of other commodities, so that adding 4,684 and 54 I would get the total number of cars that moved east in that period from Klamath County. The westbound movement of empties in Klamath County I compute as the difference between the total loads east from Klamath and the total loads west to Klamath. That is
446 true for the various other counties and for the totals shown. There is nothing more to be said in explanation of this table.

(834.) I do not include anything for tonnage now moved through Portland from this same territory, such as a broccoli. This table here includes nothing but what actually moved in 1926 through Ogden. It wouldn't include any movement through Portland that might move on the cross-State line. That possibly is taken into account further in calculations following this, but this has only to do with what I have called existing traffic, because it did exist during 1926. Traffic to or from points in the Willamette Valley in western Oregon, from and to eastern territories, that is, east of Ogden, would not normally be routed through Portland. The statement of tonnage in Table XI is of traffic that moved through the Ogden gateway to or from points on the Southern Pacific lines in Oregon. Ogden is not on the Union Pacific main line from Portland to the Missouri River. It is south of that. (835.) I would suppose that normally any of the tonnage shown on Table XI, either eastbound or westbound, or a considerable quantity of it might have been routed through Portland if it had been satisfactory to the originating carrier to do it. But if it were routed through Portland, if it was westbound tonnage, or routed through Portland if it was eastbound tonnage, it wouldn't have gone through Ogden. It would have gone through Granger. That is the tonnage that has moved through the Ogden gateway. If that tonnage going east or coming west moved through the Ogden gateway, it wouldn't normally move through the Portland gateway on the west end of the haul. (836.) As to whether broccoli that now moves through Portland would move over the cross-State line if it was constructed, I show that later on, but here I am considering only this existing traffic.

447 Now page 106—that merely mentions the fact that the records of the Western Pine Manufacturers' Association show that in 1926 there were 3,410 cars of lumber went out of Bend through Huntington; there was a little freight received from the opposite direction, but I don't know how much of it came into Bend, so I simply left it out altogether and called it all an empty-car movement westbound to balance that 3,410 loads eastbound. The previous computation I made would indicate that $41.84 on each one of these 3,410 cars might have been saved if the cross-State line had been constructed and they had been routed via the cross-State junction, Crane and east (837), instead of via Huntington. That computation or figure of saving was based on computations appearing on page 85.

Turning to page 107, that is merely introducing Table XII, potential saving on the existing traffic, and in this I haven't assigned empty-car movement to any load separately—I mean to any load specifically, but I have taken the entire empty-car movement and calculated the cost of moving those empty cars westbound. Now, that takes in, then, to Table XII, on page 108, which is the potential saving by substituting the cross-State line for the existing line by way of Roseville and for the proposed line by way of Alturas. The first column gives the origin of the cars, and the next the commodity,

and then the number of cars involved, and then for this purpose here I have merely presented the cost of road haul to or from Granger, for the reason that all cost beyond that point is simply a common addition to every calculation, and it is therefore unnecessary to include it here. The total savings in cost would be made west
448 of Granger. Then in the last columns there is the saving in (838) direct cost compared with the existing route via Roseville, so much per car, and so much total as applied to the number of cars given. And the train for the proposed route via Alturas.

Taking the forest products, from Klamath County, this statement in Table XI shows 4,684 cars; on page eighty of my calculation it is shown that the load from Klamath Falls via Roseville to Ogden costs $103.33; on page 77 it is shown that the cost from Ogden to Granger was $18.93; therefore the cost from Klamath Falls to Granger via Roseville was $122.26.

Similarly the cost from Klamath Falls through Alturas to Ogden, shown on page 76 as $72.98, again the cost from Ogden to Granger, $18.93, gives me a total of $91.91.

From Klamath Falls via Crane, I calculate it first to Chemult, shown on page 78, $8.83, from Chemult to Granger $78.24, making a total via Crane of $87.07.

For a haul from Klamath Falls it is therefore shown that it is cheaper to haul it via Crane to the amount of $35.19 per car, amounting to $164,830.00 on the 4,684 cars so moved in 1926.

Similarly it is shown to be $4.84 cheaper than the haul would be through Alturas, making a total saving possible (839) of $22,670.00; that is, the cost per car of hauling from Klamath Falls via Crane is $4.84 less than the cost via the proposed route through Alturas. The other computations for the forest products from other counties are similarly made all the way through. On page 109 I have total forest products 22,460 cars, opposite some figures over in the last five colums. The figures in the last five columns have no
449 reference at all to this item off to the left, "Total forest products." That ought to have been dropped down a line to show that it referred to something different. Going back to Klamath County, these forest products—these savings are all based on the computations of cost I have made from Klamath Falls itself, the city. For the purpose of this analysis of savings via the cross-State line I am assuming the same cost from all points of origin in Klamath County. (840.)

I believe the great bulk of the production of that county does originate in Klamath Falls. If there were any south of that, it would move through Klamath Falls, and to go east either via Alturas or via Crane, so the comparison of difference in cost would remain the same. If there were any produced at points north of Klamath Falls, the difference in cost would be greater in favor of the cross-State line than is here indicated. As to whether lumber in substantial quantities is produced in Klamath County north of

Klamath Falls there are, I believe, some fairly large points of origination not very far north, and some smaller ones quite a distance north, in Klamath County. The farther north you went from Klamath Falls in Klamath County the greater the savings via the cross-State line would be made to appear.

On page 109 the section where in the second column I have the abbreviation for "miscellaneous," that is the traffic, loaded traffic eastbound, or the traffic eastbound other than forest products originating in these various counties in western Oregon. (841.) The computations of the cost via these various routes, and the savings to be made by the cross-State line in comparison with the existing Roseville route and the proposed Alturas route, are computed on the same basis as those for forest products.

450 On page 108, the last item there, "Other counties, forest products," would include Lane County, in western Oregon. That includes all that great group of counties whose products would naturally move through Eugene. There is a heavy production of lumber in Lane County and the surrounding counties. That is indicated by this movement of 14,810 cars from those counties. (842.) The total savings in money by the use of the proposed cross-State line, as compared with the existing Roseville route, for the movement of those 14,810 cars would be $842,837.00. That is on the basis of some one year's actual movement from those counties through Ogden. That includes Coos County, those "other counties." The saving per car by the proposed route, via the cross-State line, over the now existing route via Roseville, from Douglas County, for lumber traffic would be in comparison with the existing route, $37,540.00 in the aggregate, or $49.92 a car. The saving for these other counties, including Lane, would be $56.91. All those figures in that column would indicate the saving per car either on forest products or miscellaneous traffic. (843.)

On page 110 I have shown empty cars westbound to Klamath County, 4,480. That was taken from Table XI. Explaining the figures there in connection with the empty-car movement westbound from Klamath County, and the comparative costs of moving those empties from Granger to Klamath Falls via the Roseville, Alturas, and Crane routes, respectively, the calculations are just as in the case of the loaded cars; the district over which the calculation is made is given under the head of "Route," the pages indicated on which the cost figure will be found, and the cost figure for each district or part of it is set out in the next column, and the total in the last column under the head of "Road haul." The comparison is made in

451 the succeeding columns. The figure $27.20, being the fourth column from the right at the top of the page, indicates that the cost of moving an empty car from Granger to Klamath Falls, or to Klamath Falls, is $27.20 less than via the existing route through Roseville. The cost of moving such an empty via the cross-State (844) line would be $3.40 less than via the proposed Alturas route.

The saving in empty-car-haul cost from Granger to Eugene, or Douglas County, would be $41.23 over the existing line, and $1,743 over the Alturas line, per car. The total number of empties shown on page 111 that moved west is 24,766. On the one-year tonnage statement I have not added up the total savings on the movement of these 24,766 empties west via the proposed cross-State line in comparison with the cost via the existing route through Roseville. I can do so in a minute. On my report the statement refers to all loads, the loads and empties both. You refer to that line, "Saving on Southern (845) Pacific traffic," do you not? That is all loads and empties, all cars moving. I haven't added the total saving on empties separately. On the movement of 4,480 empties west to Klamath County by the proposed cross-State line in comparison with the existing route via Roseville the saving would be $121,856.00. On the grouped counties on page 11, to which I show an empty-car movement in that year of 15,440 cars, the total saving would be $636,591.00. The figure I have shown a little farther on on page 111 of $2,174,024 represents the total possible saving on the traffic of 1926 if it had been moved via the cross-State line instead of
452 through Roseville, the way it went. That saving would be made up of two items, a lower cost for the loaded haul east, and a lower cost for the empty movement west. Adding those two items of saving together gives the (846) total figure of $2,174,024.00. I have separately computed the saving on loaded movement of 3,410 cars from Bend to Ontario by the Union Pacific, via Sherman, on the one hand, that could have been effected if the cross-State line had been built and that traffic had routed via Crane instead. The total saving on that 3,410-car movement, that is, on the loaded movement east would have been $87,637.00. The total saving on the empty-car movement west would have been $57,970.00. If those two items are added to the total saving on Southern Pacific traffic, the saving over the cross-State line in comparison with the existing route would be $2,319,631.00. I will give the corresponding savings compared to the Alturas. (847.) On the Southern Pacific traffic the saving by the use of the cross-State line over what could have been accomplished by the use of the Alturas line would be $859,781.00; then adding that saving which the cross-State line would have produced on the Bend traffic would make a saving there of $1,005,388.00, altogether.

At this point I want to introduce a memorandum. I have prepared a typewritten sheet that I wish inserted in Exhibit 16 as No. 111–A. I stated in my synopsis of the report that I would show that the net earnings—that there could be such a division of joint rates that the net earnings by the Southern Pacific on the short haul will equal what it could make on the long haul (848) via Alturas and still leave enough for the Union Pacific to make
453 its net earnings per mile greater on the haul from Crane to Omaha than at present from Ogden to Omaha. I meant when I said "the short haul" the earnings to the Southern Pacific

on the short haul, the earnings that the Southern Pacific would get as a division of joint rates for the haul it performed from the origin of the traffic on its line up to Crescent Lake. That is what I mean by "the short haul" or other point of exchange.

These calculations here are applied only to haul from Eugene, where the great bulk of the traffic comes from.

To take a car of fir lumber from Eugene, destined to Omaha, 70,000 pounds, at the freight rate of 62½ cents, $437.50 for the car, the Southern Pacific part of that transaction would be as follows:

Its earnings, $253.75, and its cost of haul via Alturas, as shown on page 73 of this exhibit, $174.40. It would therefore have net earnings on that haul of $79.35.

The Union Pacific would get as its share from Ogden to Omaha $183.75; its cost, shown on page 73, $149.50; and net earning for a haul of 990 miles of $34.25, which is a net per mile of $3.46. (849.)

If that had been hauled via Crane, the cost to the Southern Pacific for the haul to Crescent Lake would have been $48.54. Adding the net as given above, $79.35, the Southern Pacific would have had to have $127.89 out of the total in order to get the same net on exchange at Crescent Lake as it would otherwise have on exchange at Ogden.

There would be left for the Union Pacific $309.61. Its cost from Crescent Lake to Omaha, as shown on page 75, would be $242.36.

Its net earnings for a haul of 1,659 miles would be $67.25,
454 which is 4.06 cents net per mile, as compared with 3.46 cents by the existing route.

Take a car of fir lumber from Eugene, destined beyond Omaha, the freight charge divided by the two carriers for the haul to Omaha would be $385.00. I repeat these calculations, and without going through all of them I have this result, that the Southern Pacific's net on the haul to Ogden would be $49.60, and the Union Pacific for Ogden to Omaha $16.25, 1.64 cents per mile.

By way of Crane the Southern Pacific should have had the same net earnings by receiving $98.14 out of the gross, the Union Pacific would have had less $286.86, and its net on that haul would have been $49.25, or 2.97 cents net per mile. This sheet would indicate that out of joint rates on the same basis as exist now, but made applicable via Crane, the Southern Pacific for its haul up to Crescent Lake might (850) receive the same amount of net earnings as it now gets for turning the traffic over to the Union Pacific at Ogden, and at the same time allow the Union Pacific a sufficient increased amount of net earnings to substantially raise its net earnings per mile for its haul from Crescent Lake to Omaha or beyond. Its haul would be increased to pretty near double, and it would make more net on each mile at that longer haul.

I go next into the question of joint rates intended to produce a result similar to that which is indicated on the page which I have just read. It is quite obvious that the savings made by the use of

the cross-State line cannot all be allotted to the Union Pacific, assuming that it is the company which builds that line, for the Southern Pacific must be compensated for the loss of the long haul.

455 That company is now proposing to build from Klamath Falls to Alturas and to send its Ogden business over this route instead of through Roseville. This route would be 210 miles shorter than the present, although it would still be circuitous, in comparison with the cross-State route. I believe the cost is estimated at about five million dollars. (851.) I mean the cost of the new line via Alturas. That estimate was made, however, at a time when the N.-C.-O., the narrow gauge, had not been standardized, and that cost was estimated to include that. That standardizing has now been done. I don't know the cost of the 100-mile link from Alturas to Klamath Falls. The five million includes the broad gauging of the N.-C.-O.; that is what I understood was the original cost.

Table XII shows that with that line the Alturas line could have saved on the 1926 traffic the difference between these two figures of savings which are given on page 111, which would be $1,314,243.00. The cross-State line, estimated to cost about nine million, could have effected further economies on the same traffic of $859,781.00, and on business to and from Bend of $145,607.00. That business from Bend is business that is now handled by the Union Pacific only.

I did not take into consideration what the Great Northern and Northern Pacific are moving out of there (852) through the Oregon Trunk, by way of other routes, even, than the Union Pacific, because that would not be affected by the cross-State line, unless the building of such a line diverted the traffic away from these carriers, and I haven't gone into that question nor made the assumption that that could be done. I assumed that all the Southern Pacific traffic will be diverted, but nothing from the northern lines. These

456 savings alone will justify the construction of the Crane cut-off and the diversion of traffic through it, even if the Alturas line were already built and in use. The cross-State line is therefore an economic necessity, both to the communities to be served and to the carriers themselves. It involves, however, the diversion of traffic from one carrier to another with loss of the long haul by the originating line, and a plan must be devised which will permit such routing without injustice to either carrier. I recommend the plan which follows:

Recommendation: Let the Union Pacific be required to build from Crane to Crescent Lake within a reasonable time, with the assurance that for a period of three years thereafter the joint rates established for interchange at Crescent Lake will be such as to give the Union Pacific about 85 per cent of the saving over the existing route via Roseville as compensation (853) for its investment, while the Southern Pacific would receive the remaining 15 per cent as an addition to its net revenues, without any additional cost.

Let the order of the commission which requires the building of the cross-State line provide that whenever the Southern Pacific, after the expiration of the 3-year period, completes the line from Klamath Falls to Alturas there shall then be established a new set of joint rates at Crescent Lake, the effect of which shall be to give the Southern Pacific net earnings on freight turned over to the Union Pacific at Crescent Lake equal to those which would be earned by it on delivery of that freight to the same carrier at Ogden, under the joint rates now existing.

457 Let it also be required that the Southern Pacific shall thereafter deliver to the Union Pacific at Crescent Lake all freight which originates north or west of Crescent Lake, or within a reasonable distance south thereof, and which is destined to Ogden or points east.

In order to demonstrate the feasibility of making divisions of rates which will accomplish the results desired, I have assigned certain percentages for such divisions and have calculated the effect of their application to the freight now moving, taking the record of 1926 as its measure.

The computations which follow will show that by this plan (854) both carriers will profit by the use of the cross-State line, and yet that such inducements will be held out to the Southern Pacific to build the Alturas line as to insure its construction within a reasonable time. In connection with the recommendation I have just made, my discussion on this point is based on the assumption that the Union Pacific System lines would construct this cross-State line between Crane and Crescent Lake.

I first take up this proposed 3-year period in which the division of rates is to favor the Union Pacific by a greater amount than would ultimately be arranged for, and I feel with this now first on the basis only of this existing traffic, that is, the traffic which did move in 1926.

I first estimate the net earnings of both lines on the freight now moving via Roseville, and then show the effect on each of these proposed divisions at Crescent Lake on the haul via Crane, and then I make a similar calculation on the basis of the division to be made after the Alturas line is built and in use.

458 Now, the rates which I have obtained to apply here are only those on lumber, but over 80 per cent of all the traffic in question consisted of lumber, and I think that if an equitable (855) division of earnings on lumber can be suggested it would necessarily follow that there could be no difficulty in accomplishing the same thing on other commodities. In these calculations now in order to apply rates I have again gone back to the method of applying the 60 per cent ratio to each loaded car movement, instead of treating them separately as in the Table XII just completed, and for that reason, since the actual ratio of empties to loads was about 95 per cent, instead of 60, on that movement, the savings which I will show

in the succeeding tables do not equal in total that which appears in Table XII. I don't think that higher ratio is a normal one. I think that with the establishment of a more direct route through here that conditions will come to be more nearly as they are on other routes. I therefore take that 60 per cent ratio. I take up—well, let's see the rate that lumber from Eugene to Omaha is 62½ cents, of which the Union Pacific takes 42 and the Southern Pacific 58 per cent. On the rate from Eugene to points beyond Omaha, 55 cents is assigned to the haul to Omaha, and the two carriers divide it in the same proportions.

I take up in my first consideration the fir lumber from Eugene, and consider first a car destined to Omaha, having 70,000 pounds, and a total charge of $437.50. On that basis, on the basis of the division as now made, the gross earnings of the Southern Pacific would be $253.75, the direct cost $222.90, the net earnings for the 1,134-mile haul $30.85. (856.)

The Union Pacific, receiving $183.75, with a direct cost of $149.50, would have net earnings of $34 25.

459 Now, I suggest a division of 17 per cent to the Southern Pacific on this rate. In that case the Southern Pacific would receive for the gross earnings from Eugene to Crescent Lake $74.38, while the direct cost would be $48.54, a net earning of $25.84, for 96 miles, which would show a decrease in the net of $5.01 under that division.

The Union would receive for its gross earnings $362.12, at a cost of $242.36, a net of $120.76, or an increase in its net earnings of $86.51.

The figure of 1,659 miles is the distance from Crescent Lake to Omaha.

A similar calculation follows on a car of fir lumber destined beyond Omaha, where the total earning is $385.00, the gross earnings of the Southern Pacific from Eugene to Ogden $224.00, and its cost $222.90, leaving it a net earning of $1.10, for a haul of 1,194 miles. Now, for the Union Pacific, its gross earnings would be $161.00, and its direct cost in this case somewhat reduced, since it would cost less in interchange than for delivery to a consignee—its cost $144.75, and its net earnings $16.25. (857.)

Now, if that were hauled by way of Crane, the Southern Pacific, receiving 17 per cent, would get $65.45 at Crescent Lake, and its cost would be $48.54, its net earnings $16.91, or an increase in its net of $15.81.

The Union Pacific would get $319.55, at a cost of $237.61, or a net earnings of $81.94, an increase in its net earnings of $65.69.

Take next a car of pine lumber from Klamath Falls, 51,000 pounds, at 62½ cents, $318.75. Under the present haul,

460 Klamath Falls to Ogden, the Southern Pacific gross earnings, $184.88, direct cost $170.10, net earnings $14.78.

Union Pacific gross earnings, Ogden to Omaha, $133.87, direct cost $145.02, net loss in 990 miles, $11.15.

I suggest that on an interchange at Chemult of freight from Klamath Falls the Southern Pacific be given again 17 per cent of the joint rates. The Southern Pacific would then have for the haul from Klamath Falls to Chemult $54.19, at a direct cost of $28.85, net earnings of $25.34, an increase in its net of $10.56 per car.

The Union Pacific would have for its gross earnings $264.56, at a direct cost of $234.86, net earnings of $29.68, an increase in its net earnings of $40.83.

If this car of lumber were destined beyond Omaha, the gross earnings of the Southern Pacific under the present route would be $162.69, direct cost $170.10, net loss $7.41. (858.)

Union Pacific gross earnings, Ogden to Omaha, $117.81, direct cost $145.02, net loss $27.21.

If it went by Crane, the Southern Pacific would receive at Chemult $47.69 on the same 17 per cent division, at a direct cost of $28.85, net earnings of $18.84, an increase in its net earnings of $26.25.

The Union Pacific would have gross earnings of $232.81, at a direct cost of $230.13, net earnings of only $2.68, but an increase in its net earnings of $29.89. (859.)

Next on line lumber from Medford to Omaha, a car of pine lumber destined to Omaha, 56,000 at 62½ cents, $350.00. The Southern Pacific gross earnings from Medford to Ogden $203.00, the direct cost of $189.46, net earnings of $13.54; Union Pacific gross
461 earnings from Ogden to Omaha of $147.00, a direct cost of $146.78, net earnings of 22 cents. If it were by Crane, I would recommend that 24 per cent of the joint rate be allotted to the Southern Pacific. It would then receive $84.00 at a direct cost of $72.10.

These pages are indicative and representative of the calculations I have made and the illustrations I wanted to give of the recommendations I had to offer on joint rates, the division of joint rates. (860.) I think probably there have been enough read. On page 117 I check up the division proposed after the construction of the Alturas line.

On page 115, as to whether the Union Pacific is only earning 22 cents for a haul of 990 miles, it is practically an even break; not making anything at all on those little loads of pine lumber hauled over those long distances at these rates. My proposal in substance would mean that the Southern Pacific would make more money for the shorter haul, that the Union Pacific would make more money out of their longer haul, and that the shippers would get the benefit of the short route by quicker movement and the better service that would naturally accrue to them and that there would be no loss to anyone. (861.)

For the Alturas line I have assumed that the existing rates and divisions of rates at Ogden would continue, if the traffic moved via that route, and I present another set of similar calculations with a proposed joint rate arrangement intended to give the Southern Pacific the same net earnings on the short haul to Crescent Lake

that it would have if it hauled it through Alturas to Ogden, and then I leave the Union Pacific to make the balance of the saving as its increased net earning as compensation for building the
462 cross-State line. In this consideration, after the Alturas line is built and the joint rates are made on that basis, I do not calculate on any freight from Klamath or Jackson Counties, because that freight could not be divided on the basis proposed of protecting the Southern Pacific fully in its possible net earnings by way of Alturas. I therefore leave it out of the calculation, assuming that the Southern Pacific will take all of that by Alturas. I likewise omit fir lumber going to Utah and consider that that would move through Klamath Falls and Alturas, although there would be for parts of its at least some saving made by hauling it through Crane and Pocatello. (862.)

The results of these calculations just gone over are shown in Tables 13 and 14, where I summarize the net earnings of both carriers under both these sets of rates.

Table 13, at the bottom of page 119, gives the total increase in net earnings of Union Pacific on account of the cross-State line; the figure is $1,805,880; and on Table 14 the net earnings of the Southern Pacific, on the same traffic, $298,761. The figures I have just given are figures for the savings in one year, assuming that the traffic was the same as that actually moved in 1926, as shown by my Table 11. This takes into account the savings via the cross-State line to either or both the Union Pacific and Southern Pacific; this includes westbound traffic as well. This covers all of that traffic which was shown by Southern Pacific statement to have actually moved in 1926 through Ogden. (863.) Neither of these tables of savings shown takes into account traffic originating in Idaho and moved west over the cross-State line, or originating in Oregon and moving into southwestern Idaho by the cross-State line, or anywhere in southern
463 Idaho. I assumed that no such traffic would have passed through Ogden; therefore would not be included in these figures.

In Table 15 I show the net earnings on this 1926 traffic by the proposed routes for the Union Pacific and for the Southern Pacific both, on this basis of division of rates intended to permit the Southern Pacific to make as much as though it hauled the traffic through to Ogden. Those figures for the Union Pacific are $715,340, and for the Southern Pacific $18,317. That figure, however, merely represents the fact that the Southern would be fully protected on the basis of the figures which I have given here; that is, that according to this division and on this traffic it would have made actually $18,000 more than if it had hauled it through Alturas to Ogden. Perhaps a little more explanation might help there on that.

And in all of these tables I presented the earnings of these carriers both by the present route and by the route proposed to be considered; that is, in the first part of Table 15, if (864) the Union Pacific were to receive this traffic, all of it, at Ogden, it would make

$393,801 of net earnings, while if it received it at Crescent Lake it would make $963,534, plus the saving that could be made from Bend of $145,607, leaving it an increase of net earnings by virtue of the cross-State line of $715,340, whereas the Southern Pacific, if it hauled it through Alturas to Ogden, would make $1,035,196, and if it interchanged it at Crescent Lake instead would make this figure of $1,053,513, showing that these rates do or would fully protect the Southern Pacific. It is the intention that it would not suffer monetary loss by diversion of this tonnage from its Roseville route to
464 the cross-State route under the basis of dividing joint rates as I have suggested—a compulsory diversion of the traffic under rates which would fully compensate the carrier who is compelled to divert it, from whom it is taken. Those results as shown in those last three tables are not based on the assumption of any increased tonnage over the actual movement in 1926 that I showed in Table 11. These calculations have been made chiefly for the purpose of obtaining figures of earnings per car, and also to show the extent to which the existing traffic line would support the proposed line. (865.)

Now in coming to the estimation of the total earnings which the Crane cut-off might make, I assume that this 1926 traffic, that is, an equal volume of it, is going to continue to move.

Exam. ROGERS. Before you come to that, Mr. Newell, I don't know whether I can ever understand all of this or not, but the thought just occurred to me and I would like to see what you think of it: I have in mind that in several of the cases the carriers have used a figure of around three mills per gross ton-mile for haulage costs. I was wondering if you could take that figure as a starter and apply it to the tonnage and to the decreased mileage and get a figure which would be comparable with your savings that you set up in your exhibit.

A. I can apply the figure—did you say at three mills per gross ton mile?

Exam. ROGERS. Yes.

A. Was that intended to be applicable to the roads of this western district? I do not know at all off-hand whether that represents a fair cost figure for this district or not.

Exam. ROGERS. I am not certain about this, but I think that was used by the Santa Fe and the Southern Pacific.

A. Well, without expressing any opinion as regards its applicability from a cost standpoint, I would be glad to make
465 you the calculation and show you the results, whatever they may be.

Exam. ROGERS. All right. The question would be whether (866) three mills was the proper amount to apply.

A. I do not know whether that is the average cost.

Exam. ROGERS. I say that would be the question, wouldn't it?

A. That would be the question; yes. Of course if that were too low a figure, for example, all these operations by the Southern Pacific would show a higher net earning than they ought to, and consequently a division of rates to give them a shorter haul would require for them a larger compensation, leaving less out of it for the other carrier. That is the way it would distort the results, if that were the fact.

Exam ROGERS. Go ahead.

The WITNESS. How far did I get?

Mr. MCCULLOCH. You had just started to discuss the estimated earnings of the cross-State line.

The WITNESS. Oh, yes.

466 Well, I figure that this 1926 traffic will continue to move in the same volume in itself, and that the timber of western Oregon will continue to move to eastern markets by rail, whether shorter routes are provided or not, and, therefore, it is proper on the future as well as the present lumber traffic to credit the entire increase in net earnings to the Union Pacific because of this short route, and, third, that the estimated increases in traffic from western Oregon other than lumber and the westbound traffic expected from eastern Oregon and southwestern Idaho, ought to be (867) calculated at some rate less than the preceding.

Now as to the amount of earnings to be credited to this traffic I am depending entirely upon a later witness, Mr. Wiggins, who has prepared estimates and will present them as exhibits here of those earnings. I don't put them forward as of my own knowledge at all, but I use them here for the purpose of making the presentation clearer than it would be if I waited for him to put his figures in first. What I have calculated myself in this is the cost of haul.

Mr. Teutsch has already presented his exhibits in this case, and some of what I put in here is merely explanatory of his own work. It is not necessary to repeat it. I have tabulated his data in a form convenient for my own use in Table 16, which begins on page 124.

I have dealt here only with the carloads, ignoring the tonnage, because my calculations of cost are made by the carload; and in that table I have undertaken to find out how much more traffic Mr. Teutsch estimates in these years than was actually moved in 1926, for the reason that I wanted to treat the two separately, having
467 already obtained figures applicable to the 1926 traffic, and for that reason I show them in the form that I do where they are tabulated in the first part of Table 16, showing from each county Mr. Teutsch's total estimates of carloads of fresh fruit, and then subtracting from that the amount which actually did move in 1926, the difference (868), not stated in the table, being the figure which I want for my own use.

The table, I think, needs no other explanation. It speaks for itself. The first part of it is of the tonnage going out from the counties named eastbound, then the westbound from certain counties

and to certain counties, that is, from certain counties without regard to the destination, and others to certain counties without regard to the point of origination, the only thing of interest here being that it would pass over the cross-State line.

There is a little duplication in these figures, as the wheat of Malheur and Harney Counties is here assumed to make a part of the feed which is used in the western Oregon counties, and, therefore, it is not included in the totals. That applies in the tables of other years.

I have given here these estimates on the basis of the first year, the third, the fourth, and the fifth, it being assumed that the traffic of the second year would be the mean between the first and the third, but that in the fourth and the fifth years there would be no traffic moving over the cross-State line from Klamath County or from Jackson or Josephine Counties. There would be included feed into Josephine and Jackson Counties on the assumption that that would move if originating on the cross-State line or east of there, would move through Eugene and thence south, so that the cross-
468 State (869) lines would get the haul on it; but for products going out of those counties eastward it is assumed that they would then move through Klamath Falls and Alturas.

In a later exhibit I shall be able to show an estimate of the earnings which would come from the traffic westward out of Idaho, and I hope we shall be able to get one prepared in time for a similar showing of what is expected to go into Idaho, but that is going to depend, so far as I am concerned, chiefly on Mr. Wiggins, and I don't know whether he is going to have time to get it in conjunction with the Idaho people or not. As to Jackson County, 2,473 cars, in re using fruit crop out of Jackson County to move through Eugene and over the cross-State line would say that was Mr. Teutsch's estimate of what could move that way. I didn't understand that that figure was conditional on the Butte Falls line at all. He didn't so represent it to me. I think that covers all of Table 16. That is merely putting (870) Mr. Teutsch's estimate into shape for the application of my own cost figure further on. Now I take up next the expected increase in lumber shipments.

The Southern Pacific lines in Oregon serve a territory that is equal to the area of the State of Ohio. Practically all of the tonnage on that area must pay tribute to the Southern Pacific in some form. That territory contains about 300 billion feet of standing timber, which would make 11 million carloads. A large part of this 300 billion feet of standing timber in Oregon is practically all tributary to and dependent on the Southern Pacific for rail trans-
469 portation to markets. The Southern Pacific is the nearest road to nearly all of it. A good deal of it hasn't any rail service at all yet, and it is not required that it should have, but it all lies within the territory that might be considered as the Southern Pacific's natural territory. The Southern Pacific's approximate an-

nual traffic in lumber now from western Oregon is around 75,000 cars of lumber and 125,000 cars of logs. Now continuing (871) with the timber resources of Oregon. Well, this map is intended more as an illustration than anything else to show the location of the timber of the State, so far as it affects anything here concerned. There is some timber in the northeastern part of the State, and a little possibly in the extreme southeastern, which is not shown on this map because it is not of any interest in this case. But these figures represent the best figures obtainable from the assessors of the various counties as to the timber in those counties upon which the owners are paying taxes. It has been compiled from different sources. Some county assessors have better information than others, but it is, all of it, obtained from that source, so far as privately owned timber is concerned. I did not prepare this map myself, but it was done in my office and under my direction. I gave the directions for its preparation. It was done by one of my employes.

(Said map was thereupon marked "Exhibit No. 17, Witness Newell.") (872.)

A source of information as regards standing timber in national forests was obtained from the national forest records here in Portland. It is not quite clear on this photograph, but it is clear upon the large map here, a difference in color of the stars. All the green stars there which are shown by a comparatively light color
470 on the exhibit are indications of timber in national forests, while the red stars on the big map, or the dark stars on the exhibit, the darkest ones, indicate privately owned timber. And this map purports to show the proper amount of timber in each township as accurately as it can be done in this manner. Each of these stars represents 50,000,000 feet of standing timber.

There are about sixty-eight hundred stars on the map. I haven't my note here of the exact number. It is about that, representing about 340,000,000,000 feet of standing timber. (873.) I should correct that. This timber out here in the eastern part, the central part of the State, is of course not tributary to the Southern Pacific—not intended to be represented as such; but there is about 340 billion feet, all told, shown on this map. The timber on the east slope of the Cascades, north of Bend, is not considered tributary to the Southern Pacific. There is 340 billion shown here in stars; 300 billion of it lies in the territory which is generally considered as Southern Pacific territory. There are other roads, like the Oregon Electric, which come into it and which can serve it, of course.

I haven't undertaken to show on this map, Exhibit No. 17, by stars, all of the standing timber in (874) the State of Oregon. That is estimated at about 400 billion feet.

This map is intended chiefly as an illustration showing the density of the timber and its location in different parts of the territory, and also the magnitude of the traffic question involved here. I have

shown on this map the location of the present line of the O.-W. R. & N. from Ontario to Crane. That is indicated by the heavy
471 black line on the right-hand part of the map. The solid red line from Crane over to Crescent Lake is the proposed cross-State line. The broken red line is an alternative route via Bend. The Southern Pacific Company's main lines in western Oregon are shown by heavy black lines to make them more conspicuous. My thought was that the Union Pacific, the O. S. L., would operate between Bend and Crescent Lake also. There is joint use by the Union Pacific, that is (875), the O.-W. R. & N., and the Oregon Trunk, of part of that line into Bend, especially the part where you enter Bend. There is joint use from Sherman at the mouth of the Deschutes River up to Bend. There is no joint use beyond Bend to Klamath Falls.

My assumption is that if this scheme were carried out that would be a natural thing to follow, would be a joint arrangement in there. Therefore I have not considered any haul through there as a two-line haul. As to where the terminal would be at Bend, that would be a question rather of operation. I would assume—I would consider it necessary for the purposes which the Oregon Commission desires here, that if this broken red line were adopted and it was built to Bend, that there should also be a cut-off, as indicated by the broken red line, into Crescent Lake further south than Bend, so that the route across the State might be through Bend, then southward, and then by that shorter line to Crescent Lake instead of going on south and around that triangle, and that that would be—the operating division would extend to Crescent Lake; that that (876) would be the operation of the Short Line or the Union Pacific.

As to how general or widespread the distribution of lumber was from Southern Pacific points in Oregon throughout the United States, their statement furnished us shows that lumber went
472 from Southern Pacific points in Oregon by rail in 1926 to every State in the Union, except Washington, and it went by way of Ogden to every State save five. I stated there in the text that 22,000 cars in 1926 took this route via Ogden to various eastern markets, as shown by Table 12, but evidently in making that statement I omitted to add in this later small amount of traffic received from the smaller roads, so that—no; I guess I did get that in; about twenty-two thousand.

As to the principal present sources of supply of softwood lumber in the United States, would say the Southern States and the west coast, chiefly the Northwest (877) Coast States, including Idaho. I have collected some information on the subject of production at present, and the probable trend of production in the future, in those two producing territories of softwood lumber, that is the Southern pine States on the one hand and the Pacific Northwest on the other.

It is not made from my own knowledge, but from collection from statements by authorities; and I have here what is headed as "Mr. Dunham's estimates on production," Mr. Dunham being the industrial engineer for the Southern Pine Association, and he gives estimates of production of pine lumber in the South. The trend of those estimates is a very distinct downward tendency, which would indicate that in the course of a few years that territory must naturally cease to export any great quantity; that is, its production would not be much in excess of its own needs. This estimate was made in 1924. The figures are stated by Mr. Keith to have been accurately checked—I mean to have proven accurate for 1925 and '6 and '7. (878.)

As to an investigation to show imports of softwood lumber
473 into various States and regions of the United States, I took the figures shown by the National Lumber Manufacturers Association in a book which they published in 1925, and which covered the distribution of softwood lumber for the country in 1923. I have not been able to find anything of later date that covers the ground with anything like that completeness. That shows the figures which are given here as Table 17. That indicates a widespread and general distribution of fir lumber throughout the United States. That indicates a growing—indicates that it had even at that time become fairly widespread. The largest territorial distribution of Douglas fir lumber for that year was California, the Atlantic States as a group would be the next largest, as given here in this table. The following table, entitled "Exports of lumber to other States and countries," shows of the producing States how much they used and how much they exported, exported here being used in the sense of exporting to other States, not foreign. Going back to the upper part of Table 17, the total imports for the year 1923 of fir lumber into these (879) various States and consuming localities were 5,600,000,000. I have not put anything in here as to the amount of present timber in the South, standing timber. I have data on it in my files, but not here. I have shown on page 128 approximately one hundred twenty-seven to one hundred thirty billion feet of standing timber in the South at January 1st, 1926. That was Mr. Dunham's estimate. On page 128 that was Mr. Keith's estimate. And for the same date the corresponding amount of standing timber for the State of Oregon would be more than 340 billion feet—altogether, about four hundred billion. That is the figure (880) commonly accepted for the
474 State of Oregon. There are varying estimates in regard to that. That is the State forester's estimate. There are other estimates that put it as high as five hundred billion. The figure of standing timber in Oregon at the present time lies somewhere between 400,000,000,000 and 500,000,000,000. This is as compared with 130,000,000,000 in the Southern States.

As to the consumption of softwood lumber in the United States at the present time and the probable trend of consumption in the future, the figures show that there is a tendency to decrease in the consumption of timber in spite of the increase in population. I

would anticipate that as the Southern timber disappears from the market and it becomes necessary to rely to a greater extent than at present on Western supply, that that tendency would likely be accentuated because of the cost of the long haul. So that I would look for future consumption to be less than that of the past. I have made estimates of future consumption in connection with my investigation, but confining myself only to certain states which (881) are named here, and named because they must depend upon other States for most of their lumber and must get it by rail; and for those States I have assumed that their consumption would be 15 per cent less than their actual consumption in 1923, that is, their consumption at whatever time the South ceases to export; so that the effect of the long haul in diminishing per capita consumption would have reached its full effect. I say Table 18 contains this estimate of mine of annual imports of lumber by rail from the Pacific coast when the South ceases to export. I do not know when that will be. It can't be very many years in the future, but it is quite likely that it will taper off gradually; that the decrease,
475 while rather rapid now, may not be so rapid in its exports in the future, so that it will taper off gradually; but certainly it can't be many years before it comes down to a point where it will have no very great influence on the market. My judgment respecting the trend of production and shipment of fir lumber in the Pacific Northwest to consuming markets in the United States is that it must increase. There is no other source of supply known, or at least none that is available at all. This territory has the greatest amount of standing timber that can be found (882) anywhere now, I believe; certainly the greatest amount that can be found anywhere in the United States.

These States which I have named here, I would estimate, are going to have to use about eight billion feet of lumber per year, that being about a billion and a half less than they did use in 1923, and gradually they are going to come to the time when they must get the greater part of that from this coast.

Now Oregon seems to be the natural source of supply for timber to go out by rail, because Washington has so many of its mills where they can take advantage of water shipments, and they therefore would naturally, where they can, ship by water, because it is an advantage to do so, and particularly the part of the territory most nearly confined to the Southern Pacific, as its outlet is too far from water to take advantage from that to the same extent that they can with the Washington mills; so that I think it is not unreasonable to figure (883) that Oregon ought to furnish about 40 per cent of that eight billion feet when that time comes
476 that they draw it from this coast. Now that would amount to about 150,000 cars a year, and, as far as I can judge from the origination of lumber by the different roads in this State, we are sending out less than fifty thousand cars a year now eastward by

rail. So that here you have at this end of the line the greatest body of standing timber in the world and eastward from it a market that ought to have eight billion feet a year. To furnish a half of it from the Oregon mills will require an increase of 200 per cent over the present movement—I should think within the next ten or fifteen years. I am not basing any of my calculations, however, on the certainty that it would occur within such time. It is a situation that we are approaching. I think it is inevitable at some time not very far distant. Constructing this cross-State line will shorten the existing routes into the market by 400 miles, and will make Oregon the nearest source of supply to the greater part of that market. I think these conditions I have just mentioned point to a considerable increase in production and shipment of lumber from Oregon within the next few years. And I am interested, however, only in so far as they may increase this movement out of central Oregon (884), or western Oregon, rather, where it might pass over the cross-State line, and I have assumed, and I have estimated there, that the next five years ought to see a 50 percent increase in that traffic, provided the improved facilities are furnished, if the cross-State line is built. That increase would amount to about 14,000 cars more than have been moving; and it is on that estimate that my calculations of future earnings for the cross-State line are based.

I think that covers timber and lumber.

477 It Table 19 I have collected all of these foregoing estimates. It includes for the first year, under the head of "Traffic diverted," that traffic already moving, that is, the 1926 traffic, and the earnings per car set up there opposite each car are the increased net earnings to the Union Pacific under this proposed division of rates which I have suggested; so that, as far as those figures are concerned, that is a repetition in that table of what appears previously in Table 13.

The second part I have named, for the lack of any better (885) name, "Traffic created," meaning by that this traffic which Mr. Teutsch has estimated will be ready to move over this line, in addition to similar traffic, or as entirely new traffic where none now exists at all. The figures in the second part of this Table 19 for the first year are taken from Table 16 of the first year, and the figures given of dollars for each car are the cost of haul of those cars over the portion of the cross-State line indicated, and the total is the total cost according to the number of cars. When I say "cost of haul" I mean direct cost only. That is given both eastbound and westbound and gives me a total cost, direct cost, for the first year traffic of that kind, of $149,334. Then the exhibits which Mr. Wiggins will present will show the gross earnings which he considers should be credited to that traffic and the net earnings then are found by taking the difference on that traffic, $134,996, which, added to the $1,805,880 of the first part of the table, makes total

net earnings of the cross-State line on the Oregon traffic of $1,940,-876. The figures for cost of haul under this computation traffic created, include everything, that is, empty-car haul as well
478 as loaded movement. (886.) I haven't shown similar information for the second year; that is because I consider that would be the mean of the first and third years.

Regarding the result I anticipate for the third year, taking that increase which I had estimated on lumber, I have for the first part of the table $2,204,831, and for the figures as estimated by Mr. Teutsch a direct cost of $197,238, gross earnings from Mr. Wiggins' $352,883, leaving a total net from all sources of $2,360,476.

I did not assume in this first table, or rather, the first year, that the majority of this traffic would move the entire distance from Crescent Lake to Crane; that is 180 miles. It is indicated according to the country in which it originated. You will observe there that of this traffic created there is in the first year fresh fruits moving from Cross Trunk Junction to Crane. I would consider that as coming from Medford through Klamath Falls. On this traffic that is created I did not include any increase of revenues on any other (887) haul. I didn't know just how we ought to get at that. I didn't want to overestimate it; so what Mr. Wiggins and I agreed to do was to obtain, as he will show, reasonable rates in accordance with existing rates, which he will quote for the entire length of the haul, whatever it might be, was anticipated between the point of origin and the point of destination, and then attribute to the portion of the cross-State line over which that traffic moved a per mile proportion simply of the total gross earnings, and in that way he obtained those gross earnings which I have used here. That takes no credit, therefore, to the cross-State line for whatever might be earned on other parts of the system over which the same freight would move.

479 Exam. ROGERS. That may be clear, but my point is this: You originate tonnage on the cross-State line by reason of the cross-State line that does not now move, and we will say that that tonnage moves over the Union Pacific to Omaha; it seems to me that the Union Pacific would be profiting by additional revenue off of the cross-State line, and also the additional revenue for the haul from Ontario to Omaha.

A. That is true, but I thought it would be quite a difficult matter to substantiate any estimates made because of uncertainty as to the points of destination, how far it might be hauled, and I thought it better for this case to leave that out of my consideration and be under rather than over in the amount of revenue that ought to be attributed to this line. (888.)

Mr. SPENCER. Well, you would not add anything to the earnings of the Union Pacific Railroad Company in any event, even if it made it, on business originated by the cross-State line, would you?

A. I have not done so as regards this traffic.

Mr. SPENCER. I know, but you repeated several times that you wanted to be under rather than over; the earnings of other railroads haven't anything to do with it.

Exam. ROGERS. My illustration might have been put just as well off of the Oregon Short Line, Ontario down to the junction with the U. P.; and I take it your answer would have been the same?

The WITNESS. Yes.

I estimate that the cross-State line when built will originate tonnage that will move over the Union Pacific system lines east of Crane, the present Union Pacific lines east of Crane. I have not relied on any earnings, gross or net, that the Union Pacific
480 system lines might obtain from such tonnage that they haul which originated on the cross-State line, anywhere in my study or report. Let me make that clear now so there won't be any misunderstanding as regards this lumber traffic, this which I have called "traffic diverted": On that I have credited to the (889) cross-State line the increased net earnings accruing to the Union Pacific system through that haul regardless of the question of any intent to allocate them especially to any part of that haul; that is, if on the haul from Crescent Lake to Omaha the Union Pacific would have a net earning $50 greater than on the haul from Ogden to Omaha, I have credited the cross-State line with $50 for
481 that car as the increased net earnings. In doing that I would simply claim for the credit of the cross-State line the Union Pacific's opportunity to handle the traffic eastbound over its lines more economically by the cross-State route than by its present routes. But I have credited the cross-State line there with the full amount of the increased net earnings. (890.)

Going back to Table 19, in the fourth year, according to the plan which I have suggested, all traffic through Klamath Falls to Crane and Crane is eliminated, and a different scale of joint rates to be introduced, giving the Union Pacific a lesser share of the total rates than for the first three years. There is, therefore, a marked reduction in the total net earnings attributed to the cross-State line, both on the traffic diverted and the traffic created. That will be on my assumption made here of the Alturas line being put off three years, three years later than the date of the completion of the cross-State line. As to whether, if the Alturas line is completed next May, that would rearrange all of this, I go into that further on, but that all came up after this was all prepared and in print, or in fact it was not in print but it was beyond correction at least and change. The (891) net earnings, therefore, drop down from $2,360,000 for the third year to $1,340,000 for the fourth year, and amount to $1,238,962 for the fifth year.

Under the head of "Passenger expenses and earnings" I have no comment to make. I think that is sufficiently covered by the exhibit. My purpose was just simply to put in the small amount of passenger business and expenses to balance it, showing practically no net earnings arising out of it. I am not relying on passenger

earnings in any way to justify the construction of the cross-State line, only figuring they will probably (892) pay for themselves.

482 I have to estimate indirect cost of service on the cross-State line, and I do it on lines pretty fully indicated here in the text by a comparison with the indirect maintenance of way expenses, freight and passenger, as shown by my studies of the O.-W. R. & N. and of the Oregon Short line. On page 131 that is what the Union Pacific would have to bear if it acquired the right to use the Oregon Trunk line from Bend to Chemult in order to make these connections and operate trains to a direct connection with the Southern Pacific, instead of having to depend upon an exchange of traffic with the Oregon Trunk, making a three-line instead of a two-line haul.

As to Table 20, that is simply a collection, in tabular form, of the figures which precede it, the net earnings of freight being taken out of Table 19 and those of passenger and indirect expenses and taxes being estimates in the text immediately preceding it. (893.) The figure return in the last column is the difference between the net earnings from freight and passenger service, less the indirect expenses and taxes. In the next paragraph on page 140 I have called attention to certain other sources of traffic. I have nothing else to say on those. I have not attempted any estimates of tonnage, or number of cars that this other traffic, either Coos Bay traffic or the Alkali Lake traffic, would amount to. I do not know what they would be.

Referring to the paragraph headed "Investment and return," the estimates which were presented to the commission in the former hearing on this subject in 1924 put the cost of this cross-State line at $8,318,842 for the 171 miles from Harriman to Odell Junction. Now the conditions have somewhat changed since that time.

483 The crane branch has been extended to Burns, shortening by a few miles the construction necessary at that (894) end of the line, and the Natron cut-off location has been changed, adding some necessary construction at the west end, so that it would now be necessary to build about 10 miles more of road than originally, and that would be somewhat more expensive than the average of the remainder; so that I have raised Mr. Abry's estimate to a total of $9,000,000. The investment in the Oregon Trunk line has been estimated at $908,000, and the total estimated return and the per cent return on the investment for each year are given in the text here. That would make the cost for 181 miles of road about $49,000 a mile, approximately. As to what sort of a line that estimate of cost would contemplate, my recollection is Mr. Abry estimated this on a basis of 90-pound rail. I intended to look that up before I reached this point, but we got to it a little sooner than I anticipated. (895.) That estimate would hardly be comparable to the best main line construction. That would not be called for on the line over there, that would have but moderate traffic to begin with. It would be rather what you would call secondary main line, or a good branch line construction, capable of handling the amount of traffic that is considered

that. The location calls for only an eight-tenths per cent grade, and the country is not such as to require very sharp curvature.

Mr. McCULLOCH. I would like to ask reference at this point to an excerpt from the testimony, in docket 20415, State of Idaho on the relation of the Public Utilities Commission of Idaho against the Oregon Short Line Railroad Company, and others, hearing at Twin Falls, Idaho, April 3rd, 1928. R. Whipprecht, department auditor in the accounting department of the Oregon Short Line Rail-
484 road at Salt Lake City, gave the figure for the cost of the Wells-Rogerson line, the actual amount invested in it as of December 31, 1927.

Mr. SPENCER. I will give you that, if you haven't got it there.

Mr. McCULLOCH. He gave the figure as $3,434,262. Thank you. (896.)

Mr. DAY. How many miles? Is that the entire cut-off?

Mr. McCULLOCH. That is the entire cut-off; yes. The distance is about 95 miles or 97 miles. I will supply the exact figure.

Mr. SPENCER. 94 miles.

Mr. McCULLOCH. 94 miles. I will take Mr. Goodwin's statement.

WITNESS. I am not familiar with the present construction from Ontario to Burns. I haven't seen very much of it. I have not made any computation of the running time that might be expected from Crescent Lake to Ontario of the ordinary freight train.
485 This figure of approximately nine million dollars for the construction of the line includes sidetracks, passing tracks, station buildings, water stations, the various facilities that have to be provided for the operation of a railroad.

As to an alternative proposal, if the Interstate Commerce Commission should hold that this division of rates which I have proposed after the (897) first three years ought to be established whenever the Alturas line is built, I was not going to say anything except what was printed in the exhibit. I notice that it would not be perhaps quite clear, the basis of the calculations here in Table 21. They would not only exclude Klamath, Jackson and Josephine traffic, but they would put the division of joint rates on that scale, which would be lower for the cross-State line than the other; that it, the same that I proposed at the end of the third year; and the results in earnings are indicated on page 142 and collected together in Table 22. (898.)

Supposing the Alturas line is to built right away and to be completed and put in operation by May, 1927, that would not change in any way my testimony and the results of my study, or tend to change my opinion as to the justification for the construction of the cross-State line that I have outlined in my analysis of cost and study here.

The last topic I have mentioned in my report is the alternative route via Bend. I think what I have stated is as completely as I could give it. In a cross-State line from Crane to Bend there ought to be provision for a connection from some point on the Great

Northern south of Bend over to Crescent Lake, in order to give the service that the traffic will ultimately demand, and my comparisons are based on the consideration that that piece of line is built
486 immediately; otherwise the cost of haul by that route would be greater than as indicated here.

On the next to the last line on page 143 I say "these figures justify the seiection of the cross-State line as the preferable route." I mean by the "cross-State line" the (899) more direct line from Crescent Lake to Crane, the original Harriman line, so called.

In Exhibit 16 I have either personally made all of the calculations and prepared the data and information shown therein, or it has been done by employees of mine under my direction. I believe it to be true and correct.

(Exhibit No. 16, witness Newell, was thereupon received in evidence.

Pages 65 to 76, both inclusive, of pamphlet entitled "Rate Structure Investigation, No. 17000—Part 7, Grain and Grain Products, Exhibit of Public Service Commission of Oregon, Transportation Cost Study, by J. P. Newell, Consulting Engineer," was thereupon received in evidence, marked "Complainant's Exhibit No. 16–A, Witness Newell."

Map, marked for identification "Complainant's Exhibit No. 17, Witness Newell," was thereupon received in evidence.) (900–901.)

486½ [File endorsement omitted.]

487 JAMES C. PALUMBO was thereupon produced as a witness on behalf of complainants, and having been first duly sworn testified as follows:

I live at Payette, Idaho. I am engaged in the fruit and produce business. I have been engaged in that business at Payette five years. (902.) Prior to that time I was engaged in that business in Indiana for twenty-three years. Altogether I have been in the fruit and produce business for twenty-eight years. At the present time at Payette, Idaho, I have a number of warehouses. I have several pieces of property of my own, I am building a new cold storage, nearly a hundred thousand dollars worth. The capacity of that cold-storage building is two hundred cars to be used for apples. That is being constructed at Payette, Idaho. In addition to that I own an orchard. I handle fruit as a producer and also on the commission basis in that community. (903.) The market for my fruit is different each year. I can tell you past years, but I can't tell you the future. I am handling prunes and apples. In the past years I have handled potatoes but not now. I haven't the records with me that show the number of carloads of products I handled in 1923. The records show that in 1923 I handled 373 cars. In 1924 I shipped 410; in 1925, 604; in '26, 470; last year 761. The prospects for the fruit crop for the year 1928 (904) in my com-

munity are excellent. I will ship during the current year approximately eight hundred cars. It will be in excess of what it was last year. Our apples go mostly to the Middle West. In the past I have shipped products to California, mostly in Los Angeles. Have never shipped to San Francisco. I do not know where the Rogerson-Wells cut-off is, on the Oregon Short Line. I never knew of it until to-day; that is, if I had, I had already forgotten it. It
488 has never been brought to my attention that the Rogerson-Wells (905) cut-off was designed at one time as relief for the shippers from my section of southwestern Idaho. I do not go into San Francisco with my apples, because if I would I would have no way to get out of there; I have no outlet when I get there. In case I ship any stuff there, if they reject it I am stuck, so I don't solicit any business there. I had occasion to-day to check up with distances from my community to San Francisco and Los Angeles, by the way of the proposed cross-State route and by the way of the existing route to Los Angeles via Ogden. The difference in distance to Los Angeles by way of San Francisco over the proposed route and by way of Ogden over the present route is fifty-four miles. I am interested in the construction of this cross-State route as a whole; not perhaps particularly myself, but as a community proposition. (906.) If this route is constructed, instead of shipping to Los Angeles direct I would ship my cars to San Francisco; therefore if I have no market there, go down to Stockton, Sacramento, and to Los Angeles, if I am permitted. I believe I could do that under a rate that is approximately my present rate to Los Angeles, the distance being approximately the same. The California market is growing considerably, if I understand correctly, and we are close to them, and naturally we could sell more apples in the territory. If this line is opened up in the manner I have described by way of San Francisco, and I am permitted a rate that will permit me to reach Los Angeles approximately the same as I now have through Ogden (907), I would stabilize a market in San Francisco. It would give me an open competitive market of all California for my products, if the tariff permits it, of course. If the tariff don't permit
489 it, it will do me personally no good, or my growers. If this condition is brought about and I am enabled to ship by way of San Francisco, that would stimulate the shipment of fruit, particularly of apples, from my community. Perhaps that would be reflected in the shipment of such commodities as potatoes from our territory. (908.) Very few cars of fruit were shipped into Los Angeles last year. I don't think it was over ten. If this change were brought about, whether the amount would increase or not is due to conditions of crops each year. I mean now, for example, like the year 1928, which the eastern markets has more than they can consume themselves, and we had to stay in our own boundaries, where last year we could go all over the United States and sell our stuff, because apples were scarce. That is what I mean. Last year

was not an average year throughout the United States. It was an exceptionally good year for Idaho as to the apple movement. We grow in Idaho Winesaps, Delicious, Roman Beauties, and Jonathan apples. (909.) The Jonathans especially are in demand in the California market. A year when there is an average production of apples in the United States I am forced to find a market closer home. That would stimulate the shipment of apples into California.

490 Cross-examination:

The largest number of cars of fruit I have shipped into California in any one year is 190 cars. That was in 1925, if I ain't mistaken. They were all apples. They went to Los Angeles and San Deigo. I think the difference in distance between Payette, Idaho and Los Angeles by way of our present rail route and by way of the rail route as it would be with the cross-State line constructed fifty-four miles. (910.) They tell me the difference between Payette and San Francisco by the present route and by the proposed cross-State line is four hundred miles shorter; that is, it is about four hundred miles shorter around by the new route. We do not sell anything in California besides apples except occasionally a car of prunes. (911.) That is fresh fruit. We ship to southern California by way of the Oregon Short Line and the Los Angeles & Salt Lake Railroad. Those are Union Pacific units through Salt Lake. To Los Angeles it would be a shorter route than shipping to San Francisco and then down on the Southern Pacific. And it is shorter to Los Angeles than it would be if the cross-State line is built. We have to compete with apples that go into San Francisco by boat. We go to San Francisco. Hood River apples and Yakima apples come down here and load on the boat (912); and Wenatchee go down there into the California markets. I try awful hard to break into the San Francisco market with apples. (913.)

491 As to whether I consider that I can get in there on a profitable basis in competition with other fruit, well, for example, last year we went clear to Buffalo, N. Y. That is right next door to New York.

Q. You have got lots of local apples to compete with in California, too, in the bay cities, haven't you?

A. Well, each year has a condition of its own, you know.

Q. Well, I mean, when there is a good yield there, a normal yield—Watsonville and Santa Cruz?

A. Well, they don't raise the varieties of apples that we do.

Q. Do they ship any apples in to compete with you?

A. They would if they had the right varieties, but they don't have.

Exam. ROGERS. I understood you to say that you didn't ship to San Francisco, because if they rejected your apples you were "stuck." Just what do you mean by that?

A. I didn't say I got "stuck," but I might be. I haven't solicited into that market since I have been in business.

Exam. ROGERS. Well, what would be the difference in the situation in that respect if the cross-State line was constructed or if it wasn't?

A. Well, if I go to San Francisco and the car was rejected no doubt I would get a privilege of going to Los Angeles from there, or Stockton or Sacramento, but the tariff wouldn't permit me. (914.)

Exam. ROGERS. Couldn't you do that now?

A. I don't think so.

Comr. MCMANAMY. You mean that there is no through rate to Los Angeles by San Francisco at the present time?

A. I don't think so.

Comr. MCMANAMY. And if the cross-State line is con-
492 structed there would be?

A. That is my contention. I don't know whether I am right or wrong.

Redirect examination:

If I bill my apples into San Francisco now, I have to pay an additional freight rate to get them on to Los Angeles, I believe. And if that line is built, making the distance about the same, I think I would be able to bill the apples to San Francisco and possibly sell them on the San Francisco market or divert them to Los Angeles without an increase in the freight (915) rate. I could not say whether my apples that are going into Los Angeles at the present time are in competition with apples shipped into that market by water.

Recross examination:

Q. (By Mr. SPENCER.) Well, you have got the same chance for that on the present railroad as you will have if they build a few more, haven't you? In other words, you have got a route into San Francisco now through the Rogerson-Wells line or through Ogden, and if you get into San Francisco you have got railroads down to Los Angeles and you have got boat lines down to Los Angeles. What you mean is that you haven't got as many rights there in the way of diversions and tariff privileges as you want? That is what you mean, don't you?

A. If I have those privileges, of course.

Q. You are fixed if you have those privileges. Isn't that right?

A. Well, I will take a chance on opening up new territory.

Further redirect examination:

Q. (By Mr. DUNCAN.) By shipping over that route how do you ship over the route you now ship? (916.) Do you have to
493 ice your cars?

A. No [sic].

Q. Now, in shipping to San Francisco over the proposed route, what result will that have in the cost of transportation?

A. If I am correctly informed, going through Salt Lake City, through that desert country, it is warm there all the time, if I under-

stand correctly—I have been through there several times in my life—and to go over this other route it is much nearer, we wouldn't have to ice them cars at all, and if we did have to ice them it would be just initial icing, which over Salt Lake the initial icing won't do. (917.)

494 PORTLAND, OREGON, *August 8, 1928.*

R. G. LARSON was thereupon produced as a witness on behalf of complainants, and having been first duly sworn testified as follows:

Direct examination:

I live in Ontario, Oregon, in Malheur County. (919.) I am county agricultural agent of that county. I have held that position approximately a year. I have resided in the State of Oregon for the past fourteen years. For a short time I was manager of a wheat ranch in the eastern Oregon section, and from there I taught three years at Corvallis; from there I went to Lake County. I taught rehabilitation work—ex-service men. After my teaching in Corvallis I went to Lake County, Oregon, as county agricultural agent. That was in 1923. I was in Lake County as county agent until I went over to Malheur County, except for a period of about two years. During that time I was manager of a mercantile company in Lakeview. (920.) My work as county agent in those two counties is mainly in an advisory capacity in connection with agricultural work in the counties. That is really our duty. We have to keep informed on all lines of agricultural work, livestock, crops; horticulture—whatever it may be. It involves the character of lands, the kinds of crops suitable for the lands in the country, estimates of yields, and methods of improving yields of crops. Marketing problems are also covered. They are all points to which I have given especial study as county agent of Lake County and Malheur County. I am here as a representative of the Malheur County Court. That court intervened in this proceeding in support of the complaint.

I have prepared a limited brief on behalf of the Malheur
495 County Court that I am ready to submit (921) in evidence here. When I say "brief" I mean a statement of the facts I want to submit. It is in written form. This statement is somewhat general in nature, but I have tried to cover the points which, I think, are important to our section of the country, and it has been prepared by myself under the direction of the Malheur County Court.

Malheur County, Oregon, lying in the Snake River Valley, is generally conceded to be one of the most productive agricultural sections of Oregon. This vast domain, larger than either Massachusetts or New Hampshire, with an area of 9,883 square miles and only 7.7 per cent of her acreage in farms, lies waiting development. The present valuation of her agricultural industry is $19,627,804, owned or operated by 1,331 farmers. The total acreage of these farms is 484,820, of which approximately 122,500 is under irrigation.

We have made the statement that the soils of Malheur County are among the most productive in the State of Oregon. (922.) We bear out this statement by the results of a crop yield survey made by the county agricultural agent in 1925.

66 yields of wheat were averaged, with an average yield of 41.9 bushels per acre; 35 yields of barley.

As to the low yield and the high yield, taken into account in getting that average, I will read the table as I have it. I will read it in this order: Crop, number of yields averaged, low and high yield, and the average yield.

Wheat, 66; low 14, high 76, and average 41.9.

Barley, 35; low 15, high 80, average 48.1.

Oats, 23; 16.6 low, 90 high, 56.7 average.

Corn, 40; 25 low, 90 high, 59.7 average.

Alfalfa hay, 61; 1.4 low, 8.4 high, and 5.1 average. That 5.1
496 was tons per acre. The others were bushels. The average yields before that are bushels per acre.

Clover hay, 7 yields; low 1 ton, high 4.1 tons, and average 2.4 tons per acre.

Clover seed, 12 yields; 3.3 bushels low, 8 bushels high, 5.4 bushels per acre average.

Potatoes, 13 yields; 110 bushels low, 476.6 high, 270.5 (923) bushels to the acre average.

Onions, 4 yields; 125 sacks per acre low, 425 sacks high, 268.7 sacks average yield.

Apples, 9 yields; 100 bushels low, 500 bushels high, 277 bushels average yield per acre.

Now these yields are not selected but are purely average yields. The high yields have been exceeded in many cases and will be exceeded again in 1928.

From my experience during the time I have lived in Oregon and the time I have been county agent in Lake County, and from what I know of production in other parts of the State, I would say that these average yields that I have given for various crops in Malheur County would compare very favorably with yields of the same products in other localities of the State of Oregon, and in practically every case they are higher than most any section of the State.

Approximately 50 per cent of the agricultural income in Malheur County is derived from livestock and livestock products. The county ranks first in Oregon in number of sheep, third in number of beef cattle, and fourth in eastern Oregon in the number of dairy cows. Dairying in Malheur County has more than doubled since 1920 and is contributing quite largely to the income of the farmers on the small irrigated ranches. This (924) expansion in dairying is going forward at a rapid rate.

497 Residents of this section have for the past twenty or twenty-five years been endeavoring to secure Government assistance in bringing water to vast areas that are adapted to production similar to the areas now under irrigation. Their efforts have finally met

with success and the Vale and Owyhee Federal irrigation projects have now been approved and construction has been started. These projects will add approximately 82,000 acres of irrigated land to the areas now irrigated in Malheur County and will provide supplemental water, and will displace present pumping units to the extent of 31,366 acres. All this work will necessitate the spending of about $21,000,000 of Federal funds in Malheur County and the immediate vicinity within the next few years.

I have just mentioned present pumping units. By pumping units I mean that practically all the lands irrigated in Malheur County to-day are irrigated from pumping plants out of Snake River, and this Owyhee project will displace these pumping plants. These private pumping plants require, generally speaking, a lift of water from thirty to sixty feet, in some cases slightly more than that. They run an average of about 40 to 60. That is a more expensive operation to provide water for the lands now irrigated than a gravity system under these (925) Federal projects that are under construction now. The last year the power bill alone for what we call the Shoe String ditch amounted to between $8.00 and $9.00 an acre, the power only.

Ten to twenty acres of these soils, irrigated, and devoted to intensified farming will provide a living for the average family. Forty acres is about all one family can care for without hiring help.
498 The average size of farm under these new projects is estimated at sixty acres. This means about 1,760 new farms on the 105,740 acres of new irrigated lands. Figuring that each settler on these new lands will spend $90.00 per acre in development during the first four years, and those figures are taken from Dr. Mead's report of 1925, there will be expended almost $10,000,000.00 in agricultural improvements. This amount of money as well as that spent by the Federal Government is all being expended with the hopes that the lands will be settled with happy and prosperous farm families. No doubt can be had as to the ability of the soil to produce abundant crops and success will be attained on these new projects if satisfactory markets can be reached.

Many of the people now residing on lands which these new projects will water homesteaded their lands many years ago and have held on under great difficulties in hopes that what is now taking place would come to pass. The Government has (926) shown its faith in southeastern Oregon by taking over the construction of these irrigation projects. In all, 30 to 35 millions of dollars will be spent in the development. The amount of money necessary to provide adequate railway facilities for reaching western markets is small in comparison. Western markets are rapidly expanding, and if these new projects are to be adequately served they must be given access to these markets by a short line from east to west across central Oregon.

The present acreage under irrigation in Malheur County:

From the water of the Malheur River, 35,732 acres;

From the waters of Cottonwood Creek, 173 acres;
From the waters of Willow Creek, 27,602;
From the waters of Owyhee River, 34,500 acres;
499 Big Bend Irrigation District, 5,000 acres;
Park unit Big Bend district, 2,800 acres;
Jordan Valley irrigation district, settled up, 1,500 acres;
Kingman Colony district, 1,200 acres;
Nyssa-Ontario district, 5,000 acres;
Payette Oregon Slope, 5,300 acres;
Small pumping plants (estimated), 4,000 acres;
Making a total irrigated area of 122,807 acres.

This data was taken from the State engineer's report of 1924–26. (927.)

When I say "Jordan Valley irrigation district, settled," I do not mean that that is settled and fifteen hundred acres under irrigation, or when settled there will be fifteen hundred. There isn't that much being irrigated now. I have forgotten the exact acreage, but there is still some acreage to be irrigated there.

This is the estimated present agricultural production in Malheur County, Oregon:

First, beef cattle: We have 39,040 head of beef cattle in the county, with a turn-over of 24.6 per cent annually. In other words, 24.6 per cent of that number should be sold each year, should go to market. This would mean 9,603 head, or 384 cars. When I said "should go to market annually" I perhaps should have said "do go to market each year"; perhaps that would be a little better statement.

These figures of what I call turn-over, these percentages, are based on (928) a study made by Professor Potter, head of the livestock department of the Oregon Agricultural College, and his field
500 man, Mr. Lindgren, and they are taken as an average for eastern Oregon conditions, and, I believe, are lower than the actual conditions in Malheur County, but I have used them as an average.

Beef cattle and sheep and hogs and horses should go to market when they are ready, because the longer you have to keep that stock and feed it the more expense is running up.

Now, another thing in getting them to market, when that stock is put on the cars the quicker they can get to market, of course, the less loss there is to ship. On the first run, which is ordinarily about four hundred miles—the runs are about four hundred miles—cattle will shrink in the neighborhood of four per cent, and about one per cent for each additional run, so that the shorter the distance to market the less shrink you are going to get in them, and on a 1,100-pound steer that would run into quite a bit of money if you stop and figure the shrinkage by, say, three or four runs in comparison with a smaller number. (929.) That is an important item, expedition of movement to market, in the shipping of cattle, sheep, hogs, horses, because every time those animals are loaded and unloaded there is more or less injury done to them. Careless handlers, with

prods, and things of that sort, damage—they damage hides and damage flesh. In my opinion, in the marketing of such farm animals, a saving in distance to a particular market of two or three or four hundred miles in the length of haul is an important consideration. It will save one or two feeds and one or two handlings.

The next item is sheep, 368,000 head of sheep in Malheur County, with a turn-over of fifty per cent annually, which would allow for marketing each year 184,000 head or 736 cars, and from those
501 368,000 head of sheep, with an average wool clip of nine pounds per head, that will provide sixty-six cars of wool each year for shipment.

As to feeding sheep in Malheur County, we are feeding at the present time a very large number of (930) sheep in the county. In the little stretch of country between what we call Dead Ox Flat, or across the river from Weiser, south as far as Nyssa, we winter approximately a hundred thousand head of sheep each winter. We have quite a number of farmers there that are very anxious to feed out lambs, and they are injured in this business because of the fact that our lambs in Malheur County are all lambed in February, they are too large to make feeding lambs at the time these men are ready to feed them, and they are anxious to secure, if possible, the smaller range lambs which they can fatten in that section of the country. Those smaller range lambs might come from central Oregon, through Northern Lake County, Deschutes, Crook and Grant Counties, those counties in there. If this proposed cross-State line were built and in operation a good many thousand head would come every year. I have no doubt about that at all. In fact, there have been a few come in under present conditions where they have had to ship them clear down through—I guess they went to Ogden and came back up to Ontario, from Northern Lake County.

Now going to hogs. (931.) We have 7,705 head of hogs, with a turn-over of 128 per cent annually, which would mean for market 9,162 head, or 98 cars. Explaining that percentage of 128 per cent turn-over, a hog ordinarily reproduces five or six times, on the average, sometimes they will go as high as nine or ten, so that you have a higher percentage of turn-over than you have with either cattle or sheep.

502 Dairy cattle: We have 4,745 head of dairy cows. Figuring their average production of fat as 175 pounds would be the equivalent of 996,450 pounds of butterfat, or 33 cars of butterfat, produced in the county to-day, that is, at the present time.

Horses: Twenty-eight carloads were shipped west last year. I have those figures from freight shipments.

Wheat: Now, on the remainder of these items, I have made a survey of the different freight shipping points, so far as I could get the information, and the balance that I have estimated from other sections. Now, it is hard to estimate exactly, because Malheur County loses a large part of her tonnage through Weiser, Payette, Fruitland, Parma, and Caldwell; she loses a large amount of ton-

nage through those points, and we get no credit for it in freight shipments. (932.)

In 1927, wheat shipments out of Vale, Ontario, Nyssa, and Brogan, amounted to 229 cars. I estimated out of other sections of Malheur County there were 50 cars shipped; total of 279.

The nearest large market for wheat to Malheur County is Portland. I think in every case those shipments of wheat that came west moved to Portland. The surplus production of wheat in Malheur County, what isn't used at home or feed, is increasing. And as these new lands come under cultivation there will be considerably more each year, because wheat lends itself to use as a quick cash crop to these people who are settling the new lands, and they will produce large acreages of it. Soil and climatic conditions are suitable for the increased production of wheat in Malheur County. We
503 have, as I stated a moment ago, a very high acre average in yield, and our average is being exceeded in practically every case by men who really are farmers, so (933) there is no reason why we should not increase our acreage considerably.

Barley: 1927 shipments out of Vale, Ontario, Nyssa, and Brogan were 27 cars, and estimated out of other sections of the county 5 cars, making a total of 32 cars. Those shipments have been coming westward. I don't know the destination. Portland, I presume. Conditions are favorable for the increased production of barley in Malheur County. I hardly think there will be markets in California for increased production of barley, because California is a large exporting State in barley. They are producing a large quantity of barley for European malt trade, so California would not provide us a barley market. Barley produced in Malheur County could come into the Willamette Valley for local consumption, and perhaps a considerable quantity of it could go to these Pacific coast ports for exportation. (934.) It could if we had the tonnage sufficient.

Potatoes: The 1927 shipments out of Vale, Ontario, Nyssa, and Brogan, 91 cars, and estimated out of other sections of the county 50 cars, or total of 141 cars. The soil and climatic conditions in Malheur County are such that we produce what is known as a mid-early potato. Practically all our potatoes are in that class, and potato shipments are taking place from that county at the present time. We have good high yields. Some of the shipments I have set down here have gone west. At the present time Los Angeles—or within the next week the buyers figure that Los Angeles will begin to take some of our potatoes, and I say Los Angeles,
504 because it is the only California market that we really can reach with potatoes from that section. In my judgment, in connection with the construction of the cross-State line, at certain seasons of the year Malheur County would ship (935) a lot of potatoes into California, because our crop comes on at a time when their early crop is cleaned up and the later crop is really not ready for market.

Onions: 1927 shipments out of Vale, Nyssa, Ontario, and Brogan were 47 cars. I didn't estimate any additional cars, because I wasn't familiar.

Prunes: 1927 shipments out of Vale, Ontario, Nyssa, and Brogan, 93 cars. The estimated out of other sections of the county, 45 cars, or a total of 138 cars of prunes, as green prunes. There were no dried prunes shipped out of that section. Those prunes are being diverted to wherever the market will take them. Most of them are going east. I don't believe that any of them have come west.

Apples: 1927 shipments out of Vale, Ontario, Nyssa, and Brogan were 215 cars, and estimated out of other sections of the county 350 cars, or a total of 565.

Malheur County isn't one of the large apple-producing sections, but we (936) produce from 500 to 750 cars each year, on a comparatively small—on an acreage of about two thousand. Under present conditions those apples practically all move east, although one shipper out of that section made the statement to me that if he were able to reach California markets readily he believed that fully fifty per cent of his shipments would go to California, and he ships 750 to a thousand cars of apples each year.

Poultry: 1927 shipments, estimated, 3 cars, and that was practically all dressed turkeys.

505 I don't know whether they came west or not. I do know, though, that the California market was about five to eight cents a pound higher than was the eastern market, so there would have been a very good opportunity for them if they could have shipped there. Conditions in Malheur County are suitable for sustaining an extensive poultry industry.

Seed, clover and alfalfa: In 1927, shipments out of Vale, Ontario, and Nyssa amounted to 16 cars, and estimated out of other sections 5 cars, or 21 (937) cars as a total, and this production is increasing very rapidly. Our acreage is growing by leaps and bounds. There is a possibility that a good deal of our alfalfa seed may come into western Oregon, due to the fact that we are producing and certifying a considerable acreage of Grimm alfalfa. It is about the nearest Grimm alfalfa producing section to Willamette Valley points, and Willamette Valley growers are fully convinced that they must use Grimm alfalfa, so that that feed should come west. Our weevil we have had with us, it is sort of like an attack of smallpox, I guess, the weevil doesn't seem to bother us any more. This last spring Mr. H. H. Witherspoon, horticultural commissioner in that section of the State, spent a day with me in the alfalfa fields of Malheur County, trying to locate a weevil if he could. He was unable to locate a weevil, but he did find a considerable number of the parasitic fly, and he made the statement to me that as far as he was concerned he was going to recommend to the board of horticultural commissioners that the quarantine be lifted. Of course, that would depend on the

action of the rest of the board. His recommendation was, though, to remove the quarantine. (938.)

506 That parasitic fly was introduced in Malheur County in 1921 or '22 first, and now it can be located in almost any of the alfalfa sections where you can't locate a weevil. I can't say that I have been unable to find one. I have found a very, very few in isolated sections of the county, where perhaps the fly hadn't had a chance to penetrate. There were a few in one section. You can prove very readily that this parasitic fly has controlled the weevil infestation and practically eliminated it in Malheur County if you will go into the alfalfa sections. Where it is possible to find a weevil at all you will find upon examination of the larva of that weevil that each of them contain underneath their body, in the belly portion of the what you might call the body, the tiny worm, possibly a thirty-second of an inch in length. Now, that worm is the larva of the egg from this parasitic fly, or the ichneumon fly, and every larva of the weevil contains the worm of this fly in it. That means the weevil larva will never mature. When the larva goes into its cocoon preparatory to its coming out of the weevil, instead of an alfalfa weevil coming (939) out the ichneumon fly will come out. If Mr. Witherspoon's recommendation has any influence with the board—and he is one of the oldest members of the board—the quarantine against Malheur produced alfalfa hay should be lifted within the very next few short term of years.

Peaches and pears: Out of Brogan, Nyssa, and Ontario last year, four cars of peaches and pears were shipped.

Honey: There were two cars of honey shipped out of Vale in 1927, making a total out of the county, actually shipped, of 2,577 cars of agricultural produce.

Now, to continue with my general statement:

507 The above estimate of 1927 shipments represents an average year, and is based on actual shipments and estimates, using as a basis the figures of the Department of Agricultural Economics of the United States Department of Agriculture in their report on agricultural production in 1927.

It is estimated that approximately fifty per cent, or (940) about 1,250 cars, of these products are now moving over circuitous routes to western markets. When I say "circuitous routes" I mean they go south, I presume, to Ogden and across to Los Angeles. I don't know that anything has ever been taken over that road—I believe it is called the Rogerson-Wells cut-off—I don't know of anything that ever was taken across there from that section. If it goes to Portland or to cities north of Portland in the northwest, it goes 175 miles north before it ever starts traveling westward. I mean on the Union Pacific main line through Baker and Pendleton and then down the Columbia River. That is what I would call a circuitous route. I mean that there is at the present time no direct outlet, rail outlet, for the products of Malheur County, either to the north Pacific coast or the south Pacific coast.

It is an undisputed fact that these markets are developing rapidly and that if they were more easily accessible a larger portion would go to them. (941.)

California alone has increased her consumption of imported beef by 32 per cent in the five years, 1922 to 1926, inclusive, and her consumption of imported sheep by 26 per cent in the three years, 1924 to 1926, inclusive. The expansion that has taken place in the consumption of meat commodities is practically paralled by the consumption of other agricultural commodities.

508 Now, the next item I have taken up is the development of Malheur County agriculture to be expected with the completion of the Owyhee and Vale projects.

The Owyhee project:

The Owyhee project now under construction by the Federal Reclamation Service will irrigate approximately 80,960 acres of new lands. Approximately 56,400 acres of these new lands lie in Malheur County, Oregon. The balance of 24,500 acres lies in Idaho adjacent to Malheur County.

Additional water will also be supplied to 31,366 acres of land in Malheur County now being partially watered, and will increase the productiveness of it.

Work has already started on this project and it will no doubt be completed within a period of five or six years.

The quality of this new land is equal to, or better than, the lands now under irrigation and it is all adapted to an intensified type of farming which will produce large tonnages of exportable commodities. (942.)

In Malheur County the policy of one-crop farming is not generally followed. That practice is rapidly being abandoned, and our farmers are going into a diversified type of farming in which they employ rotation of the various crops. Alfalfa hay might be called our basis crop. Red clover is becoming a very important crop. In fact, our alfalfa hay is being decreased with the increase of red clover. We also grow corn, we grow potatoes, we grow letture, we grow onions, wheat, barley, oats—in fact, we will grow any crop that can be raised in, you might say, under any conditions excepting tropical ones. We have a very wide range of crop selection.

509 It has been my experience that these irrigated lands in Malheur County have not been devoted year after year to the production of the same crop. They are diversifying their farming. In my judgment that is a better and more profitable policy for a farmer to follow than the cropping of his lands year after year to the same crop. That was demonstrated about 1920. At that time (943) our county over there was producing practically nothing but alfalfa hay. They had been getting $15.00 to $20.00 a ton for their hay, and their price dropped to where they couldn't even get an offer of two and a half or three, and the county was broke for four or five years as result of it, and since they have taken up the diversified

type of farming the conditions have improved, and are continuing to improve.

The Vale project is another Federal Reclamation Service project. Work on this project has advanced to the stage that there is little doubt but that it will be completed by 1930, and this project will add twenty-four thousand seven hundred eighty acres of new irrigated lands to our acreage now under irrigation in Malheur County.

Then I have made an estimation of the probable tonnage with the development of the Vale and the Owyhee projects.

When these two projects are completed there will have been added to the present irrigated area of Malheur County alone approximately 82,000 acres.

This acreage of new land and the supplemental water provided for lands now inadequately watered should more than (944) double the agricultural production of the County.

It is difficult to estimate what utilization will be made of
510 these new lands, but economic surveys have shown that a reasonable utilization would be on about the following basis on the average farm on these projects.

Taking up the crop percentage devoted to the crop, and the acreage figured on the total acreage.

Alfalfa, 32.5 per cent of acreage in total crop, or 26,650.

Red clover, 10 per cent, or a total acreage of 8,200.

Pasture, 10 per cent, or a total acreage of 8,200.

Wheat, 20 per cent, or a total acreage of 16,400. (945.)

Corn, 7.5 per cent, or a total acrage of 6,150; barley, 12.5 per cent, or a total acreage of 10,250; potatoes, 5 per cent, or a total acreage of 4,100; buildings, fences, roadways, and other improvements, 2.5 per cent, or an acreage of 2,050; making a total of 100 per cent, or the 82,000 acres.

They have been producing some corn in Malheur County almost since the first irrigation work was done in there. They have been producing corn for years, but not on an extensive scale. The acreage planted to corn is increasing and we believe that it can be increased very heavily and still be an economically sound crop for them to grow. In my judgment, the growing and increased production of corn in Malheur County is feasible. We have a growing season of 150 to 180 days, which is sufficiently long to mature corn and mature it properly. At the present time we have—I would not try to estimate how many acres of corn in the county, but the growers of all of this (946) corn are realizing yields of 75 and 100 and 125 bushels per acre in many cases.

I was born in Iowa and lived there the first nineteen years of my life. As to how the yield of corn in Malheur County
511 compares with tat in Iowa an dother various States at the present time, I have forgotten the figures, but it seems to me between 35 and 40 bushels is the average production per acre for the State of Iowa. I would not state that figure definitely, however. As to the possibilities for markets of corn produced in Malheur

County, Portland, last year, according to the grain inspection service, received 963 cars of corn from Argentina, the States of Minnesota, Omaha, Nebraska, and various other Corn Belt States. Malheur County is producing now corn of a variety and quality suitable to satisfy the requirements of the Portland and Pacific coast markets. Last year a sample of corn selected by myself and the secretary of the chamber of commerce at Ontario, Mr. Doolittle, a sample of this corn was sent to one of the Portland mills for a statement from them as to what they considered the quality to be. That was a cereal mill at Portland. (947.) I believe it was Albers Brothers; I am not sure. They stated in a letter back to us that that corn compared very favorably in all respects with the corn from Nebraska, Minnesota, and Iowa. There is a substantial demand for corn in western Oregon outside of Portland. They use corn in practically all the different poultry feeding rations, and our poultry industry on the Pacific coast is growing rapidly. They are using large amounts of corn for that one thing. A large amount is being used for human consumption, and our populations we believe are increasing all the time. Western Washington and California should consume considerably more corn, or as much at least as western Oregon does, because their poultry industry alone is as large or larger than the Oregon poultry industry. And also our corn is used in dairy rations. There is a large number of uses to which
512 it can be put. In my judgment there is the opportunity for a largely increased production of corn in Malheur County, with the idea of marketing it in the three Pacific Coast States. To bear out my statements, I might relate an experience with Professor Hyslop, who is head of (948) the farm crops department at the Oregon Agricultural College. He spent last week in Malheur County with me, and while there we looked over corn fields. He had not been in the county for almost five years. He was so impressed with our corn crop and our corn prospects that he insisted that next year his department and I cooperate in putting on a piece of corn work over there and trying out the different varieties, trying to find which is the best variety for our farmers there, and with the intention of stimulating and trying to increase the corn production for the purpose of exportation to the Pacific Coast States, western Oregon and other coast States.

Figuring the utilization of the lands of the Owyhee and Vale projects on this basis there would be produced on these lands a tonnage as follows:

Hay: 26,650 acres of alfalfa producing 5 tons per acre, 133,250 tons; 8,200 acres of clover producing 2.4 tons per acre, 19,680 tons.

Wheat: 16,400 acres producing 41.9 bushels per acre, 20,615 tons.

Corn: 6,150 acres producing 59.7 bushels per acre, 10,280 tons.

Barley: 10,250 acres producing 48.1 bushels per acre, 9,832 tons. (949.)

Potatoes: 2,050 acres producing 270.5 bushels per acre, 16,635 tons.

Clover seed: 8,200 acres producing 5.4 bushels per acre, 1,328 tons.

513 Or a total of 211,620 tons of agricultural commodities that will be produced annually. This tonnage would be either shipped direct to market, or used to produce more concentrated products for shipment. The latter course is more economically sound and no doubt will be the practice followed. If livestock is utilized to concentrate the feeds produced, the production of these new lands will be sent to market in the form of hogs, butterfat, and beef. All of these commodities will be absorbed by western markets and will provide tonnage for a railroad across central Oregon.

On these new lands there will doubtless be a surplus of alfalfa hay produced for several years. This surplus hay will readily be absorbed by western Oregon counties which are badly in need of legume hays for the maintenance of their dairies.

The Owyhee and Vale projects together with lands at present under irrigation do not represent all the agricultural development that may be expected from Malheur County. Much of the present irrigated area is now in large hay ranches that will eventually be broken up into smaller farms with consequently larger production. This movement has already started. (950.)

An example of this is in the Harper section where one of these large hay ranches is now being farmed by 31 families, producing practically as much hay as the ranch originally produced, and in addition it is estimated they will ship fifty cars of wheat this season.

The Brogan section is at the present time arranging for more water which will increase their production greatly. The Westfall section has 4,000 acres yet to be irrigated. The Jordan Valley

514 project has another 9,500 acres to be irrigated. The Warm Springs project has 4,000 acres to be brought under irrigation.

The irrigated lands of Malheur County may be expected to develop into a section comparable to the Yakima Valley in Washington and the Twin Falls section in Idaho. Both of these projects are outstanding examples of western irrigation, but have no more, if as many, natural advantages. The bench lands on these new projects are ideal fruit lands and a considerable acreage may go into fruit, with a resultant heavy tonnage for export.

This section is also one of the few regions adapted to corn production. Yields of 100 bushels of corn per acre are quite common and there is no reason to believe that Malheur County may not produce the corn requirements of the Pacific coast in so far as acreage available will permit. Oregon alone of the Pacific Coast States imported 963 carloads of corn in (951) the 1926–27 season. This would amount to the production of 11,534 acres at the average yield of 59.7 bushels per acre in Malheur County.

It is only reasonable to expect that these lands will within a comparatively few years be producing the tonnages as estimated in this review. Land settlement policies are improving, and there is a de-

sire for these lands as is manifest from the volume of inquiries received from all parts of the United States by the local chambers of commerce, and the county agricultural agent's office. Many people are already coming in prepared to buy lands even though they know it will be a few years before some of this land will receive water. Many of these people are buying lands and are set-
515 tling here waiting for the new lands to become available.

As to the effect so far as Malheur County is concerned of the construction and operation of this cross-State line, as I stated in my summing up of the situation in my paper, we should develop into a section which is comparable to Twin Falls or Yakima. We have more natural advantages than they have. We have a longer growing season. We have better soil conditions, and we will have, when the Owyhee and Vale projects are completed, as good or better water supply. (952.)

Those sections no doubt at the time the irrigation project was started in there looked like vast desert wastes, and a good deal of our country looks the same way to-day, but I believe with a little vision on the part of a person viewing that country they can't help but seeing sections of the country such as our other prosperous and permanently settled irrigation projects. The Yakima sections and the Twin Falls sections now are and have been served for considerable time in the past with adequate rail transportation. I can't say as to when that transportation was provided them, but they seem to be pretty well covered by railroads. Twin Falls is not included in that statement quite so well as some of the other projects. I believe the statement could be truthfully made that both the Twin Falls and Yakima sections have better rail outlets to consuming markets than Malheur County has at the present time.

I do not believe that Malheur County and that section of the State of Oregon ever can realize a proper measure of development of its resources from the construction and (953) completion of irri-
516 gation projects alone without the providing of additional transportation facilities for the expeditious reaching of markets for the products of Malheur County. And our western markets are going to be and are becoming right now one of our important outlets for the class of commodity which we are prepared to raise on these new projects. The views I have expressed here represent the sentiments of the county court of Malheur County and of the people of Malheur County generally.

I was not here when Mr. Teutsch testified. My estimates of utilization from the Owyhee and Vale projects are about four times in tonnage that of Mr. Teutsch's. I have seen his testimony in brief form. He has figured his tonnage reduced to livestock products, which I state might be done. I haven't gone into it to that extent. And that would explain the difference there. He has reduced it in terms of beef, hogs, sheep. I have simply carried it out as crop tonnages. (954.)

On hay I have 133,000 tons of alfalfa and Mr. Teutsch only uses some 11,000 tons. He has taken his figures, I presume, on a little different basis than I have. I, in my figures, did not attempt to segregate the items into their various uses; I simply prepared them in a general way, or in totals. Now he has estimated in there that on these farms there will be a certain amount of this hay that will be utilized for the production of butterfat and the production of beef, leaving only a portion of the total prduction available as hay tonnage, and he has worked it out on a different basis than I have worked it out. That is the reason our figures are different. If our figures were reduced to the same final terms I believe our figures would coincide pretty closely.

517 Cross-examination:

I am giving the entire production as near as I can estimate it for the present time; and I have used 1927 as a year to base my estimates upon because I believe it was an average year. (955.)

Exam. ROGERS. By the entire production you mean entire production in Malheur County?

A. No; I don't mean production either; I mean shipments. These figures I give are actual carload shipments that went out of there. Of course production figures are different, because a lot of that produce was used at home in feeding livestock and things of that sort.

Q. (By Mr. SPENCER.) Well, you estimate that the volume of the shipments that move out of there from increase in production; you don't mean you have gone to the railroad stations and got the number of cars that move out?

A. For 1927 I did; yes.

Q. Well, but your general statement there of beef production, and alfalfa production, and grain production——

A. No, I didn't.

Q. And dairy production, and dairy products production, are all estimated from your knowledge of the situation there, are they not?

A. That is the case with hogs, sheep, and beef cattle. The other is an estimation of shipments out of sections not covered by the freight offices in Malheur County. Now Malheur County, as I said a while ago, is drawn upon by Weiser, Payette, Fruitland, Palmer, Caldwell, all draw upon Malheur County, so that it is hard to get definite figures as to the amount of stuff that goes out. (956.)

Q. And you have made those estimates?

518 A. I have made those estimates.

And that is the entire production in shipments in all directions whether it is to California, to north Pacific coast, or east, or south, or elsewhere. Twenty-seven hundred and some cars, yes, were shipped out last year.

As to whether I have undertaken to analyze where those cars go, whether down to Los Angeles, or here, to Seattle, or Spokane, or to Denver, or Missouri River, or east, I state in my testimony here that

I estimate that 50 per cent of this is moving westward and I have reached those figures by talking with shippers of livestock, fruits, grains, and things of that sort.

As to whether I am not satisfied that the railroad there that serves this country at Vale and Ontario and these other shipping points that I mention, whether it does not give me adequate service, I didn't say it didn't give us adequate service. It gives us service in so far as cars are concerned. (957.) Its employees are courteous, and we get all the service possible, considering the present locations of these railroads.

Q. Yes; it is located wrong, though, to get to the coast?

A. It is located wrong for our conditions there.

Q. Sure. And it should have a shorter route from Portland to Seattle; is that right?

A. Well, that is not particularly essential. This other road, this proposed road would shorten our route. We are not complaining particularly about our Portland route. It is a little out of the way but we can get along with that very nicely, as far as the north coast is concerned.

Payette is 3½ miles north and east of Ontario on the same railroad, the Oregon Short Line, on the main line. (958.)

Fruitland is about a mile across the river from Ontario on the Payette Valley branch. Palmer is on the Oregon Short
519 Line east and a little south of Ontario. Weiser is east and north of Ontario about 17 miles on the main line. Nampa is south and east of Ontario on the main line. So is Caldwell.

Comparing the distance from Ontario to Portland via the present route of the Oregon Short Line and the Oregon-Washington Railroad & Navigation Company with the distance by way of the cross-State line, Crescent Lake, and the Southern Pacific into Portland, as I remember those figures there is a difference of between 25 and 50 miles in all in favor of the proposed line. (959.)

Q. Now have you been as careful in estimating those distances as you were in the preparation of your estimates of production here?

A. I have not, because I figured that that was more the work of men who were familiar with that type of railroad business. I was trying to figure agricultural production as an agricultural man.

Q. Yes; but you have been here for an hour and a half telling us the advantages of the cross-State line and you have based that advantage on distance alone, haven't you?

A. No; I don't think that I have.

Q. Well; you would not use it if it was a more circuitous and longer route and an inferior route as compared with the present route, would you?

A. I figure that our need for this cross-State line is brought about by the fact that we cannot reach northern California and central California points without making an extremely long and hard trip out of it. Livestock could not be shipped that far successfully.

Q. But you said definitely and positively, in answer to leading and suggesting questions by counsel, that this route from Ontario to Portland was not a direct route and that it was circuitous and out of the way, and that the cross-State line was a
520 shorter route. Now is that the way you want to be understood now? (960.)

Mr. McCULLOCH. I object to that question because it is based on nothing that I said of the kind, and I don't think the witness ought to be asked to answer a question based on an incorrect assumption.

Mr. SPENCER. You said, "You haven't got a direct route now to the northwest." That is just what you said.

Q. Now what is the mileage from Ontario to Portland on the Oregon Short Line and the O.-W. R. & N.?

A. It is about 420 or 430 miles.

Q. 432 miles, to be exact, isn't it?

A. Very nearly that. I don't know positively.

Q. Yes. And all of these towns that we have mentioned here are east of the junction at Ontario and have got to go to that junction, whether they go via the cross-State line or via the present route; isn't that true?

A. Well, there would be a few miles, although, if we had these loading points in Malheur County, or if we had this cross-State line, most of this product could be hauled to Ontario just as easily as it could be hauled to Weiser, Payette, and these other points. The distance is about the same in most cases.

Q. Sure. You mean it could be hauled from the field of production to Ontario? (961.)

A. To Ontario.

Q. But the point I am asking is that Ontario is the place to compute the distance for all of these shipments, whether it is from any of these other towns or whether it is from Ontario?

A. Well, we were computing them from Malheur County. The Snake River Valley there—the total distance is not over 25 or 30 miles from north to south, so the total distance of the variation is not much one way or the other, and Ontario is about
521 the center.

It is 126 or 127 miles from Ontario to Crane. From Crane to Crescent Lake via the proposed route is 173 miles, if I remember those figures. That is the old Odell Junction. Figure 16 miles on top of that, making the distance 189 miles. I can not state definitely the exact mileage from Crescent to Eugene but the distance must be close to 96 miles. (962.) From Eugene to Portland it is about 120 miles; possibly 124.

Q. Now that would make a total of 536 miles from Ontario to Portland via the cross-State line and 432 miles via the present route, or a difference in distance alone of 104 miles.

A. We don't have any diverting chance, though, until we get to Portland.

Q. But you said that the present route was not a direct route to the Pacific northwest markets?

A. It is not so direct to the Willamette Valley points, such as Eugene and over into Marshfield and places of that sort, which will use a lot of our product. When I speak of western Oregon, or the northwest, or the Pacific coast, I mean all of western Oregon, not just Portland.

Exam. ROGERS. Let me ask you this, Mr. Larson: Are you urging the cross-State line in order to reach Portland and north of Portland?

A. Not particularly north of Portland. (963.) I think that if we had the cross-State line to get into western Oregon that it would give us the opportunity to divert north or south. We could go to Portland if we liked; we could go to San Francisco, if we liked. It would give us an opportunity to get either way. As it is now we don't have that opportunity at all.

Q. Well, you would expect to pay higher rates for this additional mileage, wouldn't you?

A. That would depend entirely upon what rates were made.

522 We are not going into that.

Q. You haven't gone into that either?

A. I don't think that this case is going into that at all. I don't think this hearing is going into that question. The rates have not been brought up.

Q. Now would you move any wheat or potatoes, or other stable products that stand up under shipment, by way of the cross-State line to San Francisco if the combination with the water from Portland made a lower rate?

A. We are shipping some potatoes to California now.

Q. How are you shipping them?

A. They are going down through Ogden, I presume, over to Los Angeles.

Q. Do you know?

A. I know they are going to Los Angeles; I don't know exactly which route they are taking, but I have never heard of them using that Rogerson-Wells cut-off. They may. (964.)

Los Angeles really is the California market that we use and do business with under the present conditions. And Twin Falls are also using Los Angeles to a certain extent. I know that the railroad from Rogerson to Wells is there, and there is a service I understand of about two or three trains a week, of a combination train.

Speaking of shipping alfalfa hay over into western Oregon that would be used for dairy cattle largely, whether as a matter of fact the dairy cattle are being shipped from Lane County over to my county now, I do not know that that is taking place at all. (965.) There may be a little of that but I doubt it. I don't think they would be shipping dairy herds from western Oregon to us and we shipping the alfalfa to western Oregon so that those two articles would pass enroute; I don't think that would take place.

523 Q. No; I notice here on page 15 of Mr. Teutsch's exhibit he has got 40 cars of alfalfa hay moving to Lane County, and he has got 66 cars or 700 head of dairy stock. Now are they going in the same direction or in opposite directions?

A. Well, that 66 cars of dairy stock, what is becoming of it? Where is it going?

Q. I am asking you that.

A. Well, you said that he has that. You don't state where it is being shipped or whether it is in or out.

Q. He said Lane County estimate of present agricultural tonnage. He has given the tonnage from the eastern counties.

A. Yes, sir.

Q. Now are you going to ship dairy cows into western Oregon?

A. Not for a good many years to come; no.

Q. Is western Oregon going to ship dairy cows into your country? (966.)

A. In a limited number. In a limited number. They will possibly ship a few in there.

Q. As a matter of fact, the dairy herds of western Oregon have shrunk in the last few years, haven't they?

A. They might have shrunk slightly during the last two or three years, due to disease and some other causes.

Q. No; from the sale to California buyers?

A. Well, some of that has been diseased stock that has gone to California buyers.

Q. Isn't it true, to your knowledge, that there has been a real invasion and purchase at high prices in western Oregon, of dairy stock, by California dairy people and by southern Idaho dairy people?

A. There is a lot of dairy stuff being bought by California all right.

Q. Now you asked me whether the 66 cars were going east or west. Mr. Newell classifies them as going east, eastbound, on
524 page 124 of his Exhibit 16, but you don't think they will be going over there, do you?

A. That is dairy cows you are speaking of now?

Q. Yes; 700 head the first year of operation.

A. That is, out of Willamette Valley points and going eastward?

Q. Yes.

A. Well, we are developing over in our country; all of that eastern Oregon country is developing, as far as the dairy industry is concerned. (967.) Now, from 1920 to the present time we have more than doubled, and we can still use more cows over there, and possibly there will be some cows sent to us. But western Oregon has got, I believe, a surplus of dairy stuff. They won't shrink in numbers but very little.

Q. They are short now, aren't they?

A. Well, they are possibly not quite up to their standard, but they are short principally because of the fact that they can not get, at the present time, satisfactory feeds at a price which will enable them to compete with sections that are growing their own feeds right on the ground. If they can buy alfalfa hay cheap enough the chances are that they won't shrink any more.

Q. You were speaking of the Yakima country and its prosperity; it has perhaps been the most marked of any irrigation district in the west, has it not?

A. Well, their development has been——

Q. That is what I mean.

A. I don't know as to the actual prosperity of the individuals on the project.

Q. Now they stayed with fruit primarily at first, didn't they?

A. Yes; they produced lots of fruit.

Q. And then developed and expanded into dairy production and other diversified production?

525 A. They are shipping quite a number of different commodities at the present time in rather large amounts. (968.)

Q. Yes. They are 165 or 170 miles from the Seattle market, aren't they?

A. I don't know the distance in there.

Q. And they are about 315 or 320 miles from the Portland market?

A. I would presume that would be about right; approximately so, anyhow.

Whether it is a fact that train operations into Ontario from Portland are accomplished in substantially the same or less time from Portland than they are to Yakima, although the distance is greater, that is true in regard to passenger service. Passenger service is about 14 hours from Ontario to Portland.

Our fruit stuff goes east and most of our cattle comes west and goes to Los Angeles. (969.)

Q. But you have and enjoy an extensive district that has made remarkable growth the last seven or eight years, hasn't it, since you have gotten into this dairy production and diversified farming? Is that right?

A. The country has developed during the last few years, not extremely rapidly, but it has developed.

Q. And it is just served by the main line and branch lines of railroads and has been for several years; isn't that true?

A. It is served by the line running from Ontario to Crane, and one or two other small branches, and the main line; yes. Our lines are all restricted right to a small location, you might say, right in the center of the Snake River Valley. It runs along the eastern portion of the county.

Q. You have the line from Erb along the south bank of the Snake River, adjoining the main line at Nyssa, which is near

526 the junction of the Burns branch, called the Oregon eastern branch, don't you?

523 Q. No; I notice here on page 15 of Mr. Teutsch's exhibit he has got 40 cars of alfalfa hay moving to Lane County, and he has got 66 cars or 700 head of dairy stock. Now are they going in the same direction or in opposite directions?

A. Well, that 66 cars of dairy stock, what is becoming of it? Where is it going?

Q. I am asking you that.

A. Well, you said that he has that. You don't state where it is being shipped or whether it is in or out.

Q. He said Lane County estimate of present agricultural tonnage. He has given the tonnage from the eastern counties.

A. Yes, sir.

Q. Now are you going to ship dairy cows into western Oregon?

A. Not for a good many years to come; no.

Q. Is western Oregon going to ship dairy cows into your country? (966.)

A. In a limited number. In a limited number. They will possibly ship a few in there.

Q. As a matter of fact, the dairy herds of western Oregon have shrunk in the last few years, haven't they?

A. They might have shrunk slightly during the last two or three years, due to disease and some other causes.

Q. No; from the sale to California buyers?

A. Well, some of that has been diseased stock that has gone to California buyers.

Q. Isn't it true, to your knowledge, that there has been a real invasion and purchase at high prices in western Oregon, of dairy stock, by California dairy people and by southern Idaho dairy people?

A. There is a lot of dairy stuff being bought by California all right.

Q. Now you asked me whether the 66 cars were going east or west. Mr. Newell classifies them as going east, eastbound, on
524 page 124 of his Exhibit 16, but you don't think they will be going over there, do you?

A. That is dairy cows you are speaking of now?

Q. Yes; 700 head the first year of operation.

A. That is, out of Willamette Valley points and going eastward?

Q. Yes.

A. Well, we are developing over in our country; all of that eastern Oregon country is developing, as far as the dairy industry is concerned. (967.) Now, from 1920 to the present time we have more than doubled, and we can still use more cows over there, and possibly there will be some cows sent to us. But western Oregon has got, I believe, a surplus of dairy stuff. They won't shrink in numbers but very little.

Q. They are short now, aren't they?

A. Well, they are possibly not quite up to their standard, but they are short principally because of the fact that they can not get, at the present time, satisfactory feeds at a price which will enable them to compete with sections that are growing their own feeds right on the ground. If they can buy alfalfa hay cheap enough the chances are that they won't shrink any more.

Q. You were speaking of the Yakima country and its prosperity; it has perhaps been the most marked of any irrigation district in the west, has it not?

A. Well, their development has been——

Q. That is what I mean.

A. I don't know as to the actual prosperity of the individuals on the project.

Q. Now they stayed with fruit primarily at first, didn't they?

A. Yes; they produced lots of fruit.

Q. And then developed and expanded into dairy production and other diversified production?

525 A. They are shipping quite a number of different commodities at the present time in rather large amounts. (968.)

Q. Yes. They are 165 or 170 miles from the Seattle market, aren't they?

A. I don't know the distance in there.

Q. And they are about 315 or 320 miles from the Portland market?

A. I would presume that would be about right; approximately so, anyhow.

Whether it is a fact that train operations into Ontario from Portland are accomplished in substantially the same or less time from Portland than they are to Yakima, although the distance is greater, that is true in regard to passenger service. Passenger service is about 14 hours from Ontario to Portland.

Our fruit stuff goes east and most of our cattle comes west and goes to Los Angeles. (969.)

Q. But you have and enjoy an extensive district that has made remarkable growth the last seven or eight years, hasn't it, since you have gotten into this dairy production and diversified farming? Is that right?

A. The country has developed during the last few years, not extremely rapidly, but it has developed.

Q. And it is just served by the main line and branch lines of railroads and has been for several years; isn't that true?

A. It is served by the line running from Ontario to Crane, and one or two other small branches, and the main line; yes. Our lines are all restricted right to a small location, you might say, right in the center of the Snake River Valley. It runs along the eastern portion of the county.

Q. You have the line from Erb along the south bank of the Snake River, adjoining the main line at Nyssa, which is near

526 the junction of the Burns branch, called the Oregon eastern branch, don't you?

A. Well, that is what they call the Homedale branch?

Q. Yes.

A. Well, that runs along the extreme eastern boundary of the county for ten or fifteen miles; that is, in the county. It goes on, of course, south into Idaho points, but in Malheur County it has about ten or fifteen miles of trackage. (970.)

Q. Well, it is a branch that comes into Malheur County?

A. Yes.

And it goes out into the country about 35 or 40 miles. The McCall branch going down to Nampa in that same territory does not affect us. That is entirely over in Idaho and I don't know what there trackage is or their conditions. (971.)

We don't object to doing business with Idaho, and Idaho does business with us, and there is a railroad across there from Payette to Emmett. I have not heard of the Rogerson-Wells line being used. Perhaps it is being used to some extent.

The crop yields that I gave here are contained in our reports and they have been published in newspaper literature. They have been used in a number of different studies. As county agent I report them to Corvalis. They cover the year 1925.

The Willow Creek project that I mentioned is up on the Brogan branch in towards Brogan. (972.) As to whether I advise anyone to go up there and settle on that, it is a very good country for its uses. They are short on water now but they are at the present time making arrangements to secure an additional supply, which will make a good country out of it.

Those figures, 27,000 acres, I took from the State engineer.

I don't think it is entirely correct to say there were less
527 than 4,000 acres that could be watered in there. I think there is possibly around 4,000 acres that are, you might say, developed. The remainder of this land is producing alfalfa hay, wild hay, and crops of that sort. Practically that entire valley is being farmed from Brogan to Vale, but very little of it is producing fruit. (973.) I go through there every few days. The large orchard up there on the Westfall above the Jamieson was abandoned due to the fact that due to litigation their water was taken from them and used on other lands. We have fully as much orchard as that and good producing orchards in the Brogan country, seven miles above it. They are producing good crops of fruit with a limited water supply.

Q. Now as I understand your testimony, you are representing here, taking it from the State engineer, that 27,000 acres can be watered and irrigated from the waters of Willow Creek?

A. It has been estimated that they can do that, yes.

Q. How many years ago was that estimate made?

A. A few years back. The estimate I have here, the report I have here, is 1924 and '26. (974.)

Q. Well, you know it is a fraud, don't you?

A. Well, I would not say it is a fraud.

Q. What is the Warm Springs? Do you advise anybody to go on to Warm Springs and settle?

A. They have some very good land on that project, and there are very prosperous ranchers on it to-day. (975.)

The waters of Willow Creek are partially impounded by a dam up there but not entirely. There is a lot of land on Willow Creek being irrigated and raising alfalfa hay and other types of hay that are above the dam site; still it is Willow Creek water. This
528 Willow Creek runs from in above Ironside, makes a big turn down around through, comes in behind Brogan, waters land there, and from Brogan almost down to Vale. A lot of this land is not below the dam at all. (976.) It is not irrigated in the sense that term is ordinarily used, as an irrigation project; it is being used as flood waters and used in the production of hay—wild hay like we use in the Harney Valley—most of it is alfalfa hay. There is some wild grass hay among it. That particular territory is not settled and irrigated in the sense that Dr. Mead explains settlement for the Ochoco and Warm Springs or Vale projects. It is settled by stock men who are among some of the most prosperous citizens we have in Malheur County. They have large ranches and they are getting plenty of water for their hay lands, producing their feed, and it is counted as irrigated land in any sort of a study. They feed the hay they produce right in that section.

Q. Now when that project was developed it was developed as a 50,000-acre project, wasn't it?

A. I wasn't there; I don't remember. I don't know about that.

Q. And it is represented as a 27,000-acre project in the report of the State engineer, and you and Mr. Teutsch so represent it, don't you? (977.)

A. I take my figures from the State engineer's report.

Q. Yes. And when you speak of an irrigation project you speak of—you don't speak of a wild hay project, do you?

A. No; not when I speak of an irrigation project. We don't call this a project. We say irrigated from the waters of the Willow Creek.

Q. It has, as a matter of common knowledge, resulted in ruinous loss to people who have gone in there because of shortage of water; isn't that true?

529 A. There was one orchard company abandoned an orchard due to the fact that they were short on water. Seven miles above them there is a large acreage of orchard land producing good crops on a limited water supply, in the Brogan section.

Q. Now you say there have been some shipments of lambs from the northern part of Lake County down on that branch line railroad to the Southern Pacific and then over to Ogden and then around and back to Ontario; is that right?

A. I was talking over this matter with a man just out of Ontario who feeds lambs and he told me that two years ago he fed a bunch of lambs that came from out in the Silver Lake country. I asked

him, I said, "How did you get them over here?" He said, "They came in by train from Ogden." Now how else could they have come excepting through——

Q. They came in by train from Ogden? (978.)

A. Came by train from Ogden, was his statement. That is all I know about that particular case. They were lambs.

Q. Why didn't they bring them by truck from Silver Lake over there to the Oregon eastern branch?

A. Well, it is quite a job to truck two thousand or three thousand lambs. The roads are not very good for trucking, and it would not be possible to do it successfully. There is not enough trucks in the country over there to haul them out.

Q. There is not an acceptable road, or a moderately fair road?

A. Oh, there is a fair road.

Q. From Silver Lake across to Burns, is there?

A. Yes; there is a fair road through there, but there is not enough trucks in the whole country. You would have to import half of the trucks from the Willamette Valley to get those sheep across.

I would not say those roads are mere trails through the greasewood and alkali flats. They are fairly passable desert roads.

529 (979.) I have never gone from Burns to Bend. I have gone from Burns to Lakeview a number of times and from Burns to John Day and from Silver Lake to Lakeview a number of times. I have traveled that road a number of times in the last few years. There is an automobile stage line from Burns to Bend. I think they have a daily service. They drive a Lincoln car. They also have a stage running from Lakeview to Burns showing that those roads are passable all right. Most of those roads are county roads. Some of them are receiving State aid. What is known as the Central Oregon Highway from Bend to Burns is, I think, designated as a State road. That is approximately 30 miles north of this railroad location.

Q. This corn that you are going to ship out of the Malheur country, do you know how many carloads of corn is shipped into southern Idaho every year? You know there is a substantial volume of shipment from the east into southern Idaho, do you not? (980.)

A. I presume that there may be some come in, although I don't see why they should ship in there necessarily. They simply haven't developed their corn acreage, or they are growing perhaps crops which might bring in more per acre return to them.

We have not reached the point of production where we can supply them as yet. Our sheep men buy their corn for feeding during the February lambing. Our dairymen and poultrymen use a limited quantity of it, too. (981.)

As to whether our people who are engaged in agricultural pursuits in Malheur County are generally prosperous, we have some prosperous farmers. On the whole, I wouldn't say that they were particularly prosperous. As to whether they are suffering from the general depression in agriculture that we hear so much discussion

about, they have been in the last five years, at least, suffering from low prices for the commodity they have grown. They have been able to grow sufficient quantities but they haven't been able to secure the prices they should get for it.

531 Q. And in that situation do you think it is a wise policy to continue this artificial stimulation that we see in these irrigation projects, bringing in more of these wild lands into agricultural condition, with the condition it is in at present?

A. Well, may I ask you whether or not——

Q. I am asking your opinion as to whether you think it is wise——

A. Well, are we building these irrigation projects for use to-day, or are we building them for permanent improvement of this western country? Population, the normal increase in population, is going to consume tremendous quantities of food products within a comparatively few years. We are not building these things for to-day. We are building them for perhaps ten years from now, a lot of them. We are pioneering this country. (982.) At one time railroads were very glad to build into new territory and build across new sections of country to aid in the development of them. They were pioneering, and a lot of our irrigation work to-day is more or less pioneering work. We don't need them to-day, perhaps.

Q. Do you think it is wise, then, for the present generation engaged in agriculture to sacrifice its prosperity and enjoyment of life for another ten years on the expectation that population is some day going to catch up with all of this wild-cat promotion we have had in agricultural lands?

A. Oh, our little project over there, Mr. Dey, doesn't mean a drop in the bucket in the total consumption of food stuffs; it is only a small amount, and as far as the Owyhee and the Vale projects having any effect upon price of food commodities or agricultural commodities there isn't enough of it to even—to even dent the surface.

Q. Well, if your own local people there have been unable to dispose of that which they have raised, and dispose of it at a
532 fair price to enable them to get along comfortably and with fair prosperity, do you think it wise to bring in right around them additional lands?

A. We have men, Mr. Dey, that to-day are farming that land and are making more money off of that land than they could do in any other line of business. They are prosperous. We have outstanding examples. (983.) Our good farmers, those farmers are not doing a thing that any man couldn't do if he had the same mental or perhaps other abilities to carry out the job. They are making money, and it is part of the agricultural college business, my business, to try to get those men lined out on a type of farming that will enable them to produce crops which they can sell at a profit. We can grow our clover seeds, we can grow poultry, we can produce dairy products, a number of things that we can grow right there that can bring a profit to the producer, and as far as talk about hard times, and all of those things, if you will check back a lot of your hard times talks

they are coming from men that perhaps are not using their natural abilities to the fullest extent; they are perhaps weak in some way. We have got prosperous men over there, and some that are not prosperous.

Q. Well, I understand your competent farmers are prosperous.

A. In practically every case our competent farmers are prosperous.

Q. Under the transportation facilities and under every other condition that exists over there.

A. Well, they are producing stuff, but they aren't becoming rich, but they are paying their bills and getting by and coming out at the end of the year in pretty good condition.

Q. And some of them, as you said a little while ago, are making more money than they could in any other line of business? (984.)

A. Well, that is true, perhaps.

533 Exam. ROGERS. We haven't had in this case much about agricultural depression. I rather gathered from the newspaper reports and other reports that there wasn't any such animal. I was just wondering if you were putting a hypothetical question to this witness that wasn't based on the facts?

Mr. DEY. Well, my purpose, Mr. Examiner, is to find out what these experts, county agricultural agents, graduates of our college here, supposed to be the best equipped in the State, think about this proposition of keeping the production ahead of the consumption. And I gathered from the witness' answer that he thinks that is the proper thing to do, to go ahead and bring in more of these irrigation projects.

A. Are we keeping our production ahead of our consumption? Aren't we importing each year quite a quantity of food stuffs in some lines and exporting others? Doesn't the balance come out just about even, when all is said and done?

Q. (By. Mr. DEY.) Well, outside of the construction of the cross-State line, what else have you got to suggest to bring prosperity to people engaged in agriculture in your country?

A. Well, perhaps a different—a little different type of diversified farming, and that is a long, extended subject that I don't know enters into this case particularly. (985.) We have got examples there of men who can farm under present conditions, even, and do it successfully.

Q. Well, the solution of their present difficulties hasn't been dependent wholly upon the construction of the cross-State line, I take it?

A. Oh, not wholly, no.

Redirect examination:

Q. (By Mr. MCCULLOCH.) Mr. Larson, did you want to be understood as contending or claiming here that the products of Malheur County, to Portland and to points nortl. of Portland would

534 go normally or naturally by the cross-State line and thence the Southern Pacific to Portland or beyond Portland, in

preferece to the Oregon-Washington Railroad and Navigation Company line through Huntington and up through Pendleton, and down the Columbia River?

A. Well, I really am not prepared to state just what would take place there. That would be a matter of rate adjustments and other factors which might enter in which I don't feel prepared to testify upon. (986.)

Q. Well, you hadn't investigated, had you, the comparative distances, or were you making any contention that the products of Malheur County that would go to Portland as a market, or Seattle or Tacoma, points north of Portland, would be routed by the cross-State line and Southern Pacific instead of the existing line?

A. No; I have made no such contention as that at all. I believe in my testimony I tried to give the impression that so far as Portland markets were concerned we were being pretty well taken care of, but we are not reaching Eugene, Marshfield, and other central Oregon—central western Oregon points.

Q. And you mentioned, also, did you not, in that connection, northern and central California markets?

A. Northern and central California markets we are not reaching at all.

Large shipments of livestock, sheep, and farm animals are being made eastbound on the Union Pacific branch from Crane to Ontario. Generally speaking, those shipments originate around Crane, Juntura, and Burns. (987.) As to whether any of them come from out of the Fair Valley, tributary of that line from Burns to Seneca, I understand that Grant County is shipping quite a little livestock over that route at the present time.

I have been over a good many times the country west of Burns and Crane to Silver Lake, and then west of Silver Lake over the Christmas Lake and Fort Rock countries, but I have not been over the direct route of the proposed cross-State line.

There is a production of sheep and livestock in northern Lake County and northern Harney County between Burns and Silver Lake and on west. I couldn't say as to the numbers of head that run in there, but I do know that what is commonly called the Fort Rock desert and Sycan Marsh, and the country in northern Harney County, and all through there, supports a large number of both cattle and sheep. Sheep are wintered in northern Lake County. (988.) Practically all of the sheep of Lake County—and Lake County is one of the heavy producing counties in Oregon—practically all of those sheep are wintered out there in what is known as the high desert; they go out there about the middle of September or first of October, as soon as they get rain or a little snow to provide water; those sheep remain there until the water supply is exhausted in the spring, and they then have to move out onto the summer ranges where they have water.

Q. Mr. Larson, in that territory you have just been speaking of west of Burns, the Silver Lake country, Christmas Lake and Fort Rock country, and Sycan Marsh, do you know whether there are supplies of natural forage that sheep and range cattle will eat?

A. There is a supply, and the only reason that they don't utilize more of it is, as I said a while ago, they have no water during the summer months. It is known as the high desert.

Q. Well, do you know whether in that territory where they haven't water in the summer months water is procurable by th drilling of wells?

536 A. It is in the Fort Rock desert, I know.

Q. What do you know about that?

A. Well, I know that in my experience in Lake County I worked considerably with three different ranchers in the Fort Rock desert who have wells that they are pumping from. (989.) Those wells are approximately 200 feet deep, that the water rises within forty feet of the surface of the ground. In one of those wells they have a thin-inturbine pump, which ran 50 days continuously during the year 1925 and never lowered their water a bit. Now, that pumped there a volume of water of about a thousand gallons a minute.

On another well, about three miles from there, a 12-inch centrifugal pump was installed, and that pump had an efficiency of almost 2,000 gallons per minute, and it was run almost continuously, throughout the summer.

Q. (By Mr. McCULLOUGH.) Mr. Larson, do you know whether in that country the water from the wells that have been drilled is used for livestock? That is, does it furnish water for any livestock, sheep?

A. A considerable number of livestock, particularly cattle, is being watered from one or two of these wells. (990.)

Q. For what distance adjacent to a well of this sort would you say it would be feasible to supply cattle or sheep with water?

A. Oh, cattle would come in possibly ten or twelve miles to a central water supply. Sheep would come not quite so far.

Q. In your judgment would the drilling of wells at various points in the country adjacent to the line of the proposed cross-State route, and with the transportation facilities that that would afford for the movement of cattle and sheep out, the movement of farm sup-

537 plies and pay, if necessary, in, could the country tributary to the proposed cross-State line support an extensive livestock and sheep industry?

A. They could support a great deal more than they are at the present time, because, as I stated a while ago, they are limited by water. There is a large amount of natural forage growing on that land which can only be utilized the time of the year when they have water naturally, from snow, rains, and agencies of that sort, and if artificial water were supplied a great deal of that so-called present desert would be supporting livestock throughout twelve months of the year, as it is doing where they have one or two of these wells.

Recross-examination:

Q. (By Mr. SPENCER.) It isn't possible for the Fort Rock country to put water on its lands on any such economical basis as is done over there in your country in the Malheur, is it? (991.)

A. Well, I don't believe that they can pump quite as efficiently or economically as we can apply gravity water. (992.)

538 W. V. WAGNER was thereupon called as a witness on behalf of complainants, and, having first been duly sworn testified as follows:

Direct examination:

I reside at Payette, Idaho. I have been there eight years. I am secretary and general manager of the Farmers' Cooperative Creamery. We have our main plant at Payette, Idaho, with a branch plant at Weiser, a branch plant at Ontario. As manager I have complete charge of the operations of these plants and the selling of our commodities, any other duties that come under the management of the business. (992.)

Our creamery gets its supply for operation from Gem County, Payette County, Washington County, Adams County, in Idaho; Malheur, Baker, and Union Counties in Oregon; seven counties. I am familiar with the conditions in those counties for the production of butter, poultry, and eggs.

As secretary of the Farmers' Cooperative Creamery I am custodian of the files and records of the company. That company was organ- in August, 1915. I have prepared an exhibit for this case showing the development of the Farmers' Cooperative Creamery at Payette and Weiser. The paper you now hand me is the exhibit which I have prepared.

This is in part my exhibit. It simply shows the date of organization of our institution and its growth from that time. We organized in August, 1915, and our operations amounted to (993) practically nothing the balance of the year, so our records really start with the year 1916.

We manufactured in 1916, 200,440 pounds of butter. I estimate we will manufacture in 1928 four million pounds.

Our company had four hundred stockholders in 1916. On July 1st, 1928, we had 3,455 members.

539 (Said statement was thereupon received in evidence, marked "Intervener's Exhibit No. 18, Witness Wagner".)

We market our butter principally in California. We have been shipping practically all our butter to Los Angeles. However, we maintain a selling association in (994) Los Angeles and San Francisco. That association is the Challenge Cream and Butter Association. We sell some butter in San Francisco. In making our shipments from Payette and Weiser our car originates at Weiser, is finished at Payette, and is dispatched over the Union Pacific by way of Salt Lake to Los Angeles. By that way of shipment Weiser gets the credit of the car. I said we sell some butter in San Francisco. (995.)

The proposition is this, we maintain a selling association in each city, and at the present time we are shipping all butter to Los Angeles and it is being stored in Los Angeles and supplied to San Francisco from time to time, in order to equalize the two markets. When we started our branch house in San Francisco it was done for the purpose of equalizing the butter markets between San Francisco and Los Angeles. We had found that the brokers in San Francisco were buying butter from the Middle West, shipping to San Francisco, transferring it by water to Los Angeles, and competing with our butter in Los Angeles, and also making a profit for themselves, on account of the San Francisco market being lower than the Los Angeles market, so our coming into San Francisco was for the purpose of equalizing this market and giving better and more even distribution between the two cities, and the butter that we ship now to Los Angeles a large part of it is being transferred to San
540 Francisco and consumed in San Francisco. We do not ship directly to San Francisco because the warehousing facilities are better at this time at Los Angeles. The rate is the same. Our main house is in Los Angeles.

We are shipping two cars of butter per week regularly. It would amount to 104 cars for the year. I might be one or two cars off there on account of there being possibly more than (996) 52 weeks in some cases in a year. I haven't compiled it for the year, but by the week.

The rate on a carload of butter from Weiser to Los Angeles is $1.66. As far as freight, it depends entirely upon the time of year. During the flush season, those cars are heavier than during the normal season, we will say an average from five to seven hundred dollars per car freight.

We have invested in our creamery plants and machinery in Payette and Weiser $250,000.00.

Our two plants have a capacity for doubling our volume, or, in other words, without further expanding we could manufacture eight million pounds of butter annually.

We have been expanding our creameries at a rapid rate for the past five years. Our production caught up with our capacity at Payette, and it was necessary to build to take care of this increasing production, so we built the plant at Weiser to take care of the north end of our territory.

We have been disposing of our butter in the California markets since the latter part of the year 1921 or beginning of (997) '22. Prior to that time our markets were the East—Philadelphia, Chicago, New York, Boston, and so on.

Our conditions are much better today than they were in 1921, when we were shipping East. From the time we organized in 1916 up to the year 1920 or '21, although we had grown considerably,
541 the advancement or growth was not as pronounced as it has been in the last six years, due to the fact that by shipping east and selling our butter to any one we could, and paying the high freight, we couldn't make the returns to our producers that we have

made since we started our own association in Los Angeles. Since about '22 we started there and have developed this selling medium, and our records show that we have paid more to our producers than they could have gotten elsewhere, which we attribute to being able to sell direct to the dealers at the lowest possible cost, making greater returns to these producers. This statement will reflect something has caused a rapid development in our business, and we attribute this development to being able to sell on the California markets and getting a better price.

The financial condition of our company about the (998) year 1920 was that it was practically insolvent. To-day the assets of our business is about $250,000,000, with absolutely no indebtedness, not a dollar.

I do not think the dairy industry, in my territory would have developed like it has without the California markets. As I have just stated, we attribute this development, this advancement, to the fact that we have maintained our own organization in California, made a saving in freight rates, gotten more for the product, and made greater returns to our producers.

We also deal in poultry and eggs. I can't intelligently give you the volume of poultry and eggs, as we started the poultry and egg business in the middle of the year 1927, and 1928 is incomplete. I couldn't give you the annual business, but I would estimate twenty cars of poultry and ten cars of eggs. That is for the year. (999.)

542 I have made a survey as to the extent of the production of butter fats, eggs and poultry in the district I now get my supply from. The estimated amount of butter that we will manufacture at our Payette and Weiser creameries in 1932 or '3 can only be based upon past records. If we make the same gain in the next five years that we have in the past five, which will run around four hundred per cent increase, we could add that four hundred per cent increase to the present volume. We anticipate a good deal larger business in the next five years than we have had in the past. In fact, we are making arrangements to that end in building these other creameries and expanding.

As to how many carloads of butter we would have for shipment in 1933 that is entirely problematical. As I said, we couldn't base it upon carloads. If we had a high production the year around we would ship big cars, we would ship much larger cars than we are now shipping, but you take the volume for 1928, or four million pounds, there is an increase over 1923 of approximately three million. If we get that same increase (1,000) in the next five years it would naturally mean about seven million pounds of butter we would be putting out.

The future for the poultry and egg business looks very bright. The farmers in that vicinity are going on the diversified plan more and more all the time; they are raising more poultry, producing more eggs, milking more cows, than ever before.

In case the proposed railroad is built I would ship all of this butter over it, if they would haul it, provided the freight rate wasn't any higher than it now is. I would ship over that railroad because of the shorter haul. I don't know exactly what the time would
543 be cut, but we are assuming possibly twenty-four hours. Another reason for shipping over that road is there is a saving to us with regard to quality. The quicker we can put our commodity on the market the better the quality. The better the quality, the higher the price we get, the greater returns we can make to our producers. Such is the case particularly with poultry. For example, a shipment of live poultry is quite an item where twenty-four hours could be saved, (1001)—there is less shrinkage on the poultry, less feed en route, less time for the carman, and so forth. Also, we feel that we could effect a saving in refrigeration by the northern route instead of the southern. At the present time, it is costing us $55.00 per car to refrigerate to Los Angeles. That is on the basis of the cost of ice, $55.00 flat charge. That contemplates movement via Salt Lake. At present we ship all of our butter via Salt Lake.

Now, as stated, we are compelled to refrigerate the year around where butter goes over the southern route, because you can't depend on the conditions across the desert from Salt Lake to Los Angeles. There would be times this other way when we would only ice at the point of origin and wouldn't re-ice in transit. That would be a saving of twenty per cent on the icing charges. In the winter time we wouldn't ice at all on butter cars, we would ship entirely without refrigeration, if it could go the Northern route. Those savings, practically all (1002), would affect us, betterment of quality, quicker time, quicker returns on our products, and saving in refrigeration charges, and so forth. Those savings or charges would accrue to the benefit of the farmers or the dairymen. Our organization is purely a cooperative organization. We return everything that is real-
544 ized between the sale of our product, after deducting expenses, to the producers. That is one reason of our success. Our farmers have confidence, they know that they are getting all this and that feature has built up our business.

As manager of the Farmers' Cooperative Creamery at Payette, I am interested in the construction and operation of the proposed railroad, requested in the petition of the Public Service Commission of Oregon, for the reason that I am representing 3,455 dairymen in that section of the country—that section of southwestern Idaho and eastern Oregon who are demanding an outlet of some nature to the northern California markets. These people feel that they are isolated with regard to rail transportation for northern (1003) California, and they are to a great extent. We have often pictured our position geographically with western Kansas or eastern Colorado, that is, with respect to rail transportation to northern California. For example, if we were to cut the Union Pacific line in two at Payette, Idaho, and swing it around east of Salt Lake City it would reach out to a point in Colorado or possibly western Kansas, or in

that section of the territory, so we feel that that is our position, geographical position, with respect to northern California markets. We have no outlet to northern California whatever except around by Ogden. We are between four hundred and five hundred miles to Ogden, and no closer to San Francisco, possibly a little farther away, than when we started.

It is unnecessary to travel so far before we start toward California, if it can be avoided. There would be no use to go down to the Multnomah Hotel by way of the depot if you could go straight through, the way I look at it.

545 The people in the territory in which our creamery operates are vitally interested in the construction of this road. We hear it continually at our picnics and meetings over the country. We carry on a series of picnics throughout the year, get the dairymen together, discuss (1004) matters of business which interest them and their business, and we hear this very often—they are insisting upon and demanding some kind of an outlet to California. The only alternative would be, if they couldn't get rail facilities, to build a highway. That has been discussed.

I should say that the experience of the Farmers' Cooperative Creamery during the years that it shipped its butter east, compared with the experience it had since it commenced supplying California markets has had something to do with the sentiment in that country. We acquaint our producers of our conditions, advancements, and so forth—they know what has brought about this increased prosperity to them. It is their being able to sell on the California markets.

I am acquainted with the dairy industry in southwestern Idaho, in the ten southwestern counties. There's the Farmers' Cooperative Creamery at Payette, and the same institution at Weiser, would be called two plants; Jensma Creamery Company at Nampa (1005)—in all nine creameries. Jensma Creamery Company is located at Nampa. The Nampa Cooperative Creamery has closed its doors.

The Department of Agriculture requires of creameries in Idaho a monthly report of your manufacture on all commodities, the butter manufactured, ice cream manufactured, cheese manufactured, and so forth.

Mr. THOMPSON. I would like, if there are no objections, to in-

546 troduce an exhibit at this time showing the markets for southwestern Idaho products, dairy and poultry development. It was made up in my office. I would like to have it introduced.

(Said statement was thereupon received in evidence, marked "Intervener's Exhibit No. 19, Witness Wagner.") (1006.)

As manager of the Farmers' Cooperative Creamery at Payette, I wouldn't say it was absolutely necessary, in order that the dairymen, poultry and egg industry of the territory from which our creamery draws its supply of butterfat, eggs, and poultry, develop or make the development which it is entitled to make, that this proposed line of railroad be constructed. But I would say that the construction of this road would better conditions. I believe it would give us greater

returns to our dairymen, which would in turn develop faster the dairy industry in southwestern Idaho and eastern Oregon. (1007.)

I am generally familiar with the facts and figures stated in Exhibit No. 19, concerning which I have just testified. I believe it states the true conditions as purported to be shown by that exhibit. It is compiled by the Department of Agriculture of Idaho, and we find them usually correct.

In the main, the industries concerning which I have testified are carried on largely on irrigated lands. It is incident to the usual development of irrigation projects. I believe the development of butter and poultry industry will increase in proportion to the increase in irrigable acreage developed. (1008.) There is no doubt but that the development of the Owyhee and Vale districts and the Black Canyon district will have a tendency to greatly increase the production which is shown in my exhibit.

547 The San Francisco market and the Los Angeles market are the same, practically so, figuring upon an aevrage basis. There would be times when the Los Angeles market was higher, and vice versa. The idea of shipping to San Francisco, our association in California would save—the San Francisco market would be supplied at all times without having to divert from Los Angeles. Some of our associations, those who are close to San Francisco, are sending their butter there, namely, the Modesto Creamery, the Riverdale Cooperative Creamery, in California, but those creameries cannot fully supply the demand in San Francisco, and there has been talk for some time that our entire volume would be diverted to San Francisco instead of Los Angeles. (1009.) When I speak of diversion, it is really not a diversion—it is a re-shipment from our Los Angeles to San Francisco plant.

Q. And is it your idea that a very important advantage accruing to you would be the fact that after your shipment arrived at San Francisco it could be re-shipped to Los Angeles without increasing the total distance materially?

A. Well, there wouldn't be so much butter to be shipped from San Francisco to Los Angeles as now is being shipped from Los Angeles to San Francisco. It would lessen the amount to be sent down there.

Q. Had you, in your statement, given consideration to the fact that your butter could travel via the cross-State line through San Francisco and on to Los Angeles at approximately the same total length of haul that it now travels in going direct to Los Angeles through Salt Lake?

A. I understand the distance is about the same. With regard to refrigeration that situation would be an advantage in connection with our shipments.

548 Q. Now, what is the fact, if you know, as to whether or not large quantities of the product which you ship to California markets, and which you say you would ship to San Francisco, are actually shipped into San Francisco from points more (1010) distant

than southwestern Idaho, and that there is a market there for your product to fill?

A. You will understand that those—speaking of the Los Angeles and San Francisco consumption of butter, it is only the product which is manufactured by these several cooperative creameries, and there are certain channels of trade to be supplied with the Challenge Cream and Butter Association; and they would ship that butter from Los Angeles to San Francisco rather than buy it from other sources, so we know nothing about other creameries' product that will come in there to supply. I have made sufficient investigation so that I know that there is an adequate market to take our supply.

In what I have said as to advantages I have given no thought or consideration to any advantage that might result through possible reduction in (1011) rates due to shortening of distance.

Mr. McCULLOCH. Mr. Wagner, do all of your company's shipments now move west into California, or do you ship some east as well?

A. Well, there are times, for example, in April the eastern market was four or five cents higher than the coast market, and we shipped four or five cars, that is, from our Idaho creameries. We have four creameries in Idaho which constitute this membership, and we shipped a few cars back about March and April to the eastern market, in an effort to equalize the markets.

549 The very great proportion of our shipments normally move to Pacific coast markets. We sell our products at a price that contemplates delivery at destination. That is the reason our company has found it decidedly advantageous in the interest of its members to transfer the marketing of its products to the nearby Pacific coast markets (1012), rather than the distant markets on the Atlantic seaboard.

Exhibit 18 shows that our business increased from 1916 from two hundred pounds plus to an estimated to manufacture in 1928 of four million pounds. It has been my experience in the past that demand for those products has kept pace with the increased production. We cannot supply our demands. Our association in Los Angeles is planning a half million pounds a month of outside butter to supply the demands of the association.

Based on my past experience, we do not anticipate any overproduction in the southwestern Idaho counties, even with largely increased areas of irrigated land, in poultry, eggs, dairy products, which will have any difficulty in finding a consuming market. We feel that such an increase as our company's business has shown in the past five years may be reasonably anticipated for the coming five years.

Q. Have you any doubt in your mind, as you are acquainted with market conditions, that if there was an increase in production of four hundred per cent in the next five years that the markets on the Pacific coast would readily absorb that increase? (1013.)

A. Our association is selling fifty-six per cent of all the butter consumed in the vicinity of Los Angeles, which includes those outside towns like San Bernardino, San Diego, Long Beach, and so forth, and their demands for butter is increasing all the time. We can't supply the demand. Furthermore, consumption is increasing in the California cities with the influx of population into that territory, and it now develops the fact that it requires more than three hundred thousand cows, new cows, each year on the watershed west of the Rocky Mountains to supply the increased demand on the California markets.

Our company does not ship any sweet cream. We have never. We made an effort to at one time, but the California law, or particularly the city ordinance of Los Angeles, rules that cream cannot be consumed or offered for sale when it is more than forty-eight hours old, and we can't reach it within that time.

It takes seven or eight days on the average, for a car of butter loaded out from our creamery to get to Los Angeles. That is the best time that has ever been made. (1014.)

Cream can't be sold after it is forty-eight hours old in Los Angeles. That is the time between the time it is drawn from the cow and offered for the consumer. That is the general rule. That would be true of San Francisco.

I would like to make, if you please, a little more comment on the possibilities of the dairy business, the growth of the dairy business in our territory, which has not been brought out by questions.

Due to the hoof and mouth disease in California, so many cows dying and being killed in that vicinity, there has been a great demand for cows in Idaho, and it has drawn great numbers of cows out of our territory. I am not in a position to say how many. I haven't kept track, but then I know a great many. For example, it is estimated that twenty-five cars were shipped out of three or four points in that section last year, but I won't be positive as to the number; and in an effort to stop that and hold these cows into our territory we have organized a loan association, and we loan money to the dairymen, giving them twenty months to pay this loan, which is five per cent of the loan per month taken out of their cream check. This loan association has been in (1015) operation a year, and we have loaned, up to date, we have made 243 loans, amounting to $105,985.03. We find that this is a very effective medium for putting new men into the dairy business, helping develop the dairy business, and keeping those cows from being taken out of our territory to California, and with the fact before us that we have increased four hundred per cent in the past five years, and with this assistance that we have to produce it, we can see no reason why we should not expand even more in the next five years.

Cross-examination:

We do not ship to Portland or to Seattle. We do not sell to Swift & Company as a rule. There was a time last year—last March—Swift & Company were short of butter, made us an attractive price

on a car, and we sold them a car. But as a rule we do not sell. That is the first car of butter we have sold to Swift for years. (1016.)

I know nothing about the rates either through Portland or via Ogden or Wells. We have never shipped over the route through Wells at all, for the simple reason that it is entirely out of line with us. We would have to transfer from a point down there
552 close to Gooding. (1017.) As I understand, the Wells cut-off is out of Twin Falls and we would have to, from the main line, go over to Twin Falls to get on this line.

The railroads do not route our shipments; we specify the routing. We do not sell either f. o. b. shipping point, or at destination; our butter is handled by ourselves in Los Angeles. And that is true in San Francisco.

If the cross-State line were built we would ship our Los Angeles butter via the cross-State line, instead of through Salt Lake, provided the rate were the same. There would be another condition in there—we would have to make as good time and receive as satisfactory service as we do now. (1018.) We have no complaint whatever of the service we receive from the Oregon Short Line. The service is perfect. The Short Line has worked along with us over there in a pretty earnest way to bring about this condition that obtains in the dairy industry.

Q. Well, if you had optional routes, would you take the business away from them and ship it down over the Southern Pacific, or would you continue to ship it to Los Angeles by the Union Pacific system lines?

A. Well, we would ship the cheaper way and the better way. We wouldn't take any business away from the Union Pacific and give it to any other road with malicious intent, not at all.

I know the physical condition of the roadbed and facilities of the Oregon Short Line and of the Los Angeles & Salt Lake all the way through, on the main line. As to whether I would anticipate that any such favorable condition as that could be developed within any short period of years by building a line across central Oregon
553 (1019), well, if they built the line from Crane—they have a good road out to Crane—if that road is built on out to the main line of the Southern Pacific, or the branch line we may call it, we can't see why that roadbed shouldn't be as good as any other roadbed. The roadbed from Ontario to Crane does not now compare with the main line, but then it could be with a reasonable amount of work, I should think. No doubt it would require the expenditure of large sums of money to do it. And that is true of building a cross-State line. It is true that this traffic is what has built up the present physical condition of the main lines of the Short line and the Los Angeles & Salt Lake.

Q. Now, if you take it away from them, what is going to be the advantage on their operations and on their ability to serve?

A. I don't know what the result will be, I am sure.

Q. Well, it is just within a few recent years that southern Idaho has come into such happy commercial relations with Los Angeles, isn't it? (1020.)

A. Yes.

Q. And your industry has been one of the principal ones to accomplish that relation?

A. You bet!

Q. Yes. It is just as short a route, and a little shorter than it would be via the cross-State line and the Southern Pacific, isn't that true? Or have you checked that mileage?

A. I am told—now, I am not in position to state what the exact difference would be—I am told the distance is about 400 miles shorter over the proposed route than the other way. That is to San Francisco. The distance to Los Angeles—I don't believe there would be a very great deal of difference but I haven't checked to see. But it is true there couldn't be a very great difference in the distance.

554 And we are not asking for better service, or any of those things to Southern California. It is simply an outlet of (1021) some nature to the northern California markets.

Now, assuming that the distance from Payette—that is one of our shipping points—to Los Angeles via Salt Lake is 1.135 miles, and the distance via Crescent Lake is 1,201 miles, the matter of distance would favor the present route to Los Angeles by 66 miles.

As to whether if we could use this Wells line from Payette, our distance would be 1,002 miles, I haven't checked it. But the Wells line doesn't appeal to us, for the simple reason that it is out of line to us.

Now, the other day we had a car of live poultry to San Francisco. The matter came up of sending it over that cut-off, as we wanted to finish this car at Twin Falls—we were about 3,000 pounds short in weight—and the car was ready to go on this train, but I was informed that we would miss connection at Minidoka or this other point with this Wells train, and we had to send that car around by Ogden. The service on that Wells (1022) cut-off isn't right. We can't control the time that we load a car of poultry—and to hold it 24 hours in the yards there would be suicide for us; the shrinkage would be terrible, and they would die in the heat. So for that reason that cut-off doesn't adequately supply the demands of southwestern Idaho. If that cut-off was farther up this way—for example, if that cut-off went from Murphy or Nampa south to some point—I am not telling you where to build a road, you understand, but if it was further up this way——

Q. You wouldn't be any more different than the rest of them on that. Just go right ahead. I just want to get your notion.

555 A. Well, I am not telling you where to build that line, but I am saying if we had an outlet from Nampa or Murphy south this would never come up, we wouldn't ask to have this other road, because it would have gratified the demands of southwestern Idaho.

Q. But with the Wells line there has been no change in the bulk of the traffic—it still goes around to Odgen, because that service is so much better; and to have this service you have got to have volume, don't you?

A. Yes.

Q. And to have volume you have many more train operations than you would—— (1023.)

A. Your Wells cut-off was built there to gratify the desire of the Twin Falls people, and you haven't enough business there to give you service. If you would arrange for better connections and divert a lot of this traffic that goes around by Ogden through that way you would have better service and could maintain daily trains. If you had daily trains I am sure that a lot of the traffic would go through there.

Q. Well, business even in the Twin Falls country comes up and goes around through Ogden, doesn't it?

A. I am not acquainted with that. I know very little about it.

The Meridian Produce Company is at Meridian, Idaho. It is on the Boise cut-off. I understand that is considered a main line now. They ship some down through the Wells line to San Francisco. As to why if they can do it we can't do it: They have a house in Twin Falls. They are shipping from Twin Falls, not from Meridian. (1024.) That is, not to any great extent. There has been cases where they loaded part at Meridian and then filled out at Twin Falls, but as a rule they don't.

556 Now, I was talking about seven or eight days to ship down to Los Angeles. As to whether, ordinarily, that much time is consumed in the shipments from Payette: We find that seven to eight days is the time in every case. If we wanted quicker service I don't know whether we could get it there any quicker. I haven't asked. I am assuming that that is the best they can do in taking it there.

Exam. ROGERS. What is the fact as to the use of this cut-off—does the carrier take the unrouted traffic over that cut-off, coming from the west on its line or does it take it around through Ogden?

Mr. SPENCER. I don't know. How about that? The unrouted traffic? The general freight agent says, would go via Wells.

Exam. ROGERS. It does go via Wells?

Mr. SPENCER. Is that the fact, Mr. Godwin? (1025.)

Mr. GODWIN. The Wells gateway is the direct line from western Idaho to San Francisco.

Exam. ROGERS. If you get an unrouted shipment, which way do you take it from western Idaho?

Mr. GODWIN. Well, the operating department would handle that via Wells. We have had very few of them. None of it has come to my personal attention.

Exam. ROGERS. Most of the traffic is routed by the shipper now?

Mr. GODWIN. Yes, sir; for some reason or other he routes it via Ogden. (1026.)

Q. On page 4 of Exhibit No. 19, which is the exhibit prepared in Mr. Thompson's office, the last tabulation on that page, which is the last tabulation of the exhibit, gives the origin of dressed poultry that is consumed in the San Francisco and Los Angeles markets, and it shows that at San Francisco 20 per cent of that market is furnished by Idaho, Los Angeles 18 per cent by Idaho, and then at San Francisco it says 57 per cent of that market is furnished by other coast States. Now have you any knowledge as to what that means, other coast States? What States produce that?

557

A. That would be Utah, Oregon, Washington.

Q. Does Oregon furnish a substantial part of that, do you know?

A. It does.

Q. So that the completion of this cross-State line will in your opinion permit your poultry growers of Idaho to come into more effective competition with the poultry growers of western Oregon in the San Francisco market?

A. I don't believe you would call it in competition with them. The Idaho and Oregon growers would be enabled to ship their poultry into the San Francisco market at less cost.

Q. Well, it would not help the poultry growers of western Oregon any, would it, to have this cross-State line? They would not use it any, would they?

A. Western Oregon, no; I would not think it would help the (1027) poultry growers of western Oregon.

And that is where the poultry of Oregon is raised, largely. But you understand we are working for southwestern Idaho and eastern Oregon. We have eliminated western Oregon in the argument.

Q. Yes; and it is a fact that your contention here is that you want the cross-State line in order that you may put your poultry and other products into the San Francisco market in more effective competition with the producers of the same commodities in western Oregon, who now supply that market to a large extent?

A. It is going to San Francisco as it is. I can't see that it would be in competition.

It is not going to Los Angeles according to my own figures. The poultry is going to San Francisco. We ship no poultry whatever to Los Angeles. Our butter now goes to Los Angeles, but butter is a different proposition. The butter you will find produced in western Oregon is largely coming to Portland and Seattle; it does not go south. There is very little western Oregon butter that goes to San Francisco. (1028.)

558

We cannot now supply the Los Angeles market with butter.

Q. Well, until you get that supplied, what is your need for shorter rail facilities into other markets?

A. We are buying about a half a million pounds a month from outside sources, principally coming from Colorado.

Q. For the Los Angeles market?

A. Yes.

Q. Well then, why do you want shorter routes into San Francisco when you can't now supply the market you have?

A. Well, as I stated, our market is in both Los Angeles and San Francisco, and we are endeavoring at all times to supply both markets; and by shipping to San Francisco we could ship to San Francisco at a saving and avoid having to ship so much butter that has recently been shipped from Los Angeles back to San Francisco. In other words, we cannot supply the San Francisco market as well as we can the Los Angeles, and it is necessary to ship a lot of butter from Los Angeles to San Francisco, which, by turning it around and shipping it over the cross cut, we could avoid.

Exam. ROGERS. If you can't supply the Los Angeles market, why do you ship any to San Francisco?

A. We can buy this surplus on the Los Angeles market better than we can on the San Francisco market. There is more surplus (1029) butter being offered for sale on the Los Angeles market; we can naturally buy it cheaper.

559 Q. (By Mr. DEY.) Well, I can't reconcile your statement.

A. You misunderstand evidently.

Q. You are unable to supply the Los Angeles market and at the same time you are buying a surplus on the Los Angeles market?

A. We are. We are buying a surplus, and we are buying that surplus for both plants, both Los Angeles and San Francisco.

We buy it all over the country, anywhere we can—Colorado, Wyoming, Montana. As to why we don't dispose of all of it in Los Angeles, since we can not supply that market: As explained, we find it advantageous to do business on both markets, Los Angeles and San Francisco. There is a condition existed there that was extremely hazardous to us. The San Francisco market was all the time lower than Los Angeles. The result was that brokers were buying this eastern butter, shipping it in there, transferring by water to Los Angeles and selling it in competition with our butter, and it was necessary for us to go into the San Francisco market in an endeavor to equalize and keep those markets equal. They should be equal; there is no reason why they should not be the same.

It is not our creamery association that (1030) does this buying; it is our selling association. But the board of directors and members of the selling association are the members of the Creamery Association. There is a director from each creamery on the board of directors of the Challenge Creamery Butter Association. For example, I am the director from Idaho on the Challenge board.

560 Redirect examination:

If we didn't get into the San Francisco market with our poultry at all, I doubt if western Oregon or Williamette Valley poultrymen would be able to supply the demand, or come anywhere near supplying the demand. The demand for poultry is extremely strong in San Francisco. We can't supply that demand, due to the fact that they are provisioning so many ships at the San Francisco port.

I can't see that there is any competitive condition existing between us and the Williamette Valley.

Mr. SPENCER. If I may ask one more question, they are shipping poultry east from California, San Francisco, and Petaluma, aren't they? (1031.)

A. You bet.

Mr. SPENCER. Then I can't understand why, if they ship east out of there, how it happens that they don't supply themselves, that they can't supply themselves.

A. Those are the things we can't explain; as regards poultry, poultry and eggs, California is an export market instead of an import; yet at the same time we can sell our commodities better in California than we can in New York. Why those things exist I don't know.

Mr. ELLIS. Just another question on that point: Isn't it a fact that your California egg producers have specialized and developed a particular class of trade in the eastern markets, and that that accounts for the shipment, large shipment east?

A. No doubt it does. The California egg producers all have henneries, and they produce a better quality of eggs than we do in Idaho, and that grade of eggs will command a better price in eastern markets than our eggs, and there is no doubt that that is partly the reason in so far as eggs are concerned.

As an economic proposition they are a better grade and they
561 will stand a longer shipment. And that condition exists the full length of the Pacific coast. (1032.)

562 H. M. NOLTE was thereupon produced as a witness on behalf of complainants, and, having been first duly sworn, testified as follows:

Direct examination:

I reside at Lakeview in Lake County, Oregon. At this hearing I represent Lake County Chamber of Commerce. I am one of the directors and chairman of the executive committee of the Lake County Chamber of Commerce. It is an organization comprised of members throughout the county, whose purpose it is to develop our resources and other industries which might come as a result of those resources. It is a county organization and not confined exclusively (1033) to the Lakeview section from which I come.

I have resided in Lake County seventeen years. During that time I have been engaged largely in real estate and insurance business. In connection with my business I have become familiar with Lake County and its resources. I am familiar with its transportation problems.

I have compiled some data in connection with timber tonnage that would be available to this line and extensions therefrom, as well as having made a reconnaissance over the area known as the Fort Rock Desert, that section lying east from Fort Rock to and beyond Christmas Lake.

As to the principal production of Lake County and what its principal needs are, so far as transportation is concerned—up to the present time our industries have largely been livestock, farming, and at this (1034) time it is beginning to develop into lumbering activities and dairying, poultry rasing, more intensified farming.

563 Lake County is 7,834 'quare miles. A considerable portion of that is covered with merchantable timber. There is in Lake County Fremont National Forest, and that probably covers two-fifths of the timbered area of the county, possibly three-fifths being privately owned, and the cruise on that is estimated at 14 billion. I say estimated; that is taken from actual cruises on private timber as well as the reconnaissance cruise on the Fremont National Forest. I might add to that that there is part of the Deschutes Forest in Lake County. That would be in addition to my figures on timber in the Fremont Forest. When I speak of privately owned timber and the estimates, I have in mind surveys or estimates that have been made by official representatives of my county. I made particular reference to the survey of reconnaissance survey of possible timber development as made by the Fremont National Forest, and I procured the figures from that office just a few days ago. (1035.)

There has been some reconnaissance or cruise of the privately owned timber as well in my county for taxation purposes, but investigation subsequent to that survey indicates that it is underestimated possibly twenty to twenty-five per cent.

The total figure of merchantable timber in my county is 14 billion. That would be approximately 6 billion in the Federal forest reserve and 8 billion private holdings.

Q. Where is that located with reference to any transportation facilities at the present time?

A. I would make reference to the Silver Lake unit or working circle, as referred to by the Fremont National Forest. That comprises the timber which lies south of a line drawn east and west through Fort Rock, that being the boundary between the Deschutes and Fremont Forests. That extends south to Yamsay

564 Mountain, which is south and west of Silver Lake, and then runnning south and east onto the Summer Lake rim, being on the watershed tributary to the town of Silver Lake and the lake itself. That unit contains 1,219,841,000 feet of timber. Privately owned (1036) 965,561,000 feet, making a total of 2,085,402,000. Now that does not include the forest that lies immediately north of Fort Rock and west to the Lake County line, with possibly, I would say, another billion feet available there.

In view of the fact that the Forest Service is adopting a policy requiring that the timbers within Lake County must be milled in the county, that is Forest Reserve timbers, the logical millsite for the timber I have just mentioned would be at Silver Lake or somewhere in that territory. There are logical and practical milling sites in that territory. Several creeks that run north out of the timber and into the Silver Lake Basin afford ample water, as indi-

cated by the Thompson Reservoir in that irrigation district. There are no railroad facilities within convenient access to that timber at the present time. I believe that timber would be served by the construction of the cross-State line proposed in this case because of the fact that the survey as originally made runs through Fort Rock.

Q. Now if the plan of the Forestry Department is carried out as to the milling of that timber, have you made any estimates of how much tonnage that would supply? (1037.)

A. The plan as laid out by the forest reserve is on the basis of a perpetual cut, and they made their estimates on a 50-year basis, and the Silver Lake unit, figuring just in round figures 2 billion
565 feet of timber, there is available there a cut of 2,000 cars per year for 50 years. Now that does not take into account the timber in the Deschutes Forest that lies immediately north of Fort Rock but lies within the boundaries of Lake County. For the upper grades of the timber the market is in the east, and just at the present time I might add that the lower grades of lumber which have been going into box shook, some of them are now being cut into what is known as common, and there is a demand in the east again. One of our lumber firms in Lakeview, one of the milling operations, Edgerton & Adams, just last week informed me that they were shipping dimensions east that ordinarily would go into box lumber.

Concerning the timber stand of our county and its ultimate use: With the possible construction of the proposed cross-State line we believe that an extension south from Fort Rock into this Silver Lake timber is justified; further, that there is a Summer Lake unit, which would provide 200 carloads of lumber yearly on the same basis of a 50-year cut; and (1038) that Paisley, south of that, what is known as the Albert Lake unit, the forest and private timber comprise 1,500,000,000 feet, which would afford, on the 50-year basis, 1,500 carloads of lumber yearly. This does not, of course, take into consideration other tonnage from agriculture and livestock, which I believe has been previously covered in the testimony of Mr. Teutsch.

Substantially all my figures of timber tonnage are calculated on the basis of a perpetual cut; a 50-year cut; and they believe that by that time the second growth, or, in other words the timber that was not cut in the first cutting would be available. In other words,
566 there is a limit on the size of trees; I believe anything under 16 inches is left, and that tree would be available in fifty years, together with such other timber as might grow.

Most of this timber that I have described is located in the western portion of Lake County. However, in addition to the Abert unit, which surrounds Paisley, there might be taken into consideration Warner Lake unit, which lies east of Abert rim, north and east of Lakeview. There is 1 billion 500 million in that. I didn't make a definite total of that, however, but I had the figures in the aggregate and that is approximately what it totals up.

The suggested millsite in the Silver Lake district would be approximately between 20 and 25 miles from Fort Rock. (1039.)

The timber from that area could be made tributary to the cross-State line by a branch of approximately 20 or 25 miles. Silver Lake is by road, which is almost direct, 19 miles south of Fort Rock, and the logical milling site there possibly would be anywhere from two to four miles south of that.

The Nevada, California & Oregon Railroad, which extends to Lakeview, serves Lake County at the present time. That was formerly a narrow gauge line. It was converted to standard gauge during the month of May, I believe, and service was established. I am not sure whether it is now controlled by the Southern Pacific Company. The same officers and management are in charge of the road, and all negotiations and transactions are carried on through the former offices of the Nevada, California & Oregon Railroad and not the Southern Pacific. The Nevada, California & Oregon Railroad has approximately 13 and a fraction miles of railroad within Lake County. (1044.) That is the total of railroad mileage within my entire county.

Other resources that demand a rail outlet at the present time
567 in addition to the timber are mineral deposits. I might make particular reference to Alkali Lake. The tonnage there I haven't—I have an estimate of 50,000 tons yearly. That is taken from statements made by the people who own the lake. That is the eastern part of Lake County. The original survey I believe would be somewhere around thirteen or fourteen miles from the Harriman survey or the proposed cross-State line.

As to other resources in the county, particularly as to possible agricultural development, there are numerous valleys possible of development, some of which are just in the making now, and with proper transportation facilities there is no reason why they should not produce a greatly increased tonnage. I would refer first possibly to the valley which this (1041) cross-State line, its original survey, passes through; that is the Fort Rock and Christmas Lake Valleys, lying east of Fort Rock a distance of approximately 40 miles, 35 to 40 miles. They would be immediately adjacent to or traversed by the route of the proposed line; the line as surveyed running through the northern part of that area.

I made a special trip into the Fort Rock Valley area last Sunday, the 5th of August, with P. T. Fortner, our county agent. The situation as I find it there at the present time with regard to development is this: About twenty years ago the valley was settled up by possibly a thousand homesteaders—possibly that is exaggerated a little, I would say 750, judging from the records of patented lands. They went in there just following the survey of this proposed cross-State line. I found that they had put up better than the usual class of improvements on these homesteads—this from past observation as well as the one I recently made. I have been through that territory before. I might add that many of the houses that were
568 constructed were sided and not of the ordinary box type of house that you find in a newly settled country that the home-

steader will put up; many of these places had large barns, and a great (1042) many of them windmills, and they were all quite well fenced, a number of places even having open wire fences around them. At the present time there are very few families residing in the area. I visited a number of those places, particularly south and east of Fort Rock, where at this time there is development under way for utilizing the underground waters by pumping. One of the first places we visited was that of Mr. John Ernst, located about seven miles southeast of Fort Rock. We found that Mr. Ernst has a ranch of 120 acres. I found that he is utilizing a well that was drilled as one of the program the State carried out a few years ago. This well was drilled 220 feet in depth. The water rises to within 25 feet of the surface. He has installed a pumping plant of sufficient capacity to irrigate the 120 acres at a cost of approximately $20 per acre. He informed me that his maintenance on the plant this year would be cut down to not exceed $1.70 per acre, possibly $1.50, due to the fact of his being able to get Diesel oil at a lower rate than he had previously. He is at this time irrigating approximately 50 acres; some 20 acres of that he had in alfalfa, planted some four years ago. He informed me that last year this alfalfa made a return of better than four tons per acre, and (1043) this year of course he is unable to determine yet what the yield will be. However, he made an early cut, and the second crop is now on and is in some places three feet in height, of which I have a bundle of it here that I cut from his field last Sunday, as well as taking a photograph of it (exhibiting same).

569 Q. Is the alfalfa fully developed at this time? Is that ready for cutting?

A. I might add that he planned on cutting this second crop for seed, but he was informed by the county agent that he let his first crop remain on the land too long; he should have cut it by the first to the tenth of June and he didn't cut it until the 20th of June.

This area I am talking about is within the so-called High Desert. (1044.)

I have some pictures which will depict the situation or manner in which the Fort Rock Valley is being farmed. Unfortunately I didn't have but two copies of these. I was not aware of what was needed when I came up here. I can provide some of them, but it will take a few days to get them. That is the Ernst ranch; that is the potato patch on the Ernst ranch; that is rye on the Ernst ranch, and this is alfalfa on the Ernst ranch.

These are the pictures I referred to. They were taken by Mr. Fortner on Sunday, the 5th day of August. They were taken on the John Ernst ranch in the Fort Rock Valley. They correctly depict the conditions that I found to exist there. (1045.)

(The three photographs so offered and received were thereupon marked "Complainant's Exhibit No. 20, Witness Nolte.")

I might comment on these by stating the one with the barn and the spud patch, the spuds were in a thrifty condition. Some in the hills

were as large as goose eggs, and there was no indication that there had been any frost to damage the tops.

Exhibit 20 consists of three pictures taken at the John Ernst ranch. I believe I have commented on the first one. It
570 shows the barn and the spud patch, showing that spuds can be grown, and they were not damaged by any possible summer frosts, as has been charged against that district. The other two are field crops, one of which is alfalfa, a sample of which was shown here this morning. The alfalfa was in fine condition, and stood from 30 to 36 inches in height. As previously stated, this was cut on the 20th of June and the crop, as indicated in the picture, matured between that time and the date the picture was taken. These crops are raised under irrigation by pumping from the well that was described in my testimony before lunch. (1046.) The other picture is a field of rye growing on the Ernst ranch, as it shows there, about 48 inches in height. That is a sample of the rye here (exhibiting same).

Another crop of great promise is the brome grass, of which I brought a sample. It is a very hardy grass and is adapted to climatic conditions, such as exist in central Oregon, and is extensively grown all through the northern part of the United States, particularly in the Dakotas, and offers great promise for both grazing possibilities as well as hay.

Another plant I observed on Mr. Ernst's ranch that offers great promise on the grazing angle is sweet clover. There is only a few plants that originate from seed in other crops he had on the place, and I didn't disturb them, but the evidence was sufficient to warrant the statement that sweet clover is adapted to that section. This sweet clover in particular is a crop that is adapted both to irrigation and non-irrigation, as it will mature in a very good forage or pasture crop as well as a possible hay crop, even without irrigation, where there is a limited rainfall such as exists in eastern Oregon.

I might comment on that by stating that on the 20th of June
571 this year our county agent, assisted by the State agent leader, Mr. Ballard, had a pasture excursion out of Lakeview and visited numerous ranches around that point, and he particularly (1047) commented on the adaptability of yellow sweet clover in particular to eastern Oregon sections, and enlarged on its possibilities as a pasture crop, both on dry and irrigated lands. This also holds considerable promise for the Fort Rock area.

As to the condition of the John Ernst ranch, it has been tested over a period of years. However, the climatic conditions this year have not been as favorable as in previous years. The spring weather was backward, as we all know, this season, all over the coast, and then followed by rather excessive warm weather. However, the crops show every indication that they could be profitably grown and yield sufficient returns to warrant the investment connected therewith in development. There are other farms of a similar nature being developed in the Fort Rock Valley. The same date we visited another

ranch being developed by H. N. Parks, who was the man that made the research work that resulted in the development of these pumping wells. We took pictures of the development. (1048.) I might just relate the conditions under which we found this development taking place. These two are pictures that were taken. They correctly depict the situation we found and so far as the manner of applying the water was concerned.

(The two photographs so offered and received were thereupon marked "Complainant's Exhibit No. 21, Witness Nolte.")

572 Describing the conditions that I found on this development, the Parks development—the one marked 21 shows a building in the background and two men standing on the headgate works close to the pump house on the H. N. Parks ranch. Mr. Parks, as you possibly know, was the man instrumental in having the research work done which discovered this seemingly unlimited supply of underground waters. This plant was just recently installed; it has only been in a few weeks. (1049.) Mr. Parks has cleared off some 50 acres of ground, plowed and cultivated it, and just recently sown alfalfa, which was coming up when this photo was taken. This particular well is 250 feet deep. The water rises to within 30 feet of the surface, with a pumping lift of 39½ feet. The cost of installation, engine, pump and well, totals $3,500. He plans to irrigate 200 acres from this well, and observation leads me, as well as County Agent Fortner, to believe that he has much more water available than is even necessary for the 200 acres. At the time we were there he was pumping and irrigating this 50 acres. The pump was throwing 1,300 gallons of water per minute, filling a ditch four feet in width by ten inches in depth. The water was flowing in corrugations through this field, taking three men and himself to handle it, and even then it was more than they could take care of. It led me to believe that he had water enough there to easily irrigate a half section from the head as compared with heads of water used in other irrigation projects which I have observed. It was a most unusual surprise to me to witness this enormous volume of water. I had heard about it, and it seems to offer tremendous possibilities in the way of development of irrigation in that district.

573 The Parks development is located (1050) about three miles south and east of the John Ernst ranch. I can give the section, township, and range locations, if you desire: Section 33, 26, 15. The Ernest well is located in section 17, 26, 15.

As to how much acreage there is of the type I have described on the Ernst and Parks ranches which may be developed in a similar manner in the Fort Rock Valley, I might state that for the purpose of comparison and forming my observations I asked the deputy county assessor to prepare a map showing the areas of different lands in that district, which he did, with the information that he himself was one of the homesteaders in that area, that he was familiar with it, and that the map as prepared shows approximately, however, not definitely, the areas of land that might be available for possible agri-

cultural development. However, not all are within the proven area of this subterranean water supply. The area extending from Fort Rock to a point 15 miles east of Christmas Lake lies in this area. The district as (1051) surveyed in the geological work by Mr. Parks does not extend that far east. Mr. Parks informed me that he estimated that there was one hundred thousand acres in the area which was proved to be underlain with the waters as developed by these four or five test wells. He said further that the district itself might extend to include more, even up to 200,000, but that had not been determined as yet. This data secured from the county assessor indicates that lands that were homesteaded and possibly were of a fair average value totals somewhere between 280,000 and 290,000 acres.

I might comment further by stating that the assessor, when he prepared this map, stated that a demonstration was conducted, pumping from surface water supply, in section 5, 27, 18; that at an
574 18-foot lift water was delivered on lands owned by Mr. Gooch, by a 6-inch centrifugal and 3-inch centrifugal, both pumping at the same time for a period of twenty-four hours and did not diminish the surface supply of water. The land referred to is the High Desert.

The Fort Rock region presumably extends to Christmas Lake. (1052.) That area would possibly comprise 170,000 acres, something that way.

In addition to the crops which may be produced under irrigation, I would say the land in the Fort Rock Valley is susceptible to development through dry farming methods to some extent. I observed this: That there are several different kinds of soil in that valley. On the Parks place, for instance, it is a clay loam sand mixture; on the Ernst ranch it is a pumice sand loam and apparently a volcanic ash, as the soil was lighter in color. Then there are other areas that vary in loam mixture, along the foothills of the Connley Hills. These other areas are just south of the Parks ranch. There is considerable vegetation growing, among which is what is known as wire grass. I noticed that for several miles through that country that this grass is only found where moisture rises to the surface, or moisture is on the surface, indicating that water is in the soil, or rises through it as a result of the porous condition because of the pumice sand content. This would lead one to believe that such crops as rye, wheat, sweet clover, and other hardy crops adapted to dry farming could be grown on land of that character.

Further to the north and east an area around Christmas Lake that I observed has various weeds, the same as we find (1053) in the Goose Lake and Summer Lake Valleys, growing, some of them, from six to eight and 10 inches in height. One particularly
575 is what is known as Russian thistle. It is a plant which is a pest in the irrigated districts as we all know, yet it is growing out in this country, showing there is considerable moisture in the soil.

Also in this area we found a great deal of this native grass known as rye grass, six feet in height in numerous places. We interviewed Mrs. Buchanan, who runs the postoffice at Lakeview, the postmistress at Lakeview. She stated that they had a rye grass pasture about a half a mile from their buildings, on which last year, the 50 acres, they got 70 tons of this class of hay, rye grass, for wintering their stock, it being suited to feeding cattle and horses.

The water in that section would support in farming a project approximately 100,000 acres, according to the research as conducted by Mr. Parks. I particularly asked him about that, and he said that it was his opinion that approximately 100,000 acres was in that area, in which there might be developed this water the same as is on his ranch.

These pictures were taken in what is termed (1054) the High Desert.

This rye grass referred to is the native wild rye grass, and it is a common expression among the pioneers of that section to make this comment: That whenever you see rye grass growing it is an indication that moisture is not of a great depth; that is, that there is more or less moisture coming up from a subterranean source, if not it is a result of rainfall.

In my judgment the construction of the cross-State line undoubtedly would result in the recolonization of this Fort Rock area and its development. As to what the lack of transportation has to do with the fact that it is not being actively farmed at
576 the present time, except to the limited extent I have described, I would say that in the particular instances of these two men whose ranches we visited, some of the problems confronted, among others were the matter of getting in their fuel oil for their pumping work—the cost of these would be materially reduced as a result of transportation. I have observed that at the present time in securing colonists or settlers for an area such as this, that one of the first questions asked is: "Well, what about transportation?" We at Lakeview, until our (1055) railroad was standardized, were particularly handicapped in that regard. One of the first questions always put up was: "Well, we can't ship anything over a narrow gauge railroad; how do you expect us to locate under such conditions as those?" The same thing applies to such communities as Fort Rock, without transportation. People when they are looking for a home invariably look for an outlet either by rail or by highway. There are highway projects now pending that will materially assist in developing this area, but not to the extent of in any way taking the place of a railroad.

The length of haul from the John Ernst ranch in the Fort Rock Valley to a railroad at the present time, say to Bend, would be between 65 and 70 miles. I believe Bend would be the nearest rail point. Approximately the same distance possibly to the line extending from Bend to Klamath Falls.

In order to reach any of those rail facilities that I have described it will be necessary to cross some mountain ranges. There is the

Walker Range, part of it; Sugar Pine Mountain lies between that country and the Great Northern or the Southern (1056) Pacific's Cascade line. The principal disadvantage, however, is the
577 fact that area in there is subject to considerable snowfall, and road conditions are bad through probably six months of the year.

I have made a study of precipitation records for our county. As to rainfall: I happened to secure some records from the engineer who put in our irrigation project at Lakeview, among which was a blueprint that was kept at the old Indian fort about 25 miles southeast of Lakeview, one of the oldest weather records anywhere in that area of northeastern California or northwestern Nevada or south central Oregon, which dates back to 1866, which seems to indicate that there was a period at that time when precipitation was considerably in excess of what is shown by present day records. The old pioneers recount that Goose Lake was dry in the fifties, about '53; that following that it filled up; and the Pacific coast records, as recorded in the Willamette Valley and elsewhere, indicate that in the early sixties there was a period of rainfall that possibly was considerably above what we have to-day. Those records substantiate that. From this, the record that was kept by this fort, for the period 1866 to '76, the precipitation was 19 inches plus; '76 to '86, 21 inches plus. Our Lakeview records start (1057) in about '85, I believe, '85 or '86, and the earliest records we have—in compiling data we always refer to the earlier days in Lakeview, in our old Commercial Club literature and such—and they show it as being 17.80 inches of rainfall. That is per year for Lake County. That would be possibly for the period '86 to 1896. From 1896 to 1906 I have some of those Government bulletins here with me, but I can give them close enough approximately; they show a precipitation of 15 inches; the
578 ten-year period following that it dropped to something like 13, and the year of 1924 our weather station at Lakeview reported 6.80 precipitation.

Now there is a period from 1866 to 1924 with a drop from an average of 21 inches to six and a fraction. So it is reasonable to presume that we are dealing with this situation at the present time under the most extreme drought conditions. It is likewise reasonable to presume that there will be a return of those cycles, under which conditions the stock industry was built up in eastern Oregon, as our old pioneers refer to the famous eighties as being such thriving, prosperous times among our stockmen, which was largely due to the fact that they were getting a reasonable amount of precipitation. (1058.)

That the cycle will turn the other way has been proven by records that have been kept in various weather stations throughout the country over a long period of years. That has been the history of all weather records. As the saying goes, there has never been an extreme but what you may expect it to be broken.

Exam. ROGERS. This rainfall that you show, is that all in one spot or is it distributed, or how?

A. Well, I would not say so. The comparative records of Lakeview—well, there was a station at Christmas Lake; they had a station there I think for three or four years. Their precipitation at Christmas Lake run something like 11 to 12 inches as compared to our precipitation at Lakeview of some 15 inches.

It is true that some of the lakes of central Oregon, especially in our section of the State, that were dry, or nearly dry a few years ago, a year or two ago, are starting to fill up again during the
579 last year. Goose Lake, for instance, is known to be dry in 1853 and it went dry again in 1924; in 1925 it began to fill up, and '26 it increased, and '27 and '28. And likewise our weather records show that in 1927 precipitation at the Lakeview weather station was fifteen and a fraction inches for the period of September to September (1059), or the crop season, and for the period from September, '27, to September, '28, this present year, it will be around 12 inches, slightly under last year. (1060.)

Q. What is the State of Oregon or your county government doing toward developing highway facilities in Lake County?

A. The State highway program now contemplates the completion of our through highway from the California line by way of Silver Lake to a connection with The Dalles-California Highway at LaPine within the next three years, under the present program, I believe. Further, there is a project on now that is being handled independently of the State highway program, during the preliminary stage, at least, known as the Yellowstone cut-off. This road contemplates the construction of a connecting link in our highway system from a point near Paisley to the Lake County line and Harney County near Wagontire Mountain. There has been an organization formed comprising some nine counties of northern California, Oregon, and Idaho. That association has raised funds, now have a paid secretary to promote the proposition. We are receiving cooperation and financial support in northern California, as well as having the San Francisco Chamber of Commerce back of the project.
580 This will, when completed as planned, develop a much shorter route between California points and the Yellowstone National Park. Approximately 70 miles of the State highway has been completed at the present time. Other sections have been graded, but not gravelled (1061)—sections in the Summer Lake area. I have included in that a few miles south of Lakeview as a part of that particular highway.

I believe the construction of the cross-State line will benefit Lake County as a whole. While we have a standard gauge railroad in to Lakeview, there are many advantages to be gained by a route connecting Lakeview on the north with this cross-State line, and particularly connecting us up with the State of Oregon. We are told repeatedly by our business men and merchants that Portland is a

much better buying market than San Francisco, and at the present time we—even under present conditions, we have a little freight rate advantage into Portland, and with the construction of this line it would be materially increased and we would have a direct rail connection, which we haven't at the present time. Rail shipments now have to go south by way of Fernley, Nevada, Roseville, California, and to Portland. However, I might add that some shipments are coming into Klamath Falls and being trucked across to Lakeview.

When I say that Portland is a better buying market I mean that the merchants there can buy to better advantage. (1062) I have heard of several specific instances where they can buy their merchandise and supplies in Portland to better advantage than they can in San Francisco.

It would undoubtedly be an advantage to be placed in more direct contact with the State Government and with the State colleges and schools.

Q. Is it your thought that the completion of the cross-State
581 line would hasten the extension of the line from Lakeview north? Is that what you had in mind in suggesting that?

A. I believe that a line from Lakeview north is—well, we know that it is absolutely necessary. When it will be built is the only question that will enter in there, because the timber tonnage is there, and the railroad is the only way it can be moved. It can not be moved out on foot.

If the line I mentioned north in connection with the cross-State line were never built, I would still say that the cross-State line would result in advantage to us in this way, that it will develop an area of country that would materially increase our assessed value in the county and will assist in the growth of the county as a whole.

I believe a line connecting the proposed cross-State line with the stub-end at Lakeview (1063) is the plan that will adequately and properly develop the county.

I have taken active part in railroad-development work in Lake County in the past. About 1916, I believe it was, Mr. Strahorn proposed a system of railroads to develop central Oregon, and from the beginning of his project I was in close touch with him. At one time—in fact, in 1916 it was—I was on a committee that assisted him in getting rights of way from Lakeview north through Lake County. His plans at that time were a line running from Bend southeasterly, and from a point near Millican a line running south to Silver Lake, with a projection to Klamath Falls, as well as through Paisley and on to Lakeview, over the route we have been discussing, the line from Millican extending on to a point near
Burns. Then later, after he began actual construction of his
582 line out of Klamath Falls, I was again cooperating with him in the matter of the location of that line, as well as procuring some rights of way for him on the Klamath-Lakeview line, which now seems to be out of the scheme altogether.

Some mention has been made in this record concerning the possibility of completing what has been known as the Modoc Northern. That is a line that the Lakeview extension connects (1064) with.

Q. Will you state in a comparative way the advantages that line, the Modoc Northern, to your community, as distinguished from the advantages of the cross-State line? State which one will serve your purposes best?

A. Well, from one angle in particular, in the matter of lumber development, it appears that our lumber industries, if developed as result of the building of the cross-State line and feeders out, would result in a direct profit and benefit to the whole of Lake County, whereas with the construction of the Modoc Northern there is a tendency to take advantage of the more beneficial freight rates in communities like Klamath Falls, and possibly even Alturas, to attract the timber from Lake County to those points. In other words, those towns being located on the main line naturally would have an advantage over Lakeview and other towns that might develop as a result of milling activities, whereas with the cross-State line being closer to eastern markets the rate should be more advantageous.

Q. Do I understand that you mean to say that the Modoc Northern would result in development in California and Nevada, whereas the cross-State line would result in the development being fostered within the State of Oregon?

A. We have cause for some apprehension on that point by reason
. of the fact that a year ago the Pickering interests, (1065) who
583 now propose a mill at Alturas, had an option on some 700 million feet of privately owned timber that lies directly east of Lakeview, indicating that there might be a possibility of their desire to haul that timber to Alturas in case they should have concluded part of their plans for that plant at Alturas.

To summarize my suggestions with regard to this railroad development, it is substantially this, that we want the railroad picture developed in such a way that it will make Lake County a part of Oregon, and not part of California.

I have examined the tonnage estimates prepared by W. L. Teutsch and introduced as Exhibit No. 1 in this record, so far as the same covers tonnage to be moved from or to Lake County. I would state that Mr. Teutsch hasn't, apparently, included therein the available timber tonnage that I have given earlier in this testimony.

Q. Mr. Teutsch's testimony was intended only to cover agricultural commodities?

A. Well, then I might add that he states here, in potential tonnage for the cross-State line from development, in his (1066) areas, he includes in the Summer Lake and Silver Lake district only those lands under the present irrigation projects. There are several thousand acres of land that are under independent water supplies, which would increase those areas some three times. Fort Rock and Christ-

mas Lake Valleys, he indicates an area of 230,000 acres, with a possible 20 per cent development, or 46,000 acres, whereas I have earlier stated that there is a possible hundred thousand acres in that area. The statement of tonnage would correspondingly be increased by these comparisons.

584 In my judgment, Mr. Teutsch, in making his estimates for Northern Lake County, in his Exhibit No. 1, was unusually conservative.

One point I might add in connection with the well on the John Ernst ranch, that is, that it was given a test of 108 hours pumping, throwing 800 gallons per minute, and in no wise diminishing the supply.

I might also add that another one of the wells drilled by the State is located on the ranch of Frank and Harry Crampton, in section 15–26–14. This well has a lift of 41 feet, using a 12-inch centrifugal pump, with a flow capacity of 220 gallons per minute, and it has been subjected to tests of 24 hours without diminishing the supply. (1067.) These men are working under similar conditions to those of John Ernst. They have several acres in alfalfa under irrigation, are running a farm flock of sheep, which industry, along with possible dairy development, holds forth great promise. In fact, Mr. Crampton stated that he was going to immediately increase his sheep, as they are not only a profitable line of effort, but particularly adapted to the conditions such as exist in that country. We also observed several other bands of sheep in that district existing under the usual range-run conditions.

As to the most likely market, or the best market for the agricultural products which are and which will be produced in Northern Lake County—I would say that, speaking of the livestock, particularly sheep, that the larger part of the lambs could easily move into Idaho, due to the fact that, as I understand, the Idaho lambs

585 are early, being lambed in February, and they are mature and out of the way, while the Lake County lambs, that is, the large percentage of them, at least, are feeder lambs, and there is demand in Idaho for these. I would say at least 50 per cent of the lamb crop of Lake County would be tributary to this cross-State line, due to the fact that they range in the northern part of the county. I have these figures from data compiled by our Chamber of Commerce recently. (1068.)

As to the market for other products: The seed crops, I believe that this area, the Fort Rock country, and Christmas Lake County, particularly, under irrigation would develop into a seed country, alfalfa and clover seed, probably peas. Those crops find an outlet largely in the south and east. The possibility of raising certified seed potatoes is also a hopeful one. The fact that it is a new country and there are no diseases in there makes it particularly adapted to that. Probably a large part of those would move to California, as there is now a demand in California for northern grown seed potatoes.

Mr. McCULLOCH. With the further drilling of wells in northern Lake County, and the construction of the proposed cross-State line, what, in your judgment, would be within the realm of reasonable possibility and probability in the way of an expansion and extension of the livestock and sheep-growing industry of northern Lake County?

A. Well, on the basis of some comparisons I made with conditions around Lakeview, I compiled some figures that are almost unbelievable. I might be peltered if I stated them. In that con-
586 nection I might enlarge upon what I stated a moment ago, regarding the passenger excursion that was held out of Lakeview on the 20th of June by our county agent and (1069) State agent leader, Mr. Ballard.

In the last three or four years, in the territory adjacent to Lakeview, there has been some most fine developments in the way of pasture crops, conditions that, as Mr. Ballard stated, are proving eastern Oregon at this time to be a country that is going to develop to compare with the Tillamook country in dairying, for this reason, we raise an excellent quality of alfalfa hay which is suited for use in feeding of dairy cows during the winter months. Further, that during the summer months, at this particular season, as observation tells you, all the pastures in the Willamette Valley are dried, cows have no green feed.

The territory around Lakeview—one particular place that he visited was Mr. Bradley's, three miles west of Lakeview. He sowed seven and one-half acres of yellow sweet clover. In addition to that he has four and one-half acres of mixed pasture grass, making a total of 12 acres. On this 12 acres of ground he was pasturing 62 ewes and their lambs, 13 milk cows and seven horses, and they had plenty of feed. Now that was the 20th of June, and the pasture is in the same condition to-day.

On the C. W. Ogle ranch, located four miles west of Lakeview, and two miles north, Mr. Ogle had a field of eight acres in Alsike clover, orchard grass, red-top grass, mixed. This (1070) pasture was irrigated. In a field, not adjoining, but about 20 rods distance from the ones irrigated, he had eight acres of non-irrigated
587 yellow sweet clover. This was a field some three years old. In these two fields of eight acres each there were 27 head of grown stock—I believe 20 cows and seven head of horses. The Alsike clover was knee-high in places over this pasture, the stock not being able to begin to feed it down. The same condition existed in the yellow sweet clover patch, and I put this question to Mr. Ballard: "There's 27 head of stock in this field. What would you say this pasture would carry, the sixteen acres?" He said, "Easily fifty-four head."

We visited another place, on the Smith Brothers' ranch. Smith Brothers had five acres of mixed pasture grasses under irrigation. They had 14 head of milk cows in the five acres, and there was plenty

of feed. There was grass in patches all over that pasture from six to eight inches high, green clover for pasture, Lodino clover and other mixed grasses.

Another ranch we visited was that of George Stockburn. He had 11½ acres in Lodino clover, bromegrass, Italian blue grass, and tall meadow oats. In addition to this was about three acres of hillside blue grass. In this field there were 70 ewes and their lambs, and five dairy cattle. (1071.)

With the drilling of additional wells in northern Lake County, and with water from these wells available for the irrigation of such tracts of clover, alfalfa, and hay of different kinds as I have just described on these ranches around Lakeview, it is my judgment, from my knowledge of conditions in the county, that a similar production that would support sheep, cows, lambs, and such, could be maintained in northern Lake County, as those I have just described around Lakeview, for the reason that samples of alfalfa that I have here, as well as this bromegrass, and also the few stray
588 plants of sweet clover I saw growing on John Ernst's ranch, indicates to me that the conditions are very similar.

In my judgment with the drilling of additional wells in northern Lake County, and the construction of this cross-State line, there is opportunity for an extensive enlargement and development of the livestock and feed growing industry, and coupled with that is the fact that by raising feed and such pasture grass as necessary for the farm flocks it would be greatly augmented by the stock that can range in the open country by reason of having feed available for the winter. I believe that such development would come with the construction of this cross-State railroad. (1072.)

Q. (By Mr. DUNCAN.) Mr. Nolte, in your direct examination you made some reference to the Strahorn railroads that were initiated in 1916, I believe. As I understand the Strahorn plan, it was a plan by which he hoped to connect up the dead ends of lines that terminated at Crane, Lakeview, Klamath Falls and Bend, through the construction of a railroad practically identical with the line that we are petitioning for; is that correct.

A. Practically so. He only started construction at one point, Klamath Falls. He extended approximately 40 miles to Sprague River. That line was later jointly acquired by the Great Northern and Southern Pacific. That line is now being extended to a point at Bly, Oregon, in Klamath County.

Q. Now, is the rest of the Strahorn program being continued or not? (1073.) Is he still working upon that plan that he formerly had?

A. There is no assurance that such is the case. As I
589 understand, in the decision permitting the purchase by the Southern Pacific and Great Northern of this Sprague River line the conditions were such that it should not be extended beyond the Goose Lake or the Chewaucan water sheds, that that territory

should not be molested, but be reserved for the development by the N.-C.-O. Railroad. However, at this time there is an unfavorable move on. I understand the Iwauna Box Company, of Klamath Falls, is negotiating for the purchase of the Booth tract, which lies partly in the Goose Lake Basin, and they might very easily extend from Bly over into the Goose Lake Basin and tap the timber from that point. It would be with a logging line. It would be very detrimental to the best interests of Lake County. I understand Mr. Strahorn as possible developer of that territory has passed out of the picture. We can look for no relief from a completion of the original Strahorn plan. (1074.) The Strahorn plan did not exactly contemplate this line from Crane over to Crexcent Lake. His project started at Bend, one line running from Bend southeasterly through Millican to Crane. At a point near Millican the line turned south, Silver Lake being the junction, one branch going to Lakeview and the other to Klamath Falls.

Q. That, however, all traversed east and west this high desert that has been mentioned?

A. Practically the same thing, any more than passing a little farther to the north than the original Union Pacific cross-State survey.

590 Cross-examination:

Q. (By Mr. Spencer.) Where are those national forest administered, the Fremont National Forest, that includes two-fifths of the available timber in Lake County? At Lakeview or here?

A. Well, there is a resident supervisor, and the general office is located here in Portland, I understand.

Q. Now, adjoining them on the west and south, is that the tract that you refer to that the Iwauna Box people are (1075) purchasing from Booth?

A. That would be in the Quartz Mountain area. The Booth tract is outside of the forest largely. A little of it is inside of the forest. It joins the forest. It seems to indicate that it is headed for Klamath Falls. If that is cut and harvested it isn't likely the probable harvesting of the Government timber would follow in the same way, for the reason that the Government's plan of operation is for 50-year working cycle, and it isn't likely that a concern of that class would want to prolong their operations in that area for that length of time. Nevertheless, the loss of that tract of timber would be of some consequence so far as benefits to Lake County that might accrue otherwise.

As to what the Government policy is about selling that timber, or whether there is any prospective buyer, or when it might be ready to market, I do know this, that they have made cruises of several tracts upon the hope or promise of prespective operators. For instance, the Warner unit, east of Lakeview, was cruised (1076) several years ago under the request of a prospective operator, and

then conditions didn't come about that were anticipated, namely, the standardization of the N.-C.-O., so the unit wasn't offered
591 for sale. The standardization of the N.-C.-O. has been in progress about a year and a half or two years. It was completed here last May. No additional mills have gone into Lakeview. The elevation in Goose Lake Valley and Lakeview there is 4,700 to 4,800, through the valley. It is somewhat in a basin, protected even to the extent that it raises fruits like apricots, and I even ate ripe peaches the last day of July in Goose Lake Valley, grown in the valley. I don't claim any such condition as that obtains up there in the Fort Rock Valley, but the Fort Rock Valley is some 500 feet lower (1077) than the Goose Lake Valley. As to it suffering more from frost than any location in central Oregon, I must answer this by saying that this particular potato patch as illustrated in the exhibit as being on the John Ernst ranch doesn't show any indication of frost. Yesterday coming into the Klamath Basin from Lakeview to take the train for Portland last night I noticed numerous potato patches that had the tops of the vines burned down for two inches by frost. That was in the country between Olene and Dairy and Bonanza, in the Klamath Basin, at an elevation of some 4,000 feet. So in the matter of making comparisons I don't believe that that situation or illustration you were making there would hardly apply, because sometimes there are other conditions that enter into it, and the fact of the Fort Rock Valley being some 500 feet lower than the Goose Lake Valley, possibly that would tend to ward off or retard frost.

As to Fort Rock Valley having the reputation of being afflicted with killing frosts more than any valley in the central Oregon country, I would say that that was an erroneous term applied to it, as far as that goes. That might be due to a large extent to
592 the fact that it is undeveloped, as it has been proven in (1078) districts that have been developed, the removal of the sagebrush, the killing of the soil, your soil is warmer, it retains the heat of the sun in the daytime and it will stand a colder temperature at night.

Q. You mentioned the barriers that you encounter in going west from Fort Rock, or your counsel inquired of natural barriers that were encountered. Is that the condition there?

A. Well, my statement was this, it wasn't so much the barrier of altitude as it was one of climatic conditions which rendered it impassable in the winter, as due to excessive precipitation in that area, because there are no excessive grades between the Fort Rock country and that area you refer to.

Exam. ROGERS. Somebody said the other day the plumbing froze up at Odell Lake.

Mr. SPENCER. I noticed an article in the paper—I don't know whether Mr. Dey did or not— that the lake up there at Crescent Lake actually froze over here three or four nights ago.

A. Well, that is true. I can report to you that around Lakeview out in the forest areas, there was an ice formed last month, and yet that doesn't mean that it formed down in the valley. There would be a difference of elevations that would apply to the lake that Mr. Rogers spoke about, conditions up in the mountains possibly 1,500 feet higher than the Fort Rock Valley. Conditions in that area are very peculiar in that (1079) regard. Take it in the high elevations you will find frost, down in the valleys you won't.

Q. I am reading from Exhibit 16, prepared by Mr. Newell, page 143: "I have selected a point on the Oregon Trunk 41 miles
593 south of Bend"—I suppose that means the Great Northern; the Oregon Trunk doesn't extend south of Bend—"which I have called Walker Junction, and which would be connected with Crescent Lake station by a water grade line about 26 miles long following Crescent Lake. Its construction would present no unusual difficulties." Now, the construction is less difficult east of that junction than it is west of it, isn't it?

A. If you will refer to my statement, Mr. Spencer, you will see that I said that the particular barrier was the amount of precipitation in that area and not the elevation or grades encountered. I am perfectly familiar with that country, and I am aware that there are no grades through there. It is a very easy country to get through. But I have been through there in the winter time in an automobile, where you have water and mud two feet and a half deep, and you are breaking your chains every little distance.

You can go practically in a direct line from Fort Rock to the Great Northern Railway, but it isn't reasonable or practicable to presume that (1080) any farmer in this day and age of the world is going to be expected to drive 40 or 50 or 60 miles to a point to carry on his trade relations with the outside world.

Q. Well, 40 miles isn't so far for a stock operation, is it?

A. Yes; but we are not presuming that the development in this Fort Rock area is going to be confined to stock that you drive out on the hoof.

Q. Well, there isn't any substantial livestock operation in the Fort Rock Valley, is there?

A. I might state that Mr. Ernst has as fine a herd of Holstein cattle as I have seen anywhere in central Oregon, building
594 up a very fine herd of milk cows. He had between 200 and 300 head of very fine leghorn chickens and they were laying hens, too. Now, butterfat, and eggs, and things of that kind, productions of that kind, it isn't practical to haul them that distance. Along with the fact, too, that his incoming produce naturally would have to be carted over the same distance, and he would be at the extreme west side of that district. Those living further east would have 50 or 60 miles that they would be expected to travel to market.

Q. Well, it is about 25 miles from Fort Rock, 24 or 25 miles, to the Great Northern line, isn't it?

A. It is? Well, I didn't know the exact distance. I think I said this morning 40 miles. Twenty-five to Fort Rock, and, say, 7 to Ernsts, is 32 miles. (1081.)

Beef cattle and sheep can not be raised in there in large quantities for the very reason that there is a tendency on the part of prospective settlers now to desire to locate where there are transportation facilities and all the other modern conveniences that go with modern railroads, and for that reason it isn't likely that they could be induced to settle out in there 40 or 50 miles from a railroad. We have that illustration very clearly demonstrated in the Goose Lake Valley. Our best ranchers are located within 3 to 10 miles of town, and you go out 20, 25 miles, where you have got soil, water, and climatic conditions equally as favorable and you don't find the successful farmer that you do around closer to town. Now, he evidently appreciates or realizes that condition as his reason for locating there.

595 I have understood that the John Day Valley and in the areas east of Prineville, on up into the Bear Valley, along that ridge and in those valleys between Seneca and Prineville, and in the John Day country and in the Antelope country, the Crooked River district, was considered a good cattle country.

Q. Yes; and they drive 70 to 100 miles? (1082.)

A. The conditions are different to this extent—that area, while I haven't been over all of it I have been over part of that particular part of Oregon—the country there is rolling hills, largely, rolling grass country, you might say; it isn't a soil, outside of a few places, possibly, where they are raising wheat, that could at all be compared with this Fort Rock country. Soil conditions in the Fort Rock Valley are very similar to those that are found in the irrigated sections of Idaho. You have got your volcanic ash, and you have got your pumice, and you have got your loam soils, whereas my observation in the country you refer to is that it is a heavier type of soil and not adapted under any conditions or circumstance to agricultural pursuits, such as tilling the soil, excepting a few of the little valleys, so it appears to me to be a different condition.

I have never spent a great deal of time in the Fort Rock Valley. I visit that valley probably two or three or four times a year. In earlier days they attempted to grow wheat in there. I have seen some as fine Bluestem wheat as grown anywhere grown out in that Fort Rock country. I recall when I first came to Lakeview of a man named Remington presenting an exhibit at the county fair, Bluestem wheat that was as good as grown anywhere in nonirrigated country. The reason they are not growing it there at the

596 present time is (1038) that the people moved out when their hopes were blasted as a result of the failure of the cross-State line to build, coupled with the extreme drought that followed in the last eight or 10 years. The Christmas Lake is practically all dried up. There is a little water in it now, but it is coming back again.

Q. Well, you say these cabins were built in connection with the cross-State line. Weren't there more of those cabins built when the Great Northern and the Northern Pacific went with the Oregon Trunk into Bend than any other time? That was the time of the settlement and——

A. No; I think not. Your survey was made in 1906 or '07, wasn't it?

Q. 1907.

A. 1907?

Q. Yes.

Exam. ROGERS. When was this Great Northern built?

Mr. SPENCER. 1911 the line was opened for operation into (1084) Bend by the northern lines and by the Oregon-Washington Railroad and Navigation Company.

On our trip through the valley we stopped to eat our lunch at one of these deserted cabins, and I took some pictures of several of them around. In this particular locality there were four places that the buildings were quite close together. The one where we ate our lunch, after we were through eating we prowled around through this deserted house, and we observed on book shelves in one of the buildings a pile of school books, and I opened a book and read in there the name of the student, "Ora Wagner, Fort Rock, Oregon, December, 1908," so that would prove that those people, at least, were there prior to this extension of the Great Northern in 1911.

597 Q. I am not saying that there didn't any of them go in there, or suggesting that, but I didn't know but you might know the fact or recall that when the railroads went into Bend they extensively advertised this Fort Rock Valley and the country around Bend there in an endeavor to get settlers in there, and they did get them in there, and the dry farming failed.

A. No; I think it was before that, because I know of a few cases—now, here is one in particular: Mrs. Harry Crampton, I understand, was at one time a stenographer in the Union Pacific Railroad, and she acted on a tip and went out and took a homestead. That is what I was told Sunday when we were up (1085) there.

There wasn't any secrecy about that cross-State line, of the survey, or the construction into Bend, that I know of.

Q. The only criticism that could be made was the fact that the railroads urged settlement of this land they had entered with their rails?

A. Well, I don't believe that anyone would be justified in criticizing the railroads for not building by reason of the fact of their having gone out and taken a homestead, Mr. Spencer, that wasn't the point I was getting at, because they were just gambling with the possible chance that the road might be built.

Q. And referring further to that Fort Rock country, which you say is 30 or 40 miles from a railroad now, that distance isn't comparable with the distances here some years ago when they used to haul into the Columbia River 40 miles by team, is it (1086) 50 miles?

A. No; but you have got to meet the competition of others who are living in more favorable circumstances, and when you
598 do, why, they naturally expect similar conditions to work under. I wouldn't say there isn't any trucking in at all from any direction from this Fort Rock country.

Q. Now, are you ready to compare this valley with the Goose Lake Valley, as far as agricultural possibilities are concerned?

A. Well, I wouldn't say so as a whole, but on the comparison that I made relative to alfalfa and pasture grasses I would. I feel that hardy ever-bearing fruits, such as strawberries, possibly ever-bearing raspberries, and plants of that kind can be grown in that valley, but I wouldn't say out in the valley that you could raise peaches, although there are sections around the foot of the Connley hills that you might.

Four billion feet of timber in Lake County is the figure usually quoted and been compiled by data that the chamber of commerce has used in various instances. (1087.) That is presumed to be pine timber.

Q. Now, here is a map, Exhibit No. 17, that Mr. Newell has prepared. Those stars are supposed to represent timber, each star 50 million feet. Looking at Lake County does that appear to be about right as to where the timber is located in that county?

A. I should judge so. That timber in Lake County which is reasonably near the cross-State line is located in the north end of the county.

The line drawn west from Fort Rock and north is in the Deschutes forest. I understand there is a logging road now out in that area. Quite likely that will be milled up at Bend. It is less than 65 miles away. (1088.)

599 Q. Yes; 55 miles from this junction of the proposed cross-State line with the Great Northern up to Bend. Now, the rest of the timber in the western edge of the county is as near the Cascade line, or Natron cut-off, as it is to Silver Lake, isn't it?

A. No; I wouldn't say so. It is closer to Silver Lake.

Q. Is this Silver Lake down here? What lake is that?

A. That is Summer Lake. Here is Silver Lake. Here is the town of Silver Lake here. The bulk of it is near to the Natron cut-off, but just as stated previously, the policy of the forest service is that this timber will be milled in Lake County, where it is grown, where it should be milled, and the chamber of commerce is going to back that up and see that it is so milled.

Q. Is your chamber of commerce going to challenge the policy of the U. S. Forestry Service about these things?

A. The policy of the U. S. Forestry Service has already been announced.

Q. In other words, it is their policy to mill it in the county, regardless of natural milling sites?

A. Not when there are milling sites available right within that area where the timber lies. We have got a much more favorable

milling condition at Silver Lake than you have got (1089) at Klamath Falls. You have got a dry pine country there. You are not bothered with the damp condition that prevails around the lakes at Klamath. They tell me that their lumber "blues" at Klamath, and that couldn't possibly be the condition at Silver Lake. (1090.)

Q. Well, when you point to Silver Lake, you point to that district that has snow and the mud, and so forth, in the winter, don't you?

600 A. I didn't mention that. I was mentioning the timber west of Sugar Pine Mountain to Fort Rock. Silver Lake lies in the open. There is no timber within probably three or four miles of Silver Lake. Silver Lake lies in an open flat with a half moon of timber surrounding it.

Q. Well, the timber is not nearly as dense around Silver Lake is it, as it is in the southern part of Lake County?

A. We found, in making our check of the timber west of Silver Lake numerous forties that run a million feet to the 40 acres. Some of the heaviest timber in Lake County is right north and west of Silver Lake.

Q. Well, in any event, you agree that this map about correctly shows the location of the timber that you have been talking about?

A. Well, I don't as to number of thousands or millions of feet that you have indicated here, if that is what you desire to check.

Q. I am saying to you that Mr. Newell's testimony is that each star represents 50,000,000 feet.

A. I would like to ask you where Mr. Newell gets this cruise?

Q. I don't know.

A. Then I would not like to accept and say that is the (1091) condition of that map. It is quite likely that some of this timber in northwestern Lake County is going to be milled at Bend. But not any of that that I included in my statement this morning, or some two billion feet tributary to Silver Lake. As you recall, I said that area north of Fort Rock is not included in my estimate.

It would be a haul of about 110 miles for a logging railroad from Silver Lake down to Lakeview.

601 We expect milling operations to be put in on Goose Lake if we can secure a satisfactory rate to permit that development, but we are greatly handicapped at the present time in respect to the rates. Klamath Falls is 200 miles farther from Chicago than we are, and I understand under the rate adjustment now to go into effect September 9th we are to secure the same rate to Chicago that Klamath has, Klamath having a 200-mile longer haul; that our rate on box lumber into San Francisco is something like 5 cents a hundred, or will be under the new tariff, over Klamath Falls, with only an 80-mile longer haul. Coupled with that is the fact that our incoming freight pays a tariff of something like 70 or 80 per cent (1092) higher; that is, I mean on camp supplies, sawmill machinery, and so forth, into Lakeview as compared to Klamath Falls. That rate, therefore, would have a tendency to invite development in the

area say at Klamath Falls or Alturas as against Lakeview, because of the rate handicap.

Klamath Falls is on the main line north and south, and we are out at Lakeview, at the extreme end of a branch line, and a long branch line, which until a few months ago was even a narrow gauge, but we are 200 miles closer to Chicago. Assuming we get a better rate adjustment later on we hope to have some milling operations to be carried on at Goose Lake. It should be quite a logical place for the milling of the timber of Lake County. That is the logical place to mill for all of it that lies east of the divide between Klamath and Lake Counties.

As to pulling any of that timber that lies west of the divide north and west of Lakeview over the hill into the Sycan—
602 it is conceded that the part of the Lake County timber in the Sycan will probably go into (1093) the Klamath area. But you noticed this morning when I gave these figures I did not include the Goose Lake and Warner units, some five billion feet, the Warner unit some billion and a half, excepting to say it might work in with part of the Paisley unit. It will some time be necessary, whether this cross-State line extends south into that Paisley area or whether the Southern Pacific extends north from Lakeview, to have a line into those districts. That is why I suggested the possibility of that working in with the plan, that the connection might be made from Lakeview north to the cross-State line.

Exam. ROGERS. Will it be necessary for the Southern Pacific to build into the timbered area, or would the timber move over to the Southern Pacific?

A. It is quite likely that the plan would be, if such were considered, that the Southern Pacific would have to build north, because the distance would be too great, and coupled with the fact there is other tonnage that would not figure with the timber; in other words, around Paisley in the valley there is some 80 thousand acres of land, and the Chewaucan Cattle Company alone has something over 200,000 acres under irrigation, susceptible to a very high state of development once it is subdivided and put under smaller ownership.

Q. (By Mr. DEY.) How much timber is there within 12 miles of Silver Lake?

Comr. MCMANAMY. In the interest of accuracy ought we not
(1094) also to take into consideration the fact that in Mr. Newell's testimony he said those stars represented some 60 billion less
603 timber than there is in the State; that that which is starred did not represent completely the timbered area of the State?

Mr. DEY. Well, he said it represented the timbered area wherever he put stars, as I understand it. There may be some timbered area where no stars appear, like in this district, and this district (indicating on exhibit), but wherever he attempted to show the timber he showed it all.

WITNESS. Did you ask me the question about the timber 12 miles from Silver Lake?

Mr. DEY. Yes; within a radius of 12 miles of Silver Lake.

A. I find that Silver Lake is about 14 miles from the west county line, and that Silver Lake unit extends about 14 or 15 miles south of Silver Lake; so taking into consideration that the Silver Lake unit has some two billion feet of pine, and also the fact that it has been proven that the cruises are underestimates of the actual timber there, likewise that the forest cruise was made some six or eight years ago, we could safely say that the cruise would be possibly 20 per cent in excess of what I have quoted. Therefore within 12 miles under those conditions and comparisons there are probably (1095) close to two billion feet of timber. That will run an operation, Mr. Dey, as I figured this morning, 200 carloads a year for 50 years, figuring 20,000 feet to the car, weighing 2,800 pounds to the thousand, or a 56,000-pound car.

Q. Then you figured on a production of lumber for this cross-State line of 2,000 cars a year?

A. It is quite reasonable to presume that following that development some of that Summer Lake timber would come in there. It is just a question of what development follows. If your line
604 should extend north, naturally it would divide it the other way. If the Union Pacific built the cross-State line or tapped the Silver Lake area they might even go down and tap part of the timber around Paisley.

Q. You don't look for more than 2,000 cars a year for the cross-State line from this district?

A. Well, that is not all the timber, not all the tonnage available to that line. On the basis that I compute that is this: That on a two billion count, on a 50-year cut—and I understand that is the working cycle of the Forest Service, under which they are going to operate their timber, and they own three-fifths (1096) of the timber in that particular district—it is reversed as compared to the other districts in the county—that there would be a 40 million yearly cut. Well, 40 millions at 20,000 to the car is 2,000 carloads of lumber.

I presume they possibly move 8,000 cars out of Bend each year. Out of Klamath Falls 10,000 to 12,000. I just forecast that from comments I have heard and news reports.

Q. Now you say that you want a connection with Portland, and you have cited here the distance that you now have to go to Portland, but you say nothing about the Alturas line which will soon afford you a line to Portland of fair directness, will it not?

A. Well, if it is built. We understood that an announcement was made and they started some men to work, and then they were pulled off. That was the last report we had here a few days ago. Of course there is no authenticity, possibly, to that. (1097.)

Q. Living right there in that community and being so anxious to get to Portland, you come here and testify that your
605 best information now is that the work on that line is not progressing?

A. No; I didn't attempt to say that, Mr. Dey. I wasn't attempting to discount your statement at all; I just simply said there were current reports that construction wasn't going ahead; not meaning that they didn't intend to go ahead. I didn't know the contracts are already let on part of it and the work is going ahead between Klamath Falls and Alturas.

Q. When it is built, and it is expected to be completed in May, what kind of route will it give you into Portland?

A. Well, it will give us a distance of about 420 odd miles as compared to 460 odd miles to San Francisco—420 odd miles, I believe it is, to Portland.

Q. As compared with your present railroad mileage to Portland, what will the mileage be by rail when the Alturas line is finished from Lakeview, the county seat of your county?

A. I don't recall what the distance is between Lakeview and Portland via Roseville—1,100 miles? Possibly you can tell me. I did not give it a while back. (1098.) I think it is 53 miles from Lakeview to Alturas. Then it is 100 miles to Klamath Falls.

Q. And then a direct line from Klamath Falls in here to Portland?

A. Rather indirect at that, though. We have the combination train 50 miles to Alturas to get onto it. Outside of the 53 miles that is required to get down to Alturas we have a very good route into Portland.

To come to this hearing yesterday I drove to Klamath Falls, took the train out of there at 10.30 last night. I was here this morning.

The Ernst ranch and the Parks ranch are the only two ranches in this Fort Rock country (1099) that are being developed,
606 except the Crampton ranch—let's see; Ernst, Crampton, Parks, and Sprague. There are four wells drilled by the State, and the four ranches are occupied. We didn't visit the Sprague well. That lies south and west of Fort Rock.

Q. And on the Ernst ranch there are 20 acres under cultivation, and on the Parks ranch 50; is that right?

A. No; the 20 acres on the Ernst ranch is in alfalfa. There is something over 50 acres in cultivation on the Ernst ranch.

I am familiar with the territory along the so-called Natron cutoff, from Kirk and all north. I have been over that road by automobile several times.

Exam. ROGERS. I was just wondering what that country affords in the way of traffic as compared to what you expect to offer this cross-State line. What I am talking about now is traffic originating on the line.

A. Right directly on the line, after a few miles north of Kirk it goes through a jack pine-pumice country. There is timber, though, off to the west of it. Along the immediate location of the line, there is not much timber directly tributary to that line. (1100.)

Exam. ROGERS. I wasn't confining it especially to timber; all commodities that originate, or that there is probability of originating on that line, as compared to the cross-State line.

A. Well, I am unable to state, not knowing the timber available to that line, but it is 90 per cent timber, I would say.

Redirect examination:

I drove from Lakeview over to Klamath Falls pretty close to 120 miles the way the stage line runs in coming up here. Lakeview is about 70 miles on an air line practically due east of Klamath Falls.

607 To get to Portland the all-rail route would be Lakeview to Wendel, Fernley, Roseville, Portland. At the present time you have to go clear down through Fernley and Roseville into California and then north to Portland by existing rail connection. (1101.)

Q. Now if you had from Lakeview the connection that you advocated of an extension of the N. C. O. to the cross-State line, that would put Lakeview with respect to Portland pretty nearly the same distance as Klamath Falls from Portland, wouldn't it?

A. Practically; possibly 25 miles further. That is, presuming that it went in to a point near Odell.

The building of the Alturas line will leave Lakeview 151 miles more distant from Portland than Klamath Falls.

Q. 100 miles from Klamath to Alturas and 51 from Lakeview to Alturas. Now, with the extension of, or the building of a cross-State line and with the construction of such logging roads as might reasonably be anticipated when the time comes for the milling of the timber in Lake County, is it your judgment that a large part of the timber resources of Lake County would find their rail outlet to eastern markets via the proposed cross-State line?

A. I don't see any reason why it should not. Compared on a mileage basis they should have an advantage in freight rates. (1102.) I believe it would. I believe if this cross-State line were built there would be an assured tonnage of forest products for at least 50 years, of at least 2,000 cars a year. That is the minimum estimate I make. It would exceed that minimum estimate, in my judgment, by extending south in the direction of Lakeview. That was from Lake County. That is the combination that I used, consolidation of the private timber with the forest timber in that Silver Lake unit.

When I say tonnage would be available to a cross-State line I

608 I mean only from that particular area at Silver Lake. Yes, only from Lake County. That is true from all of the timber resources of Lake County; and also it could easily take some of that timber that lies in the Deschutes Forest, the line of which runs north (1103) of Fort Rock. It would not take the construction of a very long logging line to tap that down to the cross-State line, because the line would pass through the timbered area west of Fort Rock, in the Fremont country.

Q. Now you mentioned the conditions being favorable around Silver Lake for milling this pine lumber. You said they were much more favorable than around Klamath Falls, where the excess of moisture caused the lumber to blue. What did you mean by that?

A. I mean simply this: That in piling green lumber, if they don't use the dry kiln method, that ofttimes the lumber will discolor before it is thoroughly dried. That is true of green pine lumber. On the Silver Lake area in particular it is in the open there, where they have a great many winds blowing from the south and it dries naturally. The conditions are exceptionally favorable around Silver Lake for air drying green pine lumber.

Recross examination:

I am assuming that this (1104) pine lumber from the Fremont National Forest will go to the cross-State line. But if the Southern Pacific should build up there it might not go to the cross-State line.

Q. Now do you think that if the Union Pacific should be ordered to build this cross-State line and build it with a view of getting that Fremont timber, that it would be very long before the Southern Pacific would head up in there with an extension of the Lakeview line, to hold that timber to its rails?

609 Exam. ROGERS. It would not head up there without a certificate, would it?

A. Probably they would be inclined to do it, but I believe that thing could be worked out between the two roads. It should be. I don't think that your road should be required to build that line unless that thing is adjusted, and I believe that is a part of this case, as I understand it.

Q. (By Mr. SPENCER.) Yes; now the examiner asked you what traffic originated north of Kirk and up to Oakridge there in the gap along that Southern Pacific line. Assuming that no traffic originates along there, the building of that gap tied up a railroad from either end that serves and has on its line the largest forest areas in the country, and practically all of the large producing mills in western Oregon; isn't that (1105) true?

A. Yes; but I would also add that if your line was 200 miles shorter you might likewise expect tonnage to compensate you for that construction.

Q. Now if you had been confronted with a condition for years where the timber, say, came right through your gateway, like Portland here off the Tillamook branch, and goes on by, you don't get any of it, do you think you would stand very much show of the diversion of the timber from the forest areas served by the Cascade line?

A. Well, I don't believe, Mr. Spencer, that the Interstate Commerce Commission would ask you to build that line unless they made adequate provision to take care of that particular situation.

I don't know the exact amount the Southern Pacific has spent in there, but a considerable sum.

610 Mr. DEY. Twenty million on that gap.

Exam. ROGERS. Do I understand you to say, Mr. Spencer, or rather put the presumption to the witness that there was no traffic originated on that line?

Mr. SPENCER. Between Oakridge and Kirk?

Exam. ROGERS. Yes.

Mr. SPENCER. I don't know what the fact is as to that. I am not familiar with that line and haven't been over it. (1106.)

Exam. ROGERS. The point I was getting at, I was just wondering whether that is true; whether it was possible to justify the construction of mileage at that expense without any traffic on the line, simply to bridge traffic. That would follow from your assumption, wouldn't it?

Mr. SPENCER. I think that the operation of the Southern Pacific would justify the construction of the line to date, because, as I understand it, practically all the heavy traffic goes over that line and is diverted from the old line.

Exam. ROGERS. I am not questioning that. The thought occurred to me that if all the presumptions were true, then it would be possible to justify the construction of mileage like that, at that cost, without any traffic originating on that portion of the line.

Mr. SPENCER. Well, if you have enough traffic at each end of the bridge, why, of course you can justfy the construction of a bridge; but the condition as we conceive it is that we will land on an abutment in a snow bank on the Cascade Mountains, if we are ordered to build that line. (1107.)

611 ROBERT M. DUNCAN was thereupon produced as a witness on behalf of complainants, and, having been duly sworn, testified as follows:

Direct examination:

I live at Burns, Oregon, in Harney County. I have lived in Harney County since 1919. I have spent practically my entire life in Oregon, having moved to Oregon as a small boy in 1887. My active life, however, has been spent in eastern Oregon. I moved to Ontario, or, rather, to Malheur County, in 1907 and have resided in eastern Oregon continuously since that time, with the exception of two years. I am a lawyer. I am familiar with the conditions generally throughout eastern Oregon, and particularly in Harney County, with respect to transportation development, agricultural conditions, conditions affecting production, and in a general way, with the problems of marketing the products of those communities. I have made a very careful study and have made close observation of these problems and conditions for a (1108) period of more than 20 years. I have given particular study and attention to the project of this cross-State line, connecting Crane with Crescent Lake on the west. I was a witness in the former case in which the Public Service Commission of Oregon presented to the Interstate Commerce Commission a case in which they asked for the construction

of this line. I attended the entire hearing. I was a witness in that proceeding.

I have information respecting conditions generally in Harney County as they will be affected by the construction of this proposed cross-State line. I have made such a study and I desire to make that as a statement to the commission.

I appear here as attorney for Malheur, Harney, and Grant Counties as interveners in this case; also several of the commercial interests of that county. In addition to that I am in the employ and represent particularly the Eastern Oregon Livestock Company and the William Hanley Company two of (1109) the largest land owners in the State of Oregon. In giving my testimony here I am authorized to speak for those three counties and for the other interests that I have mentioned; the Ontario Commercial Club and the Burns Chamber of Commerce. However, in that respect I wish to say that I am not appearing as a witness on behalf of anyone except the interests from Harney County that have intervened in this case and the citizens generally of that county. I would like to state further that the reason for my appearance as a witness in this case is probably due to the fact that our county has never employed, or at least does not now employ a county agent, nor is there anyone in the county who has kept records or more accurate check upon the progress of the development of the county than myself. That has been largely a part of my work in Harney County as a lawyer.

Q. Now I wish you would go ahead and give such information as you have respecting the area, population and topograph of Harney County.

A. If I may, I would like to enlarge that question just a little bit, making the statement that Malheur, Harney, and Grant Counties, the three counties combined, have for administrative purposes in the State of Oregon heretofore been considered as one district, and it comprises the Ninth Judicial District of the State of Oregon, and the total area of those three counties (1110) is more than one-fourth the total area of the State of Oregon. That fact is not generally appreciated within the State, and I feel that I am justified in making the statement, so that the commission may understand that
613 this is a very large area that we are speaking of. As to Harney County alone, it has a total area in square miles of 9,620. That is a little in excess of one-tenth of the area of the State alone. That is in excess of six million acres, 6,357,120 acres being the generally accepted figures, and the figures of the General Land Office.

Harney is the largest county in the area in the State of Oregon, and one of the least populated counties of the State, by far the least populated comparatively as to size. Harney County is larger than the combined area of the States of Rhode Island, which has 1,250 square miles, Delaware with 2,050 square miles and Connecticut with 4,990 square miles, plus the District of Columbia with 70 square miles. It is also (1111) larger than the States of Massachusetts, New Hampshire, and New Jersey or Vermont.

Now the population of Harney County in 1920 was 3,992, according to Government census, which was less than the population in 1910, which was 4,059, showing a decrease. Our population in Harney County represents but one half of one per cent of the population of the State, as shown by the 1920 census, and is now even a smaller ratio of that population.

The population of the State at the 1920 census was 783,000, and it is now well above a million.

Taking the State of Rhode Island, with its population of 604,000, Harney County represents a population of but sixty-six hundredths of one per cent. Six-tenths of one per cent roughly; Delaware practically two per cent; Connecticut, two-tenths of one per cent; and Massachusetts (1112), 13 hundredths of one per cent. New Hampshire, it is 61 hundredths of one per cent; of New Jersey, 12 hundredths of one per cent; and Vermont it is one and 13
614 hundredths per cent; showing that we have a population, or, rather, we have 1,592 acres for each inhabitant, whereas Massachusetts has but 1.3 acres per inhabitant and Vermont has 17.3 acres per inhabitant.

Harney County generally, the large bulk of the county is an inland county, that has no drainage to the sea. The northeast corner of the county, however, does drain into the Malheur River; that is the Drewsey area. Now in the center of the county we have a mountain range called Steens Mountains, roughly 75 miles in length, that rises to an elevation of above 9,000 feet, and that is not a timbered mountain; there is no timber on the mountain of any kind. It is what we call an open grazing country, and the mountain is well watered. This mountain has probably the greatest reputation of any mountain area of its size in the West as a grazing ground. It is a wonderful grass producing mountain, well watered, and there is a vast live-stock population on that mountain. (1113.) On the north edge of the county we have the Blue Mountains. That is largely a timbered country and well watered. The central portion of the county is occupied by the Harney Valley. Harney Valley has an area of approximately 400,000 acres. It is watered by a stream from the north called Silvies River and several very much smaller streams that run in at different points, but they are negligible in its computation. The area of Harney Valley is 400,000 acres. In this valley at it lower elevation it is 4,100 feet. There is a lake of 47,000 acres, known as Malheur Lake. Connected with that is Harney Lake, with about half that area. But the two lakes are of entirely different character.

Now on the south side of Harney Lake we have the Blitzen Valley, which is watered by Blitzen River, from the Steens Mountains, and that valley is about, roughly 100,000 acres in extent, 90,000 acres of which we consider irrigated lands.

615 West of Burns we have another important valley, which is quite well watered, known as the Silver Creek Valley. Silver Creek Valley is divided into two parts, in the upper valley of which

there is now approximately 5,000 acres in irrigation, and lands adjacent to the irrigated land, making a total of about 18,000 acres on the upper valley. Then Silver Creek enters into a canyon about 7 miles long and opens into what we term (1114) the Warm Springs Valley, sometimes referred to as the Double-O Valley. The Warm Springs Valley has a total of approximately 24,000 acres, of which 18,000 acres is watered.

Now, I will refer later to the question of irrigation in these two areas, because I do not want to be understood as saying it is all under a perfect system of irrigation. It is not. However, I would like to explain that in its proper place.

Now, in the south portion of the county we have another valley that is very important to our country, known as the Catlow Valley. It is an area lying west of the Steens Mountain range that I mentioned, about 50 miles in length, running some 20 miles or more in width, approximately 500,000 acres in that valley that is level land, arid in character. The land is very fertile, but without any present source of gravity water supply for any considerable area. There are some small streams coming into that valley that I will mention under that heading, but it is not an irrigated valley, such as Harney Valley or the Blitzen Valley or the Silver Creek Valley. However, there have been some very successful dry-land crops grown in that valley and it has a potential development for agricultural purposes that is of considerable extent, but I am not mentioning that in this case, or claiming for Catlow (1115) Valley the slightest tonnage from an agricultural standpoint, but dealing with
616 it purely as a grazing ground for livestock. The northern part of the country is a timbered area, lying in the Blue Mountains. Strictly within Harney County, the elevation runs to about 6,500 feet. Then we drop over the summit into another valley, Silvies Valley, a portion of which is in Harney County, the greater portion being in Grant County, then the mountains continue to rise up to the Strawberry Mountain elevation of about 10,000 feet.

In the Blue Mountains the timber is the western yellow pine, Pondosa pine, and is all within the Malheur and the Ochoco Forest Reserves of this district. These forest reserves aord the very best summer range for cattle, sheep, or horses. Conditions are almost ideal for summer range for both cattle and sheep, and they are grazed there in large numbers.

The Steens Mountains have been used extensively, for more than 50 years, for grazing sheep and cattle and horses. (1116.)

Q. What would you say, just generally speaking now, the elevations of these various parts of the county were that you have described? What would you say the minimum elevation was and maximum elevation of these various localities in Harney County?

A. Well, exclusive of the Drewsey section, the general elevation of the valleys in Harney County is 4,100 feet. That is the elevation of Malheur Lake, and is also the elevation of the areas in the southeastern portion of the county, which we term the Alvord side of the

Steens Mountains. That seems to be the general level of all of those valleys. It varies, of course, probably 200 feet in the different valleys.

With respect to fertility, throughout Harney County, there is hardly any land in our county that, if it can be watered, will not produce the very best of crops that can be grown in that elevation. Naturally at that elevation we do not consider fruit or berries as a crop. We grow the hardy crops, the grains and the grasses, alfalfa predominating where the water can be controlled. (1117.)

617

Development along the line of subterranean water is developing quite rapidly in the Harney Valley itself. There have been three experimental wells developed not far from Burns, and on the eastern edge of our irrigated area, and these have all so far proven very successful from the standpoint of water supply. Those wells find an abundance of underground water at a depth of about 60 to 65 feet. In going to that depth I would say that there are at least two flows of water encountered before they strike what they term the third flow of water, and the water from the third flow rises in the well to within about 15 feet of the surface. Pumping is under way in these wells, but after pumping the water is reduced to probably the 30-foot level and the average lift is about 30 feet, and after that depth has been reached, that is after the well is lowered to that depth, extensive tests have been conducted and it does not go beyond that point.

As to the subterranean water sources in the Catlow Valley in the southwest part of the county—that is a very interesting field and probably a very fertile field for experimentation as to artesian water. Now on the eastern edge of Catlow Valley there are several places where springs of very large size come out. The same thing is true on the western edge, where Hart Mountain produces some water through that source, and the United States Geological Service has reported that Catlow Valley offers a very promising field (1118) for the production of artesian water. However, there has been no experiment along that line, so we do not know what ultimate development there will be. Mr. G. A. Waring made that report in 1909.

618

The subterranean sources of water supply in Harney County are gradually being ascertained and put to use; the wells that I mentioned, being the three wells near Burns, being put in within the last two years, possibly some work done three years ago but the principal work has been done within the past two years.

The largest area of land in Harney County of course is merely grazing land, but we have some considerable areas in that county that are irrigated lands, now irrigated and have been for many years. The land in Harney County produces large quantities of native grasses. The land in that elevation generally throughout eastern Oregon, and particularly in Harney County, produces the very finest quality of bunch grass, the native grass of this (1119) area, which

grows extensively on our ranges, and it has been a wonderful crop for the production of livestock in the past. That native grass is not cut and cured and put up for feeding to livestock, not that class of grass. That is on the ranges. Besides that native grass on the ranges that is not cut, there is a substantial production of hay in Harney County, at the present time and under present conditions. In Harney Valley itself on the Silvies River we have water rights and irrigated lands to the total of about 62,000 acres that are devoted to the production of hay, practically all of that being wild hay, the native wild grasses that grow on our meadows.

Q. Is the livestock industry the largest in Harney County?

A. Well, I would say it is the only active pursuit in Harney County at the present time. We are developing other industries, and within the past two years there have been some shipments of agricultural crops from our country, and it has only been within the past two years there has been any appreciable amount shipped from the county.

619 The hay on those 62,000 acres is cut. Not all of it is cut every year; some of it (1120) is pastured off each year, but there are thousands and thousands of acres cut every year. The average yield is about one ton to the acre. In that area, Mr. Examiner, there are a few hundred acres, probably a total of 1,000 acres, devoted to alfalfa, the rest of it being wild hay. The wild hay produces an average of a ton to an acre, but it does run from a half ton to two tons to the acre. Alfalfa yields an average of about three and a half to four tons to the acre with the methods under which it is handled there at the present time in that area.

There is opportunity for extensive extension of the livestock industry in Harney County over its present volume and extent. (1121.)

I have the figures for the unappropriated Government lands subject to entry. I can give you the classification of the lands in the county very rapidly. The unappropriated Government lands—that means lands that are now on the public range—amount to 3,541,653 acres, as shown by the Government reports. In addition to that there is unsurveyed Government lands, the former land being surveyed, of 35,791 acres. And in the forest reserve within Harney County 518,900 acres. Now there are entries of Government land which are pending before the department and have not ripened into title, of 563,409 acres. Permit me to say, however, that figure varies from time to time and may not be entirely accurate, but it is within a small acreage of the exact number.

Now the State school lands of Oregon amount to 180,000 acres of land scattered throughout the county, and in private lands

620 showing upon the tax roll of the county we have classified as tillable, and in that classificaiton the county assessor classifies almost exclusively the irrigated or semi-irrigated lands to the extent of 257,561 acres, and as non-tillable lands, which are grazing lands in private ownership, 1,259,824 acres, making the total for the county as shown by Government report.

When I went to Harney County in 1919 I was assigned certain work and went there primarily for the purpose of assisting in the development or the organization of some irrigation districts (1122) for the development of our irrigated lands. We, in 1920, organized Harney Valley, the irrigated area only, into an irrigation district. The total area in that district is 83,040 acres. Under irrigation within that district there are 61,230 acres that have an adjudicated water right. That land is all under cultivation in the sense in which we refer to cultivation in Harney County; that is, it is producing hay or irrigated pasture for livestock. Now when I say it is cultivated land, I don't mean it is farmed to the ordinary farm crops as they would refer to cultivated land in any other county. The plan of reclamation in that district is to store the waters of Silvies River in reservoirs on that stream and ultimately change the system of irrigation from that now in use, which merely utilizes the flood flow as it comes down during the freshet season in the spring of the year, spreading it over the lands by means of dams and dikes, and change that to a more scientific method of irrigation, by bringing the water from the reservoirs during the irrigation season.

We have made our plans for the development of that county by irrigation, or through irrigation, so that the lands that
621 are now in large ownership could be broken up and sold, and the county settled by the smaller settlers, and it was (1123) anticipated at the time I undertook this work and these projects were put under way that by the time we were ready with our projects that railroad transportation would be available so that we could go ahead with our development. It was primarily to put ourselves into a position so that when the development came through railroad transportation to the west we could immediately go ahead with the development of the county.

The studies that the Harney Valley irrigation district had made by competent engineers—I might say that we spent in excess of $80,000 for our surveys and in the preparation of our plans for the completion, or, rather, to begin work on that project, to begin the actual work. We spent over $80,000 in digging test wells and in laying out canals and in preparing plans for dam sites. The test wells I mentioned were upon the dam sites to determine foundation conditions. Now we went a little further than that. After we spent that $80,000 to determine the feasible plan of irrigation on that district, we found the cost of the district, what it would cost us to reclaim it, and the district has voted bonds to the extent of $2,200,000 for the purpose of perfecting the plan that our engineers prepared. That bond was authorized by the people, but has not been sold, and we have made no effort to sell it because conditions are not such that we could (1124) possibly do so.

Now in connection with the irrigation development of that county, experiments of the Harney County branch experimental station of the Oregon Agricultural College, we believe, have proven conclu-

sively that we have probably the highest duty possible for water in that country. The average crop that in the Snake
622 River Valley would require three to three and a half acre feet for production, with us we will produce with not to exceed 18 inches for alfalfa, and our grain crops do not require in excess of 12 inches of water and have been very successfully grown with a much less quantity of water than that—as low as 8 inches having produced profitable crops. I should probably say not profitable crops but maximum yields.

Generally speaking we do not irrigate, or would not irrigate before the first of May, under a controlled irrigation scheme, but from May 1st to July 15th will produce our best crops and best results.

As to the source of the water for this Harney Valley irrigation district—Silvies River, with its tributaries of Emigrant Creek, and the source of this water is from the Blue Mountains, and largely a large part of it comes from Grant County, the southern slopes of the Blue Mountains in (1125) Grant County draining into Harney County. We planned the storage of all the run-off of the stream from Silvies River. And that is an average of 140,000 acre feet that would be stored. The run-off of course in some years is much in excess of that, other years a little less; but we planned through the district an average annual storage and use of 140,000 acre feet.

The bond issue I mentioned was authorized to provide the cost of the dam site and of the distribution system.

I can give the figure of the cost per acre on the 61,000 acres now under water and in production. The cost of that was used and computed upon the basis of 61,000 acres, which is the present irrigated area of the lands within that district. Now there is 83,000 acres within the district, but the cost was distributed, not over
623 the entire district but over the irrigated lands only, and the estimate of our engineers was that the storage would cost $10.00 per acre foot. Now allowing a storage quantity of two and a half acre feet per acre would make the storage cost $25.00 per acre, and a distribution cost in proportion to the (1126) 61,000 acres was $13.50; total $38.50 for the water right.

The maximum duty of water in that district delivered at the land would be 18 inches, or one and one-half acre feet during the irrigating season, May 1st to July 15th.

It is necessary in Harney County to provide hay for winter feed for livestock. You can not successfully continue in the livestock business in Harney County without ample winter feed for livestock.

Q. When the surface waters in Harney County were first utilized how was it done; by storage and distribution, or not?

A. No; on the countrary, irrigation has developed gradually throughout Harney County. When the first settlers came into the county they found the lands that are now meadow lands and cutting hay, growing a different kind of hay, but it was all wet through swamps and swales and sloughs that penetrated the country. This

area absorbed the spring freshets and produced rather a coarse grass. Now when they came into the county, of course in small numbers and with a small amount of stock, hay was not required for feed purposes to the extent that it is to-day. Their cattle would wander in these swamps, if you term them such, but in this coarse hay, tule, and sugar grass, annually they would cut enough hay for their horses, saddle animals, for their older cows and their sick animals (1127), until they just gradually increased that, until now they have utilized the entire freshets flow from all of the streams in the county and are using that overflow land for the production of hay, the
624 largest portion of which is cut for hay and cured, some of which, however, is pastured off in the fall months and during the winter months. Now this development has changed the growth in this area, and instead of being the coarse tule, rough hay that they had in the early days, they have a very fine grade of a natural wild hay, red top, some timothy, in other areas considerable quantities of sugar grass, and it is a very desirable quality of hay produced under those conditions.

As to the latest date in the spring that water is available from the spring freshets in Silvies River and other streams for flooding the adjacent lands, that varies considerably with the year. However, I would say that there is always water up until the first of June, and in favorable seasons, I would say average seasons, the water continues in good quantity up until June 15th. But from June 15th on the water fails very rapidly and we are fortunate to have sufficient water to divert from the streams to more distant lands even for stock purposes after that. Some years, however, there is a good flow of water in the stream up until the 15th of July. This year the water continued in the streams (1128) in good quantities until after the first of July and was diverted considerable distances for stock water. There was no irrigation after that date.

As to the Blitzen River reclamation district, practically the same course is pursued on the Blitzen River. On the Blizten River we have a little different condition from that in Harney Valley, and in 1921 the Blitzen River reclamation district was organized as distinguished from an irrigation district in Harney County. I would say that that was done, however, for the purpose that our problem could best be worked out through a reclamation district rather
625 than through an irrigation district on that area. Drainage was necessary over there originally, and a considerable drainage works had to be constructed before the reclamation of the land could be undertaken through irrigation. Now, we organized that as a reclamation district with a total area of 60,000 acres. Now there is in production in that district under water, irrigated annually, 34,650 acres by actual measurement, by survey. (1129.) The entire 60,000 acres within that district, however, is irrigated, with the possible exception of 1,200 or 1,500 acres; I don't have the exact figures. This includes or contemplates in the construction of this reservoir the flooding of about 12,000 acres of land that is now in

production of meadow grasses, it being necessary to build the dam at a point where it would flood some of the meadows that the company now owns.

Now, we went through the same process in that district. We employed competent engineers, the best obtainable, and prepared plans for the storage of our water and the distribution of the water after it was stored, and the drainage of the land, so that we could take care of any drainage problem that might arise. The cost of that was in excess of $25,000. I am not able to give the exact figures of the cost of that, because some of that work had been done several years before and was assembled and we worked it into the data that we prepared for that district.

As to the source of the water supply for that district—this project takes the water of Blitzen River, which comes off of Steens Mountain. That is an extremely dependable source of supply. We have conditions there probably not necessary to discuss, that make it a much more desirable stream than the Silvies River on the north. (1130.)

626 I mentioned this was a reclamation district. Under the Oregon law we have two kinds of districts that we use in our country; one is an irrigation district, which contemplates merely the storage and distribution of water, and the other is a reclamation district, which primarily contemplates the drainage of an area and its subsequent reclamation by proper method of controlled irrigation. This Blitzen River reclamation district was formed for the purpose of carrying out that last object that I mentioned. The law is a little bit different in relation to the two districts. And I might say this, so that there will be no misunderstanding on that score. All the land in the Blitzen River reclamation district is owned by one company, except three small tracts which are in the hands of the directors, primarily to qualify them as directors of the company. It is the property of the Eastern Oregon Livestock Company.

The ascertained cost per acre on these 34,650 acres now in production, including drainage, storage and distribution system, is $25.00 an acre. The irrigation season in this district is the same as on the Silvies Valley, May 1st to July 15th (1131.) The duty of water in this district is the same as in the Harney Valley. There might be, with development, a little more, probably 25 per cent more required on the Blitzen Valley, due to the character of the soil, than on the Silvies Valley, but we believe not. We think that the same duty, 18 inches delivered at the land, will be sufficient for a maximum crop.

I am not connected with the organization of the Silver Creek irrigation district, but I have information from authentic sources regarding it. It was organized in 1918. It is located on Silver Creek—the center of the district is about 35 miles west of

627 Burns. It is in the northwestern portion of the county. The area in the district is 18,300 acres. (1132.) We consider the irrigable portion at 16,000 acres. That is the area which, if water could be supplied to it, would be suitable for the production of crops;

that is, high class land. There is 3,400 acres now within that district alone that is irrigated from Silver Creek. Now the district does not include even all the upper valley of Silver Creek and lying below that, and irrigated lands from the stream and now having water rights will increase that to about 5,500 acres. I don't have the exact figures but it is about 5,500 acres on Upper Silver Creek.

These 3,400 acres now under water are strictly devoted to the production of hay; some alfalfa, principally wild hay. There is some grain, but that is a very minor crop. There are a few hundred acres that are planted to barley and rye, but that is an incidental crop on the stream. However, there has been enough raised there to demonstrate that it is a high class grain country, if there was any occasion for growing it in quantities.

As to the amount of the water storage from the waters of Silver Creek, the contemplation was that they would store 40,000 acre feet, and they have a reservoir site which is adaptable to the storage of that amount of water, and it is a high class reservoir site.

The estimated cost of the Silver Creek storage dam was $300,000, and the distribution system was estimated at $185,000. Now that estimate was made in 1918, and I believe it is possibly 10 to 15 per cent below what an estimate at the present time would show the cost would be.

The maximum duty of water in that stream for the crops that we grow in our country, delivered at the land, would be 18 inches to produce the best of crops. But the district has allowed up to
628 30 inches for the production of some crops.

The irrigation season is the same thing as in the other districts, May 1st to July 15th. The cost per acre is estimated at $65.00 per acre for the complete project, that is, for putting 16,000 acres under water.

The Trout Creek irrigation district was (1134) organized in 1922. It is located on Trout Creek in the southeastern portion of Harney County, about, I would say, 150 miles south and slightly east of Crane. There are 2,600 acres included in that district. (1135.) I don't want to go into too much detail. I do want to get these facts into the record. Of the Trout Creek irrigation district there has been under cultivation for a good many years 1,400 acres of land. This 1,400 acres of land is producing practically the same kind of production as the other districts that I have mentioned, have grown grain successfully, and some alfalfa hay, in that district. They retain for storage in that district 10,000 acre-feet of water, which will bring in cultivation the full 2,600 acres, and the cost of that storage and the distribution system is about $290,000.00, roughly, and the cost will be, roughly, $55.00 an acre when they bring into production the remaining lands that can be irrigated from that storage.

Now the district proposed in that instance, and organized on the basis of 2,600 acres, proposes to irrigate about 6,600 acres that lie in the same valley, all of which is very high class land, and with

the 6,600 acres in the project sharing in the cost it would amount to about $55.00 an acre. This irrigation is well away from the present railroad terminal at Crane, or railroad line at Crane,
629 and is treated a little differently from—in my general view of conditions in that county, from the other districts that I have mentioned, because they are directly on the railroad we propose.

Now, in addition to these irrigation projects, I just want to mention the fact that in Harney County on the branch line (1136) that now exists running up to Crane we are closed to the Jordan Valley project in Malheur County than any point that has been mentioned. That hasn't been brought out in the testimony of any other witness, as I remember. We are approximately 65 miles from the center of the Jordan Valley irrigation district at Venator, and there has been quite a bit of trucking and freighting across country to the Jordan Valley project from our country. I merely mention that for the purpose of showing that if in the event this cross-State line is built it is extremely reasonable to presume that much of the western bound movement of produce from the Jordan Valley project will come out by way of Harney County.

As to the acreage in the Jordan Valley project, that has varied so much that I am unable to say just now what they plan to reclaim. They have had several problems over there in the last two years that I haven't kept track of. I think, however, that it is safe to say that there will be within the near future the development of 8,000 acres of that project that would be ultimately cultivated. There are something like 2,000 acres of it now, under cultivation, if my memory serves me right. I am not speaking of the old irrigated lands in that area, but the new lands brought under cultivation by virtues of the irrigation (1137) district they organized.

I don't have accurate figures on the number of acres of the older lands already under irrigation. My estimate would be in the
630 neighborhood of 2,500 acres additional.

I know where the Jordan Valley products at the present time are marketed. Livestock is driven out towards Murphy, and also delivered at Homedale, and some probably was formerly delivered at Caldwell, but the principal markets there now are Homedale and Murphy, Idaho. It is very probable the construction of the cross-State line would change that condition on shipments taking place during the spring and fall months. It is rather a dry country and arid country between the Owyhee River and Venator, not a practical drive for livestock during summer months, but in fall it is entirely practicable to drive the livestock across the country, and it is entirely possible that a considerable amount of that livestock would be shipped westward, coming into Harney County for shipment over this railroad. (1138.) Jordan Valley being distant as it is from market, they have got to concentrate their products in some form that they can haul conveniently or chiefly by truck or walk it out on foot, and my judgment is that that project is going to grow into a dairy product, in concentrated form, and into livestock and

feeder stuff to be walked out. There will be no grain grown in that project except for local consumption.

I am quite familiar with conditions around Brogan and on that project. I will state how I obtained my information. I was practicing law in Vale and Ontario both from 1909 to 1918. During that time I was engaged in practically all of the litigation that took place on Willow Creek, both in the adjudication of the water rights and in the troubles that followed on the Willow Creek project. The
631 fact that there was some discussion this morning by witnesses as to the troubles that existed on that project does not decrease the water supply on the stream in the least. The fact of the matter is that the Brogan or Willow Creek, Oregon, project never was feasible and never was justified from the standpoint of the cost involved. It was undertaken originally without any investigation, and a very large sum of money was spent to store a very limited amount of water. Now, following that investment, they applied the water to the land and attempted to irrigate more land than they had water for. This resulted in litigation. There actually is approximately 4,000 acres of very high quality of land that that reservoir will irrigate safely here and that there will be an ample amount of water for, and that land lies up in the vicinity of Brogan. Now, the company that undertook the development of this project went 7 miles below Brogan and acquired a large acreage of land in the vicinity of Jamieson, and they attempted to develop that land to alfalfa and to some large orchards. As a result of litigation they were denied the use of the water which formerly had been divided up between the Brogan area and the Jamieson area, and, being denied the use of the water, they couldn't maintain their orchards, and they had to let them go. However, this water is being used on an equivalent area of land in the vicinity of Brogan, and it is certainly one of the garden spots of the Northwest—limited in area, but a very fertile and a very productive area.

I have prepared a table giving estimates I have made of the probable production of staple crops on the Harney Valley project and the Blitzen Valley project and the Silver Creek project. (1140.)

The comments I just made relate to the Willow Creek project in the Malheur country, in the vicinity of Brogan and Jamieson.
632 There was some discussion this morning by witnesses as to why an orchard was abandoned down there, and I merely wanted to explain that situation.

I prepared the tabulation you passed around. It represents the possible production of staple crops on those projects.

(Said statement was thereupon received in evidence, marked "Complainant's Exhibit 22, Witness Duncan.")

Now, in the preparation of this table I went through the reclamation reports of the U. S. Reclamation Service, and from my knowledge of various reclamation districts that I have visited in the past, and some knowledge of what they were (1141) doing, I took the reports of the Minidoka project in Idaho, which lays at the same ele-

vation as our project in Harney County, 4,200 feet, and conditions are very similar, and also the crop reports from the Klamath reclamation project in Klamath County, and then compared the reports on these projects, the crop reports on these projects, with the results that had been obtained in our county by the experimental station, as well as by actual knowledge of the crop yields in our county.

Now, the first item which I have carried through with these three tables is sugar beets. Now, in order to explain why I included that, permit me to say that the Bureau of Agriculture has during the past year put into the field in Harney County an entomologist to study the question of sugar-beet production in Harney County. It seems from all reports and from the Bureau of Agriculture that the sugar-beet industry in southern Idaho and Utah is failing because they are afflicted with a pest called a white fly. It blights the beet and it keeps their yield down very materially. Now, the investigation is being made by the department and has been conducted now for a period of four or five months to determine whether or not the
633 Harney Valley area will be free from that condition, and Mr. Wallace, who is in charge of that work in Harney County, is in the field every day, has visited every area of the county, and visits (1142) every area of the county at frequent intervals to watch the development of the white fly. Now, the white fly is not dependent upon the beet crop. He is a native of the country, and as I understand it, its development is dependent upon weeds and other vegetables growing in the country for production. He merely feeds on the sugar beet, and this fly has not been found in Harney County except in very few instances, and Mr. Wallace reported to me a very few days ago that it was his judgment, after having studied the situation for several months, that Harney County was going to prove an ideal sugar-beet area. Now, in connection with this, companies that I have been with have conducted quite extensive experiments as to the production of sugar beets—this is on plots, not under field conditions—on these plots, and we have found that our soil, our climatic conditions, and our water are ideal for the production of sugar beets, and it is only, of course, a presumption, but we believe it logical that in time—and I don't care to state how soon it will be—but in time we are going to have an important development of the sugar beet industry in Harney County. Every element that makes for its favorable development is to be found there, and we are working hard to bring that about.

Now, one of the problems that we first encountered in working out the sugar-beet industry was the question of heat, coal (1143), or fuel for the reduction process that is necessary, and I am trying to say that sugar-beet experts, engineers, and agricultural
634 experts who came into the territory to investigate it from that standpoint, had reported against it, because of the fuel cost, but we feel that we have absolutely overcome the question of the fuel cost, because in conjunction with the sawmill industry which will

be developed in Harney County—and I will mention that later—we are going to have a vast quantity of surplus fuel from those sawmills, which is now simply burned to get rid of it, that will be available as fuel for sugar refineries. Their run is only a few weeks in the year, whereas the surplus sawdust product, which is a very high-grade fuel, can be had at a very small cost by storage on yards provided for it.

Now, I don't care to be understood in this table to say that it is my judgment that this will be the absolute acreage that will be produced in these various crops. I say that this is a possible production of the present irrigated lands in the county, and this table does not take into consideration the fact that the Harney Valley irrigation project can be developed from 61,000 acres to over a hundred thousand acres, and the Blitzen Valley project can be developed far in excess of 34,000 acres. We have other projects that can be developed far beyond these figures, and I feel that in using merely our present irrigated area on the Blitzen and Harney Valley (1144) projects and the 16,000 acres on Silver Creek that we are using a very conservative area for the basis of computation.

This statement of mine does not contemplate, so far as sugar beets are concerned, any rail haul of the sugar beets; only locally from the point of origin to its common point in the valley itself.

Q. I know; but did it contemplate, so far as sugar beet is concerned, the construction and operation of factories for the
635 manufacture of beet sugar in Harney County?

A. That is what it contemplates entirely, the development locally.

Q. Well, then you estimate the production of sugar beets would contemplate some rail movement of the product, would it not? (1145.)

A. Entirely so. Now, in this table, Mr. McCulloch, I do not attempt to say that this tonnage which I have estimated is all rail tonnage. I don't believe that could be the case. I think that the wheat, the barley and the oats and the alfalfa very largely, very much of it, will be consumed in our own country. I am not competent, as a matter of fact, to reduce this crop that I have estimated that we can produce to tons of meat, or to carloads of sugar, or matters of that kind, but I do believe that evidence and the commission are perfectly competent to reduce that and from that ascertain that there will be a substantial movement of these products from our county, either in its present form or in its finished form.

The product of beet-sugar factories would be first, sugar. And then the refuse is a very valuable product, by-product from sugar factory, which would be a very valuable food product for livestock in that valley.

Q. Now, what have you to say with respect to the other commodities, or have you said everything you wanted to about the other commodities that you have shown on this statement?

A. I think that the table speaks for itself. (1146.) Now, I want to say, in explanation of that, that I have tried to be and have been extremely conservative in the quantities that I have estimated would be the yield per acre.

636 I can state what period of time, by what date, we anticipate this production that I have estimated will be realized. Basing my estimate upon the fact that in 1925 the railroad started in operation into Burns—it was completed a little earlier than that, but they put a schedule on into Burns, and immediately our farmers began the development of a wheat crop, until last year the wheat shipped from Burns alone was approximately 1,000,000 pounds. Now, then, in two years it gained from nothing to that point by reason of the construction of a line into Burns, and I believe it reasonable to say that if the cross-State line is built that immediately, anticipating the completion of a road, that the minute the road is under construction and there is an assurance that it will go ahead, that our irrigation projects will take a new lease of life, agriculture will develop, will begin immediately, and this crop will begin to move by the time the railroad is completed.

It is my judgment that when these projects produce this amount of tonnage as estimated by me that all (1147) of the tonnage so produced, with the exception of sugar beets that I have mentioned, will be hauled out to some market by rail, either in the form in which I have mentioned it or in beef, which will be our primary production. Now, I think there is a generally accepted standard that a ton of alfalfa will produce 60 pounds of beef. That being the case, it is merely a matter of computation as to how many pounds of beef our alfalfa production will bring about. The same thing is true of the wheat and barley and oats. All that, if not shipped—and there probably won't be much except the wheat shipped in its original form, coming from the field—will be reduced to the finished product of beef, and in that connection I want to say.

637 that I will be followed by another witness—that I don't believe from my observation and knowledge of that country that there is a better or more productive country in the West for finishing beef, fattening it and putting it onto the market in the very best possible condition as prime fat beef, than Harney County if we had rail facilities for getting it to market. We don't have that to-day, and with the construction of the cross-State line to the West these products that can be fed to beef will be fed to beef on our feed lots during the winter months primarily and will be shipped to market in a finished fat form, instead of going into the distant market as feeders. (1148.)

I would say that a very considerable portion of the tonnage I have estimated on this exhibit would be available within the five-year period for this cross-State road. I would say that within the time that this road can be constructed 15 or 20 per cent of this production will be available.

I went over Mr. Teutsch's exhibit for Harney County. I think he is altogether too conservative on his areas, and on the amount that he has estimated as being available from that county, altogether too conservative. As a matter of fact, I think my figures with the exception of sugar-beet production there, 10 tons an acre, is a little more than 50 per cent of the possible acreage, and I base that statment upon actual knowledge of extensive production in the irrigated section of the county.

Irrespective of differences between my estimates and Mr. Teutsch's estimates, this statement represents my best judgment, based on my experience and observation and study of conditions in Harney (1149) County.

There is almost 6 million acres of grazing land in Harney County.

That grazing land in the county will indefinitely support
638 a very large livestock industry. For all time I look to see the livestock industry the predominating industry of Harney County. Agricultural production in Harney County is going to be entirely subordinate to the production of livestock. I mean by that that the irrigated areas of the county are going to be farmed and irrigated and controlled for the purpose of production of beef. We are not going to be primarily a wheat production center, or anything of that kind. We are going to produce beef.

Q. Mr. Duncan, before I forget it, I wanted to ask you one question about this Brogan project irrigated from the waters of Willow Creek, and this Jamieson development. Was that a project undertaken by the State of Oregon, or (1150) by the Federal Government?

A. Neither one. It is entirely by private enterprise, by some Chicago interests. The Barlow Trust Company of Chicago were the first organization back of that project.

Q. All right. Now, I would like to have you state, in addition to the major irrigation and reclamation projects that you have discussed, what additional irrigated lands in Harney County there are that are capable of being irrigated or are being irrigated now, the amount of acreage in those various tracts, and their approximate distance from the route of the proposed cross-State line?

A. Well, entirely in addition to the lands that I have mentioned in these irrigation projects there is a total of, in round numbers, 40,000 acres of irrigated land in the county that is producing hay, a small amount of grain, and possibly a small amount of irrigated pasture—by that I mean high class land as being irrigated and the grasses instead of being cut to hay are pastured off each year.

(1151.)

639 PORTLAND, OREGON, *Aug. 9, 1928.*

Now taking up dry farming in Harney County: Out of a total of 6,000,000 acres of lands in Harney County in excess of the irrigated area that I have mentioned, there is at least 500,000 acres of that area that is so situated and of such nature that there has been more or less dry farming on it. By dry farming I mean a

cultivation and tillage of the soil without artificial irrigation for the purpose of producing crops, such as the hardier grains, particularly rye. Now, it is true that this has not generally been a success in our county, and has been abandoned very largely. That fact is due to several factors. The population of the county has decreased, due to several conditions, principally due to the fact, I believe, that there has been a lack of transportation across the State giving us an easy outlet to market, and making the production of any of our crops that will be marketed in that manner excessive—that is, the cost will be excessive, and has discouraged the (1152) development of any of that class of land. Now, whether it would be largely profitable to farm that land I am unable to say, but I do say without hesitation that there would be annually a very large production of that class of crops from our dry farm lands if we had a through transportation system that would bring into our country people who are now discouraged from coming into the country, because we are at the end of a long branch line and are so very much isolated from the rest of the State.

On considerable areas there has been successful crops of wheat and barley grown on the strictly dry land. I have in mind one valley that we call the Virginia Valley, about 15,000 acres in extent. Practically all of it at the present time is cleared and has been
640 in cultivation—not every year, but it has all been in cultivation to wheat and is now producing large crops of wheat for dry land, the yield running up as high as 25 bushels to the acre in favorable seasons, and from that down to about 10 bushels to an acre in seasons which are below average, but it does grow very successfully.

In my judgment, the dry farming of lands in Harney (1153) County would be stimulated by the construction of the cross-State line, several hundred per cent, I should say, and such increase in cultivation would begin immediately after we got assurance of the construction of a cross-State road. I think the total aggregate production under dry farming in Harney County would be very large with the cross-State line built. I am unable to give figures along that line as to what it would be, but it would be very large.

Now taking up livestock in Harney County: In my comment on the livestock industry yesterday and the utilization of the crops which I believe our present irrigated areas will produce, I referred to cattle quite often in my testimony, and also used the term "meat." I didn't mean to leave the impression that our total product would be cattle. Sheep is one of our leading industries, and we would produce a very large amount of finished mutton that would be fed on our feed lots and shipped largely—or would be shipped in much larger quantities to western markets. The western markets are increasing very rapidly, particularly as to the proportion of mutton that is being used in our western markets (1154), and with a cross-State road our lambs which are now going out as feeders, will in large numbers be finished on our feed lots and be shipped to our

western markets, particularly to the San Francisco area, the Bay cities.

641 Now, I think it very significant to point to the fact that the livestock industry in Harney County has been on the decrease, rather than on the increase, for a number of years. That has been brought out in the testimony of other witnesses, and it is my judgment as well as the judgment of all of the stockmen in our county, that our present cattle population is 50 per cent below what it has been in the past, and many of our more prominent stockmen who are well informed insist that we don't have more than 25 per cent of the stock that we formerly carried. Our ranges will carry 100 per cent more cattle than we are carrying at the present time without depleting the range and without decreasing the carrying capacity of the range for sheep. There are now approximately 50,000 head of cattle in the county, and that can be readily increased to 100,000 head, and is being increased very rapidly under present conditions.

The decrease in the cattle production is due largely to the deflation period following the war, when cattle were forced into the market by those holding loans against cattle (1155) in particular. Conditions are much more suitable at the prasent time, prices are more satisfactory, cattle are being produced at a profit, and people are rapidly again building up their herds.

I expect to see the livestock industry in Harney County get back to what it formerly was. Even under present conditions it will get back to what it was in former years. It may take two or three and maybe four years to grow into that state, and I do say that with the construction of the cross-State line it will so simulate it that the reproduction of our herds will be supplemented with shipment of stock cattle into the area. In fact, that condition is now being brought about to some extent and it will go forward very

642 rapidly. I would say this, that it is the estimate of all of our stockmen, and it is my judgment, that with the construction of this cross-State line, giving us an entry into the Bay cities cattle markets, also into Portland, that it will actually increase the value of every head of cattle in our country—I mean by cattle, the cow of the breeding herd—not less than $10.00 a head. Estimates are placed much higher than that by some of our men in that country who are very well informed, and that would be a very conservative estimate. (1156.)

The development of Harney County began comparatively recently; about 1872 we began the development of our country, when the cattlemen of California and southern Oregon came in there for the purpose of pasturing their herds and developing the country, and from 1872 and up to the present time development has been gradual to the point that I have mentioned. Up to 1916 the closest railroad point that we had was Ontario, Oregon, 145 miles distance by average drive, from our county, and the fact that during the development of our country we were isolated compelled the settlers to develop

the livestock industry so that they could market their products on hoof.

At the present time if we want to ship cattle or sheep or horses from Harney County by rail to Portland or ports north of Portland they must be shipped by rail either from Burns or Crane or Benator, and then travel generally eastward to Ontario, where they reach the main line of the Oregon Short Line, then they skirt the east and north borders of the State of Oregon, reaching Portland, for diversision to Seattle generally. Of course, Seattle could be reached by another route, but that is the route that is travelled by our livestock. (1157.) They must travel east from Burns, a distance
643 of 160 miles before they begin to go north and west.

Q. Now, if you want to ship Harney County cattle, or sheep or horses to San Francisco, or California markets, what route must they take out of the county?

A. For years, the few that have gone into that market—and it is a very limited number that has been shipped by rail—they would go either by way of Portland, then to San Francisco, or by way of Ogden. The distances are almost equal. I would say, however, that comparatively few—and I have in mind no shipments of that nature, except shipments that have gone into Portland and been confined by the grower to Portland, and then bought by the California buyer and re-shipped to San Francisco—probably a good many of our cattle have reached the California points that way, but I have no record of it; but the practice of our stockmen has been to drive their stock overland to Winnemucca, Nevada, a distance of 250 miles, and there ship to San Francisco, and this has been the movement of a very considerable portion of our livestock from Harney County. The long shipment by way of Ogden and Portland makes it entirely impracticable for the stockmen successfully to ship (1158) cattle to the San Francisco market.

Q. Now, would the construction of the cross-State line provide a shorter and quicker route to Portland and all points north than you have by existing routes out of Harney County?

A. It would very materially shorten that distance, and by virtue of that fact our livestock leaving Harney County would reach the market particularly of Portland in a very much better condition than they now do going around by the present route, and it is
644 that fact, that we would get a less shrink and cattle would reach Portland in better condition than they can now under existing conditions, that will tend materially to increase the value and the quality of the animal delivered. The saving in distance to Portland would be in excess of 150 miles over our present line. That proposed cross-State route would also to a much greater degree save distance and time in getting cattle, sheep, and horses to the California markets. Another advantage that the cross-State line would bring to our livestock men is that the California buyer would be able to come to our territory and purchase this stock for direct shipment to San Francisco (1159) and bay points, or would

meet our livestock shipments at the junction in the vicinity of Crescent, and we could divert our shipments then to California markets as conditions might warrant. Of course, market conditions control those factors, but that is the thing that would do more to stabilize our market than any other one thing that could possibly be done.

I have figures with me as to the carload shipments from Crane in 1923 of cattle, sheep, wool, hogs, horses, and meat.

In 1923 the cattle shipments were 234 cars; sheep, 168 cars; wool, 24 cars; hogs, 11 cars; horses and mules, 8 cars. In that year a very large number of cattle were driven from the Harney and Blitzen Valleys to Nevada points for shipment to California. That year was about an average year for the number of stock delivered to California by way of Winnemucca. If anything, it might have been slightly in excess of the average drive, but there was 15,000 head that year driven (1160) overland to Winnemucca, Nevada. Now, I say average year—I mean up to that year. I believe, however, that since 1923 the deliveries to Winnemucca have been less.
645 That is due to the fact that some of our largest producers of cattle in that country have gone out of business and are entirely out of the cattle raising industry. (1161.)

During the same year there was approximately 2,000 head of cattle driven from Harney County into the Klamath Falls area. Cattle are still delivered that way.

Since 1923 and the years subsequent, there has been substantial shipments of cattle, sheep, wool, hogs, and horses by rail from Crane; larger numbers than there were in 1923, in my judgment. I don't have the figures as to the actual number shipped during succeeding years. If in the year 1923 the proposed cross-State line had been built and in operation, in my judgment by far the largest proportion, practically all of the cattle, would have moved westward. There would have been some movement of cattle, however, eastward to Ogden and to southern Idaho feeding points, depending entirely upon market conditions, and I don't have them in mind just now. Probably 25 per cent would have gone that way. But with the increased facilities for reaching western markets, and California markets in particular, the tendency for eastward shipments would decrease.

As to the cattle that were driven to Winnemucca and to Klamath Falls from Harney County in 1923, in (1162) my judgment not one of them would have been driven to those points if there had been the cross-State line built and in operation in that year. I am very certain of that in my own mind, that not one of them would have been driven overland, if we had had a rail connection as proposed. I believe all of that 17,000 head of cattle would have been moved by rail over the cross-State line west. That would have made
646 about 575 carloads. Now as to sheep the condition is somewhat different. Our markets are not all westward for sheep, but the sheep market and the consumption of sheep on the Pacific coast

is increasing at least in proportion with our increase in population, which has been 32 per cent in California in the last six years, and the northern California market is now taking really about 350,000 head of lambs, and of our sheep it would be a very conservative estimate to say that 25 per cent would move to western markets, San Francisco, Portland, and Seattle particularly, and principally to the bay cities.

The Pacific Livestock Company has extensive interests in Harney County. They own about 120,000 acres of land (1163) in the county still.

Q. Is that company, if you know, interested in the construction and operation of this proposed State line?

A. Mr. McCulloch, conditions in connection with the Pacific Livestock Company have changed very materially since the former hearing in 1923. They have been forced into liquidation, and the management of the company has changed hands. In 1923 and '24, when we were holding the former case, they then owned and operated the largest killing plant slaughter house, in the bay region. They have since disposed of that and they are now actively disposing of all of their properties. They are intensely interested in the construction of this cross-State line. Their properties are being divided and subdivided and sold, and they are passing into the hands of the smaller livestock raiser. Their plants, particularly the cattle plants, or livestock plants, some of them, are admirably suitable for sheep raising, and they are moving into the hands of smaller owners at the present time.

I have made estimates of the saving in time in reaching
647 Portland and San Francisco markets that could be effected by the use of the proposed cross-State line when built, in the transportation of livestock from Harney County. The general impression among livestock men, and my own judgment is, that it would cut our running time in half (1164), particularly to the Portland market; and the same thing is true of the San Francisco market. That would mean a day is consumed in reaching the market, not exactly in running time alone.

Q. Have you made any estimate translated into terms of dollars per head, of the saving in freight, shrink, and shipping expense that would accrue to the livestock producer if he had the opportunity of using this cross-State line?

A. Under present market conditions the saving would be not less than $10 a head, and unquestionably on steers in particular of the heavier type, ranging from 1,200 to 1,300 pounds, the saving would be in excess of that.

As to the timber development in Harney County: It is very essential that the commission should understand that condition in this county. I do not have the accurate figures, but I have a very thorough general knowledge of that situation. Directly tributary to Harney Basin there is approximately 9,000,000,000 feet of the western yellow pine lying in the Malheur and the Ochoco Forest Reserves.

There has been sold and is under development now a project to mill a tract in Bear Valley and surrounding Bear Valley of 890,000,000 feet of pine timber. The other varieties of timber, fir, larch, hemlock, increase that amount materially. However, these (1165) are minor species for which the market conditions are uncertain, and we don't use the estimates of that tonnage or that stumpage in going into the question of values or development.

648 This area has been sold by the Government. There is now constructed from Burns, Oregon, northward to manufacture that timber, or bring out those logs, a railroad 50 miles in length to Seneca, that is a common carrier built as a feeder for the Oregon Short Line where it connects at Burns, Oregon. That is the Malheur Valley Railroad, but it is generally referred to as the Fred Herrick road, and it is a very high grade construction and a first-class road—better than what would be referred to as a logging line, by far.

As to the policy of the Forest Service in cutting this 890,000,000 feet of timber: The forest reserve has adopted the policy of the perpetual cut of timber in each given area where such a policy is at all practical of operation, and in this area they first put on the market this one unit of approximately a billion feet of timber and reserved four other units of similar size around it for successive cuts. Their operation is based upon a 20-year period in this particular area. They estimate that under the plan and contract which they have entered into, this unit of 890,000,000 feet of pine will be cut off in a 20-year period. (1166.) Succeeding that period they will cut off another unit of similar size, in the succeeding 20 years, and so on until they have cut over the four units, which I know was the policy they adopted at the time the original sale of this timber was made. By that time, when they have cut the fourth circle, they will then resume cutting on the unit which they are now working on, leaving at this cutting the immature and young timber, which at that time would be ripe and ready for development. And in that manner they have a successive cut and perpetual cut.

649 Now that would take from the Harney County area approximately four million feet of timber reserved for this one operation, but with the nine billon feet which is in that area and tributary to Harney County it would permit them to put in another unit of this size and still have a very large amount of timber for the smaller operators in areas where it is not practical to reserve it under the perpetual production theory of the Government, and that is their policy at the present time.

This 890,000,000 tract of timber will be milled at or near Burns, Oregon; and that is the contract that the purchases entered into with the Government.

Q. Is there a sawmill now constructed near Burns for that purpose, on the line of railroad from Burns to Seneca? (1167.)

A. There is a mill now 50 per cent or more complete. The cut of that mill is estimated at 75,000,000 feet a year.

Q. (By Mr. McCULLOCH.) Do you know how much in thousand feet board measure of western yellow pine lumber constitutes approximately the average carload?

A. I believe it is 20,000 feet, the average. Now I am not informed on that, Mr. McCulloch, but I have heard that figure, from 20,000 to 25,000, depending upon the size of the car. So that by the use of those two factors, 75,000,000 production and 20,000 or 25,000 feet per car, the number of cars annually of lumber for shipment out of Harney County can be ascertained. I have not attempted to reduce that to carload shipments. I know it is very material, but I don't know just what it is offhand. I can compute it.

Q. The point you wish to make in this connection was that under the policy of the Federal Government in the sale and cutting of this timber an indefinite supply of timber from those forest areas is intended to be provided for all time in the future? (1168.)

650 A. It will, and it will be contributing to the Oregon Short Line as it now exists over the branch line at Ontario, and we feel that that should be taken into consideration as a supporting factor for the cross-State railroad, even though under the present conditions it has an outlet.

We expect some tonnage for the cross-State line out of the Bear Valley timber project, making that explanation in this way: The line from Ontario to Crane was brought up there with the destination, or with the intention of the builders of that line to go across the State. Circumstances compelled them to stop at Crane, Oregon. Now it is true that this timber will reach Crane, Oregon, over existing lines and that it is not necessary as far as the marketing of this timber is concerned, to complete the western unit, but we feel that this tonnage should be computed and credited to a cross-State line as a contributing factor for the support of the cross-State line, under those conditions. I do not believe that there ever was any thought in the mind of any of the railroad officials that the construction of the line to Crane, Oregon, was warranted from the standpoint of the tonnage that they would reach at that point. It is simply a dead end; it penetrated an expensive canyon from Vale to Crane, a very large investment was made, and it was not built in there even as a feeder for the Oregon Short Line, but it was built with the expectation that they would go directly across (1169) the State.

The western yellow pine in northern Harney County and that tributary to the line from Burns to Seneca, is a species of timber that naturally reproduces itself from seed. That is demonstrated thoroughly in our area. There is a very large second growth on all the areas that are protected.

651 There is quite a considerable acreage of timberland in Harney County that is in private ownership, and there is more than a prospect—there is a reasonable certainty—that there will be several small mills of fair capacity that will begin milling their timber within the near future if the market conditions will warrant,

which we believe they will, and will be contributing factors to the timber tonnage.

The lumber that is to be manufactured in the mill at Burns, in reaching eastern markets, would go over the existing Oregon Short Line branch, or the O.-W. branch, from Burns to Ontario and there connect with the Oregon Short Line from Burns to Crane. It would go by way of Crane and from Crane to Ontario and then on east. (1170.) That lumber would traverse in the State of Oregon before it left the State in going east, 160 miles, roughly, from Burns to Ontario and 14 miles to Nyssa. That would be about 174 or 175 miles in the State of Oregon.

I would say that while there are some mineral prospects in Harney County, that they cannot be used as the basis of computation for any tonnage. They are too remote from the railroad and their development and values are too low to be considered as a contributing factor to railroad development in the light of anything we know at the present time.

Q. You are not counting on the development of mineral products as furnishing tonnage for the proposed cross-State line from Harney County?

A. Not in the sense that we consider ores, gold, silver, lead, or anything of that nature; but there is a possibility in Harney County which I believe should be called to the attention of the com-
652 mission. And that is that in Harney County we have a condition somewhat similar in general description to what will appear in the (1171) record hereafter as the Alkali Lake region. I believe there will be witnesses to describe a very extensive deposit of soda ash in that area. Our county has much that same situation, in that we do not have a drainage outlet to the sea from the county and our waters are deposited at the lowest points in the various lakes, Malheur and Harney Lakes, and there through the process of evaporation the minerals have been deposited in Harney Lake region and in the Stinking Lake region. Now, I am not sufficiently expert to say that that will ever be developed from a mineral standpoint, but I would say this: That it is the common statement that Mr. Jim Hill, in a public address—I mean the railroad builder—made in Burns, Oregon, some years ago, made the statement that if Germany or any European country had the deposit of Harney Lake and what we call Stinking Lake, within its confines, it would be independent from the fertilizer standpoint from the rest of the world; that it would produce a sufficient amount of nitrates to furnish the basis of fertilizer for the entire of Europe. And that was not based merely upon casual observation but was based upon chemical analysis of the salts that are deposited in that area. Now there has been some experimentation along that line, but it has not been proven commercially successful up to the present time, but with transportation, and with the increasing need in the United States for fertilizer of that nature, it (1172) is entirely

probable that this area will be developed and will become a contributing factor to a railroad development.

Now, in this statement I don't want to be understood as
653 saying that I would claim now a single ton of freight for the cross-State railroad from that standpoint, but I do make this statement: That unless we have railroad transportation these potential resources of the State, or these actual resources of the State, will never be developed.

Q. Mr. Duncan, do the county courts of these three counties for which you speak, and do the people of these three counties, consider the construction of this cross-State line as a convenience or as an actual necessity to their proper development?

A. I desire to divide that area into two districts. I would say that as far as Harney County is concerned and the southern portion of Grant County, that they are 100 per cent of the opinion that the railroad is an absolute essential element—the cross-State railroad—in the development of our country, and it is not possible, under any circumstances, to develop our county without the construction of such a line.

Now, as to Malheur County, where they are developing the two extensive irrigation projects that have been referred to as the Owyhee and the Vale projects, while probably the necessity is not as imperative as it is with Harney County, still (1173) the people of that area feel that with the increased production that will come from these two projects and from that valley, that they will not have an equal chance with the producers in other more favorably situated irrigation projects unless the cross-State line is built so that they can get into the northern California markets. It must be borne in mind in that connection that the northern California markets are increasing very, very rapidly, and while it is true that the other western markets are also increasing, still the consumption power of northern
California is far in excess of the other northwestern
654 area and their home production is less. In other words, they are importing more of their foodstuffs than the other States.

The development of hard-surfaced highways, such as are contemplated in the Yellowstone cut-off and in other directions, through the interior part of the State of Oregon, would not make possible the development of the territory in that part of the State, for the products which Harney County in particular produces, nor would it materially assist in Malheur County. The distances are too great to practically haul the produce that we have to market by truck over even the best of highways, and we have no first-class highways even contemplated into our country. Our products are basically the heavy tonnage products, meat and wheat, and it (1174) is not practical to haul such products the distance that they would have to travel by truck. I would say that it would be a factor in the development of our country, in that it would facilitate the travel of persons, bring people through our country, and it would help in that

way, but as far as the actual development of the agricultural and livestock resources it would be a very, very minor factor. (1175).

Cross-examination:

Q. (By Mr. SPENCER) As I gather from your testimony, the present line from Ontario into Burns hasn't been of much assistance to your country there nor made much use of, is that right?

A. No, Mr. Spencer; I don't want to be understood in making the statement as broad as that. It has been of great assistance to us, but I would cite the statement that I made before, that prior
655 to the construction of your line from Crane to Burns, which was not made by the Union Pacific, however, we produced no wheat up there. Now we are shipping wheat. We have been producing a few acres of wheat there for years for home consumption, not for export, not for shipment.

Q. Well, you haven't produced any to speak of for export yet, have you?

A. Well, I think we have made a very, very substantial showing for the time that we have.

We can't produce wheat and ship it from Crane.

Q. Well, you have got a good highway, and have had for years! The best highway you have got is from Burns west to Crane and Ontario, isn't it? (1176.)

A. No; not from Crane to Ontario there is no highway. There is a good highway from Crane to Burns. It is 30 miles and has been there since 1922.

Q. Well, now, why couldn't you deliver wheat, if you raised it, at Crane before this extension was built up to Burns?

A. The trucking cost was too great. It can't be done successfully.

Q. Well, do you mean to say that if you can produce 50 or 60 bushels of wheat to the acre that you can't raise it profitably and truck it 30 miles and ship it to markets that pay over $1.00 a bushel?

A. They don't pay over $1.00 a bushel in our area, Mr. Spencer, and I would say this, that as far as the wheat that has been shipped from Burns, it hasn't proven highly satisfactory from a financial standpoint. It has been possible, but it isn't a very profitable proposition under those conditions.

There are flour mills, several of them, all along through
656 southern Idaho. There is one at Ogden. (1177.)

Q. And those are the destinations, except one or two cars where your wheat has gone?

A. No, I think not. I think most of our wheat has gone to Portland. Portland buyers have been in there. Now, I have no actual knowledge of where this wheat went to, but I know it has been bought through cooperation between the local warehouseman and the buyers at Portland.

We have a local warehouse at Burns—not a wheat warehouse—a general warehouse, and that warehouse handled all the wheat that went through Burns.

These southern Idaho mills and the Ogden mill get some of their wheat from southern Idaho, and I think they ship probably some wheat from the Dakotas and probably some from the Pendleton areas. I believe they ship wheat in from the Dakotas to those southern Idaho mills in limited quantities, for the purpose of blending their wheat; but the wheat that we grow from the irrigated areas of our section isn't particularly suited for milling purposes, unless it is blended with a hard wheat from some of the hard wheat producing areas. Now, where they get (1178) their hard wheat I don't know, but I do know that it is the policy of millers to blend their wheat in that manner.

There might be hard wheat grown in Idaho in limited areas, but not in irrigated areas. As to whether it is grown in large areas around American Falls and east of Minidoka, I am unable to answer. I don't know how much hard wheat is grown.

My opinion that wheat was sent from the Dakotas down to blend with southern Idaho wheat was merely from my knowledge of
657 the fact that it is necessary for the miller to make a high grade of flour that he have a hard wheat. Now, where he is going to get the closest supply of hard wheat I don't know, but my notion would be, from my general knowledge of the country, that he would probably go to the Dakotas. Now, I may be in error in that. I am not contending that I have any definite information.

I do not think it is necessary for the Portland and Astoria mills to go into the Dakotas to get wheat. They have the eastern Oregon and the eastern Washington, the Inland Empire, to draw from. (1179.)

Southern Idaho has a line by the Oregon Short Line up to Butte. Montana wheat is hard wheat. They probably get wheat from there.

Q. Now, over the years some of your livestock men in your territory in Harney Valley have been conspicuously successful, have they not?

A. Well, not in 10 years, but over a period of 30 years there have been some very large livestock industries built up in Harney County, but I would want to say that in the last 10 years those same industries have not been successful, and one of the largest of those plants is now out of the cattle producing business entirely; it hasn't a hoof. That is the Eastern Oregon Livestock Company, the former Blitzen Valley ranch.

Q. That is Swift?

A. Over 90,000 acres. Yes, sir. I represent that institution. (1180.) I have been associated with it for the last nine years. His operations were not just as favorable as Mr. Hanley's. The land is just as good, or compares very favorably—I won't say just
658 as good. I think Mr. Hanley's Bell-A ranch is the very cream of that entire country. His Double-O ranch represents a little different problem; it isn't quite the cream of the country, but it is a substantially different proposition.

Q. I thought you pointed to the Blitzen here as one of the finest layouts for an irrigation project that there was there.

A. I do.

Q. Now, Swift, in the operation of that, hasn't been successful over a period of 20 years. They have been in there pretty near 20 years, haven't they?

A. No, sir; they haven't; not quite that long. They did not buy with Corbett in there. (1181.) Mr. Corbett was in that operation long before the Swifts were. He was in that operation with Mr. Hanley prior to the time that the Swifts bought into the plant. The Swifts have been in there I think 13 years now, accurately, maybe 14. I have been there ever since the line was extended from Juntura to Crane. That was opened for operation into Crane in 1916. Swift has closed out, sold all his livestock. They sustained very heavy losses in their operation. During the same time, in the same country, Mr. Hanley has operated successfully. He has extensive holdings and large herds right now.

Q. Now, after all, management has a whole lot to do with success or failure in these enterprises, doesn't it? (1182.)

A. I think there is as much distinction between that operation as there would be between the operation of two factories turning out the same products; one might be of such a nature that it
659 couldn't profitably turn out a product, and the other turn out a product at a profit. Now, that is the condition that we have there, while they are in the same general country, they represent so many different elements that it is impossible to make a comparison from the standpoint which you attempt to draw. The fundamental, basic elements are practically the same if you limit that to purely fundamentals. They are substantially the same soil in the valleys, substantially the same elevation, substantially the same water, substantially the same white-faced cattle, and substantially the same feed.

Q. Now, what particular element was it that resulted in the failure of Swift and in the success of Hanley?

A. Well, Mr. Spencer, that would be a very long story, and I can probably give you just merely an insight (1183) into it, that's all. Mr. Hanley changed his method of operation and kept all his livestock in his own fields, within his own fence, produced his own hay, and kept his livestock down to that that he could handle under his own fences. The other plant during those years had a number of cattle that they couldn't maintain within their fences, and they were compelled to turn them out on the range. Now, those two factors alone are sufficient to the livestock man to explain a very wide difference. There is a difference in the crop, a difference in the quality of the meat that comes out, makes a difference in the market conditions. In other words, they didn't reduce the size of their operation at the time the deflation came and take care of the loss.

Q. In other words, Swift, when the inflation came, kept building up, and figured that the sky was the limit, and got caught in the

crash, and Hanley cleaned up and trimmed down his herd; isn't that right?

660 A. Well, that isn't far from a correct statement; yes. Now, the fact that there wasn't a cross-State line there didn't affect Swift's operations at all? He would have crashed just the same, as far as that operation is concerned, wouldn't he? (1184.)

We don't want it to happen again with the man that takes over these properties. We want to stabilize that proposition so it won't come about that way.

As to where these shipments of livestock from that country find destination markets, the sheep go east; the cattle go both west and east, the larger number going west. Considerable quantities of cattle go east, as feeder cattle; not as beef. The eastern markets require a better finished product in cattle for slaughter than do the western markets. They feed all that goes from our country. Nothing goes to the block from our country. They trim them up with corn.

Q. But the more profitable sales, in many instances, and over a considerable period, of your cattle production have been in (1185) the east, either in the Omaha, Kansas City, or Chicago markets, isn't that true?

A. I don't believe that to be true, Mr. Spencer. I would say some of our largest sales are made in that direction, but I wouldn't say the most profitable sales are made that way, because I believe that the most profitable sales are made in the Portland market to-day.

Q. Now, the large shippers out of that valley in the past years have been Swift's shipments and Mr. Hanley's, haven't they?

A. And the Pacific Livestock. The Pacific Livestock is a San Francisco institution and sends its stuff down there.

Q. And Mr. Swift and Mr. Hanley have shipped out largely to the east, haven't they?

661 A. No, sir; the Eastern Oregon Company which you refer to as the Swift Company has never shipped their own stuff. They sell it in Harney County to the highest bidder at the best price obtainable, and let the purchaser ship out where he pleases, and, as a matter of fact, when they were in production practically all of their stuff was sold to the Pacific Livestock Company and driven to Winnemucca, Nevada. From Harney Valley to Winnemucca, Nevada, is about 250 miles. (1186.)

Q. And they drive even farther than that, from up in Grant County, don't they?

A. Well, the Pacific Livestock Company begin their drives from the Blue Mountains, yes; 50 to 75 miles north of Burns, and drive right through to Winnemucca, or did. They have done that for many years. They did it even before the railroad reached Crane. Others have done it. The Eastern Oregon Livestock Company, in particular, in large numbers. (1187.)

Q. I thought you said they sold right there.

A. They do, but they sell for delivery at Winnemucca. They sell to the Miller & Lux, the Pacific Livestock, and did deliver their stuff themselves at their own expense at Winnemucca.

Q. Yes; at the same time that the Pacific Livestock were delivering some of theirs?

A. No; they would make separate drives out of them. They were going to the Pacific Livestock as a San Francisco operator.

Q. Now, is the stock arrived at San Francisco, after an operation of that kind, suitable for slaughter?

A. It doesn't, and that is the thing we are complaining about. It is impossible to get them there in condition for slaughter—it has to be fed there—whereas we have got the things in Harney
662 County that we can produce right now that will finish that stuff up, and with the cross-State line we can deliver it in San Francisco ready for slaughter, or Portland. We can't deliver it in Portland now in prime condition.

There was a difference, I said, of 150 miles in favor of the cross-State line from Harney County (1188); I would say from Crane. Now, Mr. Spencer, in making that estimate I don't have before me the figures as to mileage over your present route in connection with your Natron cut-off. It might vary just a few miles from the 150 that I mentioned, but it still puts us within a one-day run from Portland. We can't have that now.

Q. Well, would a mixed train operation across the cross-State line take you into Portland any quicker than the operation now from Crane to Portland via the Oregon-Washington Railroad & Navigation Company?

A. I imagine that delivery of livestock across that line would be slowed up so that there would be no advantage, but we don't ask for that and don't anticipate it.

Q. I don't say that it could be slowed up. I am asking you, would a mixed train operation, if the business was such as would justify no more service than a mixed train, would you reach Portland any quicker than you would now?

A. Well, it depends entirely on your service, Mr. Spencer. (1189.) When I say that I don't know what character of service you can afford to give us, but we will be in a distance where you can give us service and put us there in Portland in a one-day run. If you contemplate the same service that we get from Burns to Ontario across the desert that you refer to into a junction, we wouldn't save much in time, no, in reaching Portland.

Q. Now, suppose you ship 500 or 600 cars of cattle a year,
663 which is three or four times what you ship now, or three times, you know that a livestock special couldn't be operated across the State to justify that kind of an operation, could it?

A. Not and run it the year around, that is true, not from the products of Harney County. North Portland is the market now.

It has been the market for years of this Northwest, the buyers come in there from San Francisco and from Seattle and all over. That market opens up on Monday morning. The livestock special has to be in there the night (1190) before, the day before, so that the stuff may be exhibited and sold to advantage. That schedule is very important to the shipper, and is maintained with great consistency.

Q. Now, don't you, upon reflection, are you persuaded, that such service could not be maintained in an orderly, regular way, at fixed periods, across the cross-State line from the Harney Valley?

A. Mr. Spencer, if you will take present conditions I will say you are entirely right, but I can't possibly conceive that that condition is going to continue. Portland isn't always going to be the only market for that territory. The growers are going to assist themselves in developing a competitive market with San Francisco, and I am fully convinced that with the construction of this cross-State line that the movement of stock to a common point on the Natron cut-off is going to be in sufficient capacity to justify an expedited service, so that when they get to that point, even though the distance may be a little bit longer from southern Idaho points, still the additional cost will more than warrant them to reach that paint so that they can have competitive markets open to them of
664 both Portland and California. (1191.) Consistently the California market is the best market for cattle.

Q. Now, isn't it true that during the year 1927, and thus far in 1928, if the freight rate is taken into consideration, that must necessarily be applied on account of difference in distance, that the market at Portland is as strong or stronger than it is at San Francisco?

A. Oh, if you apply present freight rates on a shipment of cattle from Portland to San Francisco that may be true. I am taking and my statement applies only to the market quotations of the yard at the two points. The haul to Portland is 400 or 500 miles, and 800 or 900 miles down to San Francisco, I think. I don't have before me the cost and don't know the cost of a shipment of cattle from Portland to San Francisco. That is the reason (1192), Mr. Spencer, that we are not in the San Francisco market to-day, and that is what we are trying to reach.

Q. Now, you were speaking about this mill operation, and that the product of that mill should be credited to the proposed cross-State line. Now, you know that this line into Burns has been constructed for years, and has been a very constant loss in operation; that is generally recognized, isn't that true?

A. I would say that is true, and your line from Ontario to Crane has shown a constant and consistent loss since it has been built.

Q. Now, the line was extended from Crane to Burns in contemplation of this mill operation, wasn't it?

A. By the man that originally bought the timber, and then purchased from him by the Oregon-Washington Railroad & Navigation

Company, from him himself. I was there at the time, and I know that. (1193.)

665 I think it very safe to say, Mr. Spencer, if it hadn't been for Mr. Herrick's purchase of that timber in 1923 that your line would still be at Crane, and I say that without any disrespect to anybody in connection with your system.

The line was extended to Burns, and is now being operated by the Oregon Short Line, and it is a very fine service. We appreciate it. With that investment in there I think that that railroad should be entitled to that earning out of the mill, if it can get it.

Q. Well, then, what has the cross-State line got to do with that mill operation?

A. With the timber that will be contributed to this line, Mr. Spencer, I still question whether or not that line will show a profit. It may. I still don't think that it will show a profit, but I feel that anything, any tonnage, whether it be lumber or cattle or any other tonnage, that originates on the Ontario-Crane branch should be contributed as a factor to determine the advisability of this cross-State railway, and should be credited to that kind of an operation and not to your branch (1194) line operation that you have now.

As to the status of that mill operation, it has been sold, and the contract has been entered into by a very responsible timber man and the Government, and he agrees to begin cutting within, I believe, a period of 18 months.

As to the status of the present railroad up to Seneca and the mill that stands there half completed: The railroad is complete from Burns to Seneca; the rails are laid, and there is an operating

666 service over it. I was told by the manager of that road before I left that he had orders for 162 or 172 cars to deliver cattle and sheep out of that area, loading at Seneca, this year. I think that is probably a little in excess of his shipments last year. Those are all shipped under private contract. I think it is a common carrier. They are operating under an order from the Public Service Commission of Oregon as a common carrier, and (1195) the order is such that they are obligated to deliver at—or ship five cars or more up to, I think, January 1, of next year.

Q. All right. Now, do you know the conditions there, from a financial standpoint, of that road, or whether these purchasers are going to take it or the mill site? The whole thing is just a monument of failure, isn't it?

A. Well, Mr. Spencer, I know what you are driving at, but I am at a loss as to how to answer it. Mr. Herrick, who bought this timber from the Government in 1923, has met with difficulties. Now, I don't care to go into the question, although I believe I could answer it, as to what caused that and what brought it about. He has met financial reverse, and political reverse, and all kinds of reverses. But he did build a railroad into Bear Valley, and his line is now at Seneca, and I have gone over the line recently in your own cars, and

it is in first-class condition for a line of that type and it is operating and it is hauling freight. Now, the mill is about 50 per cent complete. I don't know that the present purchaser of the Government timber will ever use a foot of that rail line, or that he will use the mill that is now 50 per cent constructed, but if he doesn't he has got to put in the service that will give him the same result.

Q. Now, the fact is, however, that in an effort to develop agriculturally Harney Valley, the Oregon-Washington
667 Railroad (1196) & Navigation Company extended its line first from Juntura to Crane into the valley, isn't that true, and that was opened for operation 12 years ago?

A. Do you say for the purpose of developing that country agriculturally? I would say that was hardly a correct statement, Mr. Spencer. (1197.) I will say that still in 1916 they were headed across the State. The construction was stopped at Juntura in 1914. The decision of the Supreme Court was in 1912, as I remember it. The rehearing was denied in 1913. In any event they stopped at Juntura. The next year they extended it to Riverside and then stopped, and then the following year they extended it to Crane and then stopped, and in 1916 they got into Crane, and then they stopped for a good many years. After that there wasn't any development to speak of, and the population has actually shrunken, since that line was built up there. (1198.) Then they built into Burns under a contract with Mr. Herrick, wherein the Government was involved, for a mill operation that was agreed to be completed in April, 1925.

Q. And the railroad commenced its operation into Burns in December, 1924?

A. Well, they ran their first car in about that time. I don't think they established service quite that early, but then that is beside that point. The first car was in there and you all had a speech to make in September. Now—we are not in disagreement in this respect—we appreciate very much your service in that country as far as it has gone.

Q. But I am wondering whether your estimate of tonnage and the great growth that is going to take place in that territory, with the sugar-beet factories and the extensive shipments of grains, po-
668 tatoes, and alfalfa from the Harney, the Blitzen, and the Silver Creek Valleys, whether or not that is warranted from the past experience of this railroad during the last 14 or 15 years that it has operated into that country?

A. Well, considering that one element alone I would question whether or not—I would say probably your inference is correct, but I don't feel that that is the only element that can be taken into consideration in this matter, and that isn't the (1199) only element that I have considered at all.

Q. Now, you are not going to raise sugar beets and ship the sugar to San Francisco, are you?

A. We will ship it wherever the market justifies, if we can produce it. San Francisco is the distributing market for sugar. Salt Lake is another market for sugar. I won't ship any sugar.

Q. Well, in other words, if this had been a beet-sugar proposition attractive to the extent you indicate in your Exhibit No. 22, why hasn't it materialized during the last 12 years, while the railroad has been operated into that valley?

A. Well, I thought I explained that. My judgment is this, that the development of that sugar-beet industry is dependent entirely upon the development coordinating of the other agricultural products of the valley. We have got to develop other products along with that product. Now, it wouldn't be justifiable under any theory to build our irrigaton projects for the development of the
669 sugar-beet industry alone. We have got (1200) to develop our other products along with it, and they help support one another.

Now, on that score, another element which I mentioned yesterday is very essential to consider, and that is, up to the present time there has been no fuel supply that would justify the development of the sugar-beet industry, but with the coming of the sawmill industry we do have a source of cheap fuel supply available for that kind of an operation. That is for the purpose of developing power and heat. I think there have been some pretty big operations over there in the Boise-Payette Lumber Company in the manufacture of lumber. There is no sugar-beet production near the Boise-Payette. There isn't any, practically, in southern Idaho. The white fly has practically eliminated the sugar-beet production in southern Idaho. I understand the white fly has pursued the sugar beet all the way along through that area, in the raising fields in Utah, and it presents a very serious problem. (1201.)

I have considered the labor question.

Q. You know that during the last session of Congress the use of Maxican labor—there were bills introduced to prevent it through all of these areas that grow sugar beets?

A. I know there has been some political agitation along that line; yes, sir. And it extended and concerned the people engaged in growing sugar beets all the way from the Gulf to the coast. They were back there in Congress in opposition to this legislation and concerned about the destiny and future of their business. With that condition pending, with the fly pest, I think we should figure on sugar beets and the production of sugar as a resource for the cross-
State line. Just for the reason that I explained in my direct
670 examination, the Government entomologist who has made a very careful study of (1202) that situation reports it as being extremely favorable, and the cross-State line is going to help solve our labor problem, particularly in connection with that. Now, please, Mr. Spencer, don't misunderstand me as saying that it is my

judgment that this is bound to come about. It may not happen. I say that this is one of the possible developments of our county.

Q. Well, you put this Exhibit 22 in here as a tonnage resource for these gentlemen to reply upon in estimating whether or not a line could be sustained across central Oregon, did you?

A. As a contributing factor to that line; yes, sir. And I said in my direct testimony that this is a possible development.

Q. Now, this question of soil adaptability for the growing of sugar beets is not peculiar to the Harney Valley, is it?

A. If you will permit me to go into that, I would say that the sugar beet experts that we have had make tests and run analogies in our valley say that we have a soil condition that is superior to anything that they have found in Utah or southern Idaho. As to whether they found the same thing up in Ochoco, I couldn't answer as to that. I have understood that they did. But I don't know the gentlemen that made that statement. (1203.) There is no sugar beet factory up there, and Ochoco has been going for years, and had a railroad in there. But there are other elements in that community that answer that problem from another standpoint.

As to whether they found the same soil condition down in Klamath Basin I couldn't answer that. There is no sugar beet down there.

Q. You know that the sugar beet industry was established
671 at three different locations within the Yakima Valley within the last six years, and that all of them have been abandoned because of the labor problem?

A. Yes, that is correct; I have understood that, but I don't know the details of it, Mr. Spencer. I think in addition to the labor problem that they had a climatic problem that they couldn't overcome; it was too hot, during the summer months.

Q. Well, you engender some little heat up there in your basin yourself sometimes, don't you?

A. Similar to Portland. However, Mr. Spencer, not in the same way that you have in southwestern Idaho or in the Columbia Basin proper at a lower elevation. (1204.)

It gets much hotter in the Yakima Valley during the summer months than in the Harney Valley, and conditions aren't the same. Now, I don't want to say, because I don't know all the factors that made that matter a failure up there, if it is a failure, and I assume from your statement that it is. I didn't make an investigation as to the Yakima country, but I did as to others.

As to Grants Pass and the Rogue Valley, I don't know what the condition is down there, because there is no production down there and I didn't make that investigation. There was a factory built and taken out and abandoned, but they have an entirely different climatic condition in that area, not comparable to ours at all. I don't know who made the study before they went in there, or anything about that. A good many years ago they had a factory in the

Grande Ronde Valley at La Grande, and failed (1205), and they pulled that out. And they raise a good beet there. (1206.) But I will say this: That the sugar beet men have learned a great deal since they put that plant in at La Grande. There were men
672 there that attempted single handed to put in 160 acres of beets and handle it, and you know that is not possible.

Q. They abandoned operations at Nampa, Idaho? They had one there right near you, didn't they?

A. Right close to us. I remember the operation there in that valley at the time it took place, and the climatic condition was one of the factors that made that impossible to handle it in southwestern Idaho.

Q. And with that experience you have got 205,000 tons a year of sugar beet tonnage for this cross-State line in your Exhibit 22?

A. As a possible development; yes, sir.

This livestock is driven from way north of the Harney Valley down to Winnemucca. (1207.)

The livestock business was good in 1907. I wasn't in Harney County, however, at that time; I was in Malheur County. It was generally pretty good at that time. I was engaged in the livestock business in 1905, and from that time it was pretty profitable until 1914. (1208.) It has not prospered as well since the railroad was in there as it did before, but the railroad is not to blame for that in the least. And the railroad can't remedy it.

There are approximately 62,000 acres available for water from the Silvies River for the Harney Valley irrigation district.

Q. I misunderstood you. I thought it was 87,000. That is the figure that Mr. Newell gives here, I see, in his report of 1926. That is about right?

A. No; I didn't use that figure. I gave only the present area actually under irrigation and that has now adjudicated
673 water rights. I did make the statement, however, that in my judgment with the storage of water that that is going to be greatly increased, to not less than 100,000 acres, from the Silvies River and its tributaries.

Q. Do you know what the annual run-off and discharge of the (1209) Silvies River has been since 1904 to and including 1925?

A. Yes, sir; I know. I have been working with that for years, and while I don't have the figures before me I have a very general knowledge as to what those figures are. Our study shows that we can divert and make an annual use by storage of 115,000 acre-feet without any shortage. Now that does contemplate the carry-over in reservoir from year to year of a quantity of water to equalize that flow.

I have seen the report and study of R. J. Newell, an engineer of the Reclamation Service. I have read it very carefully, and with a very great deal of interest. I helped to secure some of the data

that is contained in that report, working with Mr. Newell; I assisted him, I should say; and I helped in bringing about that study by the Reclamation Service. That is the original, procured from Mr. Newell in Denver.

Q. Now do you agree with the conclusion here stated in his (1210) report of November, 1926, "The engineering features of the Harney project comprise the construction of Silvies Canyon reservoir to a capacity of 150,000 acre-feet for a practically complete control of Silvies River's waters; the construction of an efficient irrigation system to irrigate 65,000 acres of land, for which the run-off of Silvies River is sufficient, and the construction of drainage at a total estimated cost of $67.50 per acre." Do you agree with that?

A. Entirely so; based upon the Government figures. But
674 independent of that, Mr. Spencer, as I stated yesterday, we have spent $80,000 of the district's money in making a study through private sources of the same problem, and our engineers reach a slightly different result. They both agree upon the feasibility of the proposition, but the Government estimates of cost are not the same as the estimates of cost of a private project. The Government bases its figures upon an entirely different class of construction and construction under Government supervision is more expensive, I think it is generally agreed, than it would be under private construction. I don't agree with those figures as being a correct estimate of the cost of that district; no, sir.

Q. Is this true in this report: "That outside of the district the Oregon and Western Colonization Company owns every other section, the balance being held in small tracts by non-residents, many of whom homesteaded the land and tried to dry (1211) farm it but failed"; is that true?

A. Well, in a general way it is true. The Oregon Western Colonization Company bought the balance of a road grant that goes through that county, and the road grant had alternate sections, every odd-numbered section, for a distance of three miles on each side of the road; that makes a tract six miles wide through the country; but there has been a large amount of that, and all of that virtually in the irrigated area, has been sold, and they do not own it. They do still own the unprofitable lands out in the dry area.

Q. Is this correct regarding precipitation: "Precipitation in this section is light, averaging about 8 inches per annum during the past 10 years, which is not sufficient for successful dry farming"?

A. That is absolutely correct, we are sorry to say.

675 Q. Well, it is a condition there that I understood you were advocating, the dry farming operations there?

A. Mr. Spencer, I definitely stated that I did not advocate it. And did not say that there would be any tonnage to the railroad that should be figured in at this time as a possible asset to a cross-State line. But I do say that it is a possible development, and I do not

feel, in the light of all we know, that the precipitation records for the last 10 years represent (1212) a fair average of precipitation throughout the area over a period of 50 years.

For my average estimate for alfalfa per acre I use three tons in this report. Our average yield is in excess of that.

Q. How could more than 65,000 acres be watered from the Silvies and its tributaries with the present adjudications that have been made? The Supreme Court have held, have they not—you were in that case?

A. Yes.

Q. That the duty of water there should be three acre feet until November, 1929, when it will run for a test period on two acre feet; is that right?

A. Yes, sir.

Q. Now, with your annual run-off and discharge of 130,000 feet average per year for a period of over 20 years, taking into consideration your evaporation and your loss in transmission and in placing it on the land, how can you hope to irrigate more than 65,000 acres under that drainage?

A. Due to this condition, Mr. Spencer, we have, in that county, fortunately, had a branch experimental station that has been operating a good many years, and they have carried on very extensive experiments in recent years as to the duty of water (1213),
676 and they have produced crops of grain and alfalfa, sun flowers and other heavy yielding crops, and kept a very careful measurement of the water that has gone onto those crops. With that information before us, with the experience that the farmers themselves have had confirming the results of the experimental station, we have found that we can use a much higher duty of water than was allowed by the engineers. It is true the constituted authority has fixed and given them the right to two acre feet. However, when the irrigation disrict is in operation these rights all merge in the irrigation district, and then the irrigation district is the distributing factor and it virtually does away with your adjudicated water rights. There is a settlement between the land owner and the irrigation district, and his rights are no longer individual rights but merge into the district.

Q. Now you would not expect the farmers generally to operate with the same degree of success that Mr. Shattuck operates this experimental station over there, would you?

A. Well, that involves more history of our country. When the experimental station was established, Mr. Spencer, it was deliberately put upon the poorest quality and the poorest piece of land in Harney County, or in that area of Harney County, I will say, in the north area of Harney County, for the purpose of seeing what could be done with our poorer types (1214) of soil, because our better types of soil had been very well developed. I will say this definitely, that from my absolute knowledge of records made, tak-

ing the thresher measurement from field after field, and from considerable areas, that we as an average exceed the results obtained by Mr. Shattuck on the experimental station. Now I refer,
677 when I say "we," not only to Harney Valley itself but to the Blitzen Valley south of the lake a distance of 70 miles—60 miles away from the experimental station.

Redirect examination:

Q. (By Mr. McCULLOCH.) Mr. Duncan, if the cross-State line were constructed, such cattle as went west to Portland or Puget Sound markets on the north or to California markets on the south would be of what type? Would they be feeder or fat beef cattle?

A. In large quantity they would be fat beef cattle, fattened on our own products. With the development of our irrigation projects we are going to have a surplus of chopped feed that can go into the development of the finished product, and we will put our beef and our mutton and our hogs as well into (1215) these markets ready for slaughter, are not as feeders. If the cattle from Harney County should be shipped east they would still be heavy feeders. They would be a better quality of feeders than we have now, providing we give them a good feed on our own lots and then they are sent east under what we term heavy feeders. Now they are all classified as light feeders. They would not arrive in the eastern market ready for slaughter. The quality of beef delivered in the eastern market, as I understand it, demands a better grade than we could get there.

The purchaser of the tract of 890,000,000 feet of pine timber in northern Harney County from the Federal Government is Edward F. Hines Lumber Company, of Chicago. They are a very large firm and a very responsible firm.

Mr. McCULLOCH. I think that possibly I should make another explanation that would be of assistance to the examiner in this matter. The Eastern Oregon Livestock Company, which has been referred to by Mr. Spencer as the Swift interests, own at the
678 present time 140,000 acres of land in our county, of which 90,000 acres roughly is under irrigation at the present time. Now they have formerly been in the livestock (1216) business, and their cattle generally was sold to the Pacific Livestock Company and in conjunction with the Pacific Livestock Company's cattle their movement was to Winnemucca and thence to the San Francisco Bay points. The Eastern Oregon Livestock Company has ceased the production of range cattle and beef. They are selling their lands. Now they are offering their lands for sale, I will say, and we are making every possible effort to sell that land rather than to restock it. We have placed quite a number of people on that property and will subdivide it in any acreage that is desirable. The Pacific Livestock Company at the same time are selling off their properties. When these shipments were being made from our cattle into Winnemucca, they were large owners of lands in Nevada. All of their

ranches in Nevada, except one, have been sold. They have sold a number of their Oregon properties and their lands are being cut down and are being put into the hands of the smaller livestock men, and those large shipments are not going to continue from our area by trailing them across to the Winnemucca point. Now I call attention to that for the reason that it is important to consider, because the small livestock man who is taking up these ranches and making individual operations out of them will not make the same shipment. He must look for a shorter and more direct market for his product, because he (1217) can not afford, from the standpoint of cost, to take a small bunch of cattle that long distance, and buy feed and deliver them, because the cost is too great. It costs almost as much to deliver a couple of hundred head as it does to deliver
679 2,000 head. The difference is slight. So that the movement from the small producer must be in that direction, and his output and his market outlook both depend upon some other method of getting his product to market. If there is no relief by the cross-State line shipments will increase from Burns and Crane as a result of that condition. It is 30 miles between Crane and Burns.

The extension was constructed during the years 1923 and '24 and put in operation shortly following that. It was constructed to take the timber out from Burns through the purchase of this same Bear Valley tract I have mentioned by Mr. Fred Herrick. Approximately 30 cars a day were contemplated at that time from the mill. (1218.) The estimated cut is 75,000,000. I probably should make a statement about that. Mr. Herrick's contract called for an annual cut, average cut, of 50,000,000 feet of Government timber, but in addition to that Mr. Herrick had in private ownership a considerable acreage and a large stand of yellow pine, and the capacity of his mill, instead of being 50,000,000 feet, was 75,000,000 feet. That computation was based upon a 75,000,000 foot production. If his cut was 50,000,000 feet of Government timber alone, the daily shipments would be about 20 cars.

Mr. McCULLOCH. Mr. Examiner, the annual number of cars on a 50,000,000 foot production, at the rate of 25,000 feet a car, which is average, would be 2,000. 2,000 cars would represent the annual movement of a production of 50,000,000 feet.

Exam. ROGERS. What I was getting at was when the application was made for a certificate of public convenience and necessity the prospective traffic which the carrier had before it when it built this 30 miles.

The WITNESS. Well, there were no other elements consid-
680 ered (1219) for that extension except to secure this timber tonnage.

I do not know what the construction cost for the 30 miles. I know in a general way what the construction cost up to Bear Valley, 50 miles of it. I am not even accurate on that.

Recross-examination:

Q. (By Mr. SPENCER.) You state, Mr. Duncan, that you figure 30 cars a day roughly. Now for 300 days that would be 9,000 cars a year. At 25,000 feet to the car, which is the average loading in a box car of pine lumber, you would have 225,000,000 feet a year.

A. Well, then, I am in error, Mr. Spencer. I made that statement hurriedly without making the computation. What I wanted to give and what I did give was the total figures without reducing them to carloads. It just ran through my mind it was 30 cars a day. I may have been in error about that. But the total tonnage I am positive of. On that basis the cars produced would be about one-fourth of 30 per day. (1220.)

The elevation at Drewsey is about 3,500 feet. It is on the Malheur River and has a drainage outlet to the sea as distinguished from the rest of our county. It is the only part of our county where the drainage is into a flowing stream which reaches the main streams to the ocean.

Exam ROGERS. Just one question. Are we straight now, that the justification for this 30 miles was prospective traffic of about one-fourth of 30 cars per day? Is that what you want to say?

A. Well, I would not want to put it in carloads, Mr. Examiner. I will say that the justification of that railroad was to reach a cut estimated at 50,000,000 feet of Government timber annually, and in excess of that a considerable cut of privately owned timber,
681 which would be approximately 25,000,000 feet a year. Now I haven't reduced that to carloads. I would be glad to do it, but I would not want to be accurate in making the statement without doing it carefully.

Mr. SPENCER. It will be agreeable to us, Mr. Examiner, to have the application to the Interstate Commerce Commission for this certificate of convenience and necessity and the traffic (1221) showing introduced in evidence, if counsel want it that way.

Of course we are in there with this extension from Crane to Burns running right through the heart of your prospective irrigation district. It does run right through the Harney Valley, doesn't it?

A. Yes; it reaches it as well as any railroad could, Mr. Spencer.

Comr. MCMANAMY. Wouldn't it be sufficient to have a stipulation made that we could refer to that application for certificate of convenience and necessity?

Mr. SPENCER. Yes. (1222.)

Q. (By Mr. SPENCER.) I wanted to ask now if they can get an operation started at Burns of this timber from the Bear Valley, and this Government unit, why, there is another operation possible from the eastern part of the Ochoco that would come right in there, isn't there?

A. Yes, sir.

Q. And those possibilities have obtained there since the line was built—that is, that last 12 years, since the line was built into Crane? That is, the timber has been there?

A. The physical conditions have not changed any in that time. The difficulty has been in getting them blocked out and getting capital interested to go in there with an initial operation.

682 That is influenced by many considerations, too.

Q. You don't anticipate that your lumber operations are going to continue with only this one mill of 60 or 70 or 75 thousand capacity, do you?

A. Well, your assumption of capacity is not quite correct. (1223.)

Q. Mr. Duncan knows the conditions up there and I wanted to ask him whether the possibility for increased operation is not present; I mean, another mill alongside of this one they have got there?

A. Sure it is, Mr. Spencer. There are two hot springs in there, that the mill pond is to be fed from. There are other locations where there is a possible development, aside from Burns. At Burns that is the location for a milling operation. The possibility is there of a concentration in development like Bend, but not as extensive as at Bend, I would say. (1224.)

H. H. COREY was thereupon recalled and, having been previously sworn, testified as follows:

Direct examination:

The Malheur Railroad Co. built and operates the line of railroad extending from Burns to Seneca. That railroad company files tariffs with the Public Service Commission of Oregon. It makes annual reports to the Public Service Commission of Oregon under the State law. It is in no different classification with respect to a common-carrier status than the O.-W. R. & N., Southern (1225) Pacific, or any other railroad filing tariffs and making reports to the Public Service Commission of Oregon.

683 Exam. ROGERS. Before we get any further away from it, let the record show that the application which was by agreement given reference to just before recess, was I. & S. Docket 3339, reported at 86 I. C. C. 264.

The WITNESS. That pertains to the railroad from Crane to Burns. I am speaking of the road north from Burns to Seneca.

As to the provisions of the laws of Oregon relating to the transportation of livestock within the State—the statute provides that "Whenever there shall be tendered at any station for shipment over any railroad, livestock to the amount of 10 carloads or more, or when the total number of cars of livestock on any train shall be 10 or more cars owned by one or more shippers, destined for delivery at a common destination or point of connection with another railroad or carrier, it shall be the duty of the railroad to (1226) transport such shipment of livestock over its line from the point where received to the point of destination or delivery to a connecting carrier, as the

case may be, at an average rate of speed not less than 13 miles per hour." That is section 5932 of the Oregon Laws.

R. W. Cozad was thereupon produced as a witness on behalf of complainants, and, having been duly sworn, testified as follows:

Direct examination:

I reside at Burns, Oregon. I am engaged in farming and stock raising. I have been engaged in that business in Burns for 11 years, in Harney County. Prior to that time I lived in Grant County (1227) and was engaged in the stock business. I am familiar with the agricultural development of Harney County, particularly
684 in the vicinity of Burns. A part of my place is irrigated and part of it is dry. My irrigated land I am watering the last year or two with a pump, pumping from a well. The depth of that well is 60 feet. The water raises to within about eight feet of the surface and our pull down is to about 28 to 30 feet. Including ditching and leveling as far as I have gone with this tract the total investment in my pumping plant is approximately $2,500. That includes the cost of my well and the power for lifting the water, and the pump. (1228.)

Q. If the evidence in this case shows that the cost of the well at the experimental station in Harney County, Oregon, is $3,500, how do you account for the difference between the cost of your well and that of the State's well?

A. Well, our equipment is hardly the same, and a greater part of our own work we did ourselves, or I did myself. I did my own work in putting it in. My equipment is sufficient, but not as complete as the station's. My plant is sufficient for all purposes that I am using it for.

Under the irrigation system I grow chiefly wheat and alfalfa for hay. I have 160 acres in wheat. The average yield of wheat per acre from my irrigated lands is 50 or 55 bushels. (1229.) That is from the entire acreage. I observe what other farmers are producing in the vicinity in which I live. All of them thresh about 50 bushels of wheat on the irrigated ground. The fair average of wheat from the irrigated lands in the Harney Valley project is 50 bushels. The average of barley produced in these same fields is 55, or probably a little more. The fair average of the production of alfalfa is three to three and a half tons. I have about 200 acres in alfalfa. That is producing three tons to the acre. Other people raising alfalfa in that vicinity have about the same field produc-
685 tion. (1230.) That is on considerable areas. Grown on large tracts.

As to why there has not been a greater acreage in alfalfa in Harney County, particularly under the Harney Valley project, there has been no market for a lot of that kind of hay. It has been an overflow system on a part of it until lately, when they started control, and there is very few pumping plants under operation at the

present time. I think there are three pumping plants there in operation. They have been put in within the last two or three years. The overflow, irrigated land in that county could not be used for the production of alfalfa hay under present conditions. The water is not controlled and alfalfa won't stand that overflow. (1231.) With a storage system developed that land would be suitable for the growth of alfalfa, and grain crops.

I have had experience in feeding cattle and shipping finished cattle to the market. I have fed from three to eight loads of beef and finished them every winter there on the crops I have raised, on the wheat and alfalfa. I feed them alfalfa and chopped wheat and barley. I market all of those cattle at Portland. In reaching the Portland market our shrinkage has been more than it should have been, I think. The shrinkage is about 60 pounds I think on 1,050 pound steer or 1,100-pound steer. That shrinkage is—any weight we take at home is after a drive without feed or water, or four per cent shrinkage (1232) at home when we sell, and this other shrinkage is on top of that. For instance, if we sell at home our drive is considered to be eight miles without feed or water, or if you are weighing off of a feed lot, a four per cent shrinkage at home. The shrinkage on board the cars is 60 pounds in addition to that. That is practically 6 per cent on the animal we ship to Portland.

686 The buyer, when he is buying cattle in Harney County takes an arbitrary shrinkage by agreement with the grower at the point where the cattle is delivered of four per cent. Then any shrinkage in shipment is in addition to that (1233) amount of shrink.

These cattle we are fattening reach the Portland market in a satisfactory condition other than the shrink. There is no depreciation in their quality from the time they leave the county until they reach the market at Portland that I know of.

As to what benefits would accrue to the stock grower in Harney County by reason of the construction of the cross-State line to a junction with the present constructed Natron cut-off, it would give us an access to the California markets, which is pretty near impossible from where we are now. I have never myself shipped any cattle to California. It has been too far. As to whether the quality of cattle I have been shipping would be ready for slaughter if I had shipped by the existing lines in to the San Francisco market, I have never tried it, but I have understood they would not be. (1234.) With the construction of the cross-State line the shippers and everybody tell me that we would be able to reach the San Francisco market with those cattle in good condition. Cattle buyers from California are coming into our county and purchasing the livestock of the small growers in that county. I suppose to reach the California market they would be shipped by train around by Ontario, or overland drive south. I don't know whether any have been driven out of the county by California purchasers this year, but they have been the last few years. I think some were last year.

I think the construction of the cross-State line would bring more competitive buyers from the California market into our community. It would open up both markets on a competitive basis. (1235.)

687 It would enable us to ship to the best market at the time.

The feeding and fattening of livestock on hay and grain in Harney County could be extended. It is not being utilized at the present time to its fullest capacity. Very little is hardly touched. It is a suitable climate and is producing a suitable feed for the purpose of fattening animals ready for slaughter. Climatic conditions are very good. It is high and dry. Conditions are good for feeding. In my judgment that could be extended and expanded extensively.

Irrigation from my well has proven successful. (1236.) The whole neighborhood is contemplating that kind of a system for all the land that is not under the irrigation system. That will bring into irrigation an area other than the present irrigated lands, and will add to the irrigated area of Harney County. I am now irrigating about 60 acres at the present time from that source. There are 400 acres under my well and I contemplate irrigating 80 acres from this one well. I think the average unit per pumping plant through that area will be about 80 acres.

Q. (By Mr. McCulloch.) Mr. Cozad, if this cross-State line were built it would shorten your distance to the Portland market 148 miles. In your judgment would that be a substantial benefit, that shortening of distance in getting your beef cattle to the Portland market?

A. Yes; it would. We feed on the road from Burns now at Huntington. We can't make the run in one without a feed and stop. (1237.)

688 Cross-examination:

I ship from Burns. I have shipped from Crane before the line was built to Burns. I range in pastures inside, not in the mountains. I have no Government range allotted to me. I have a small herd of steers, 150 head on hand at the present time.

J. C. Cecil was thereupon produced as a witness on behalf of complainants, and, having been duly sworn, testified as follows:

Direct examination:

I reside at Suntex, Harney County, Oregon. (1238.) That is on Silver Creek. It is in what has been referred to in this case as the Silver Creek district. That district is about 28 miles west of Burns.

I am engaged in the livestock business. I was born at that business. All my life, you might say. I am 43. That time has been spent entirely in Harney County. I operate in conjunction with my father. I own other properties than the upper Silver Creek Valley in the lower, in what has been referred to as the Warm Springs. That is 30 miles from my main ranch. (1239.) My

father and I run in that country from 1,000 to 1,400 or 1,500 cattle. They range in forest reserves and around on the border of the desert, Government land. We market our cattle at various places. We usually sell them to local buyers. Buyers come in and we deliver them, one perhaps at Prineville, Lakeview, Silver Lake—in most any direction—Burns. It is 100 miles to Prineville, and about the same distance either to Silver Lake or Lakeview.

The proposed cross-State line would enable the purchaser of our cattle to take them out better and perhaps it would reflect
689 in that way. We have never shipped ourselves. We deliver them to buyers that do ship out or take them out. (1240.) We depend on a local sale of our stock. If the cross-State line is built the bulk of our cattle have come west and south. That has been the way they have been going. They have been driven overland. With the construction of this railroad they would be shipped.

I produce some alfalfa in my country. I am in an irrigated area. We are new in the alfalfa game. We have had about three or four years experience. We have been getting from three to four tons per acre. That is of cured hay in the stack.

Q. Now, Mr. Cecil, there has been considerable reference in (1241) the testimony in this case to a so-called High Desert in central Oregon. Are you familiar with that country which we generally call central Oregon, extending westward from the property you have described to the Cascade Mountains?

A. Yes. I have had occasion to operate in that desert. I am very familiar with the use that desert has been put to in the past. It has been used for winter grazing. To a certain extent it is so used at the present time, but not to its fullest capacity. The construction of a cross-State line would assist in the utilization of the feed that is grown on that area. The feed would be more completely utilized. It would increase the number of livestock and sheep that go out there annually for grazing. (1242.)

Under present conditions of the high price of livestock feed in particular, owners and bankers no longer care to take the risks that are assumed in going out on the desert. About on an average of two out of 10 years there are bad winters that will collect a toll of from 20 to 90 per cent of the sheep that go out. In other words, they are snowed in and lost, or perish. With a transportation
690 road east and west across the State it would be possible to put emergency supplies of feed at strategic points and the livestock could be moved to this feed and then they could be either shipped out or additional feed taken to the desert. Such a condition would undoubtedly result in repopulating that desert with livestock.

That desert produces a native grass and more or less browse. The production of that area is practically the same as the Harney County line east of our properties.

Q. And the only factor that has prevented its use to the fullest capacity has been the lack of water?

A. It makes it impossible to graze during the summer months on account of the lack of water.

There are some wells out in that area. (1243.) I have personally run some stock out on the desert area that has been mentioned. We have ranged livestock on the desert for a great many years. In 1925 or '26 we moved out on the desert with a 1,000 head of cattle, watered them from a well for four months. We pumped their water supply. That operation was practical.

With the construction of an east and west line across that county, it is my judgment that the country will be developed then for the production of livestock, both sheep and cattle, in excess of its present production. It produces an equal quality of livestock with the other grazing sections of eastern Oregon. It is the same proposition. (1244.)

Suntex is a little north and west of Riley. You see, we move our post office around every once in a while.

Q. Do you have at Suntex wells in addition to the waters of Silver Creek for your domestic supply water and cattle, or do you depend on the waters of Silver Creek altogether?

A. We depend upon the water of Silver Creek at the ranch,
691 if that is what you refer to. Wells have been drilled in the vicinity of Suntex to produce water for domestic purposes. Across this country that I have spoken of wells have been drilled to provide water for cattle and human consumption in various places that I have observed. With such wells to provide water for human consumption and for cattle, and a cross-State railroad to move cattle and sheep out and to bring feed in, it is my judgment that that country would support an extensive livestock industry. (1245.)

My place lies west of Burns, in Harney County. Suntex, right on the west line of Harney County. For years it was called Riley.

That so-called High Desert area is very rank in places. It varies. We find everything from small brush to heavy brush. There are large areas where the sagebrush is extremely large. On that type of ground I have understood it is an indication of the fertility of the soil. I don't know anything about it, though, from personal experience—the soil conditions. (1246.)

We ranged horses for a great many years, horses and mules, from a point probably 10 or 15 miles south of Bend, clear through to Lakeview, Silver Lake, all over the entire desert, a radius south and west of 75 miles from the ranch. My testimony with reference to the possibility of utilizing the area applied to this entire desert area. (1247.)

Cross-examination:

We use the desert for the winter range. Up until the last two years we have been running a percentage of our cattle on the desert, a various length of time; we start in with the bulk of them on, and we go to pulling them off, say, by the middle of December the

winter starts, we will say, and then we go to taking those off the desert. It would depend upon the weather. Some of them
692 would stay practically all winter. The average year we have perhaps the bulk of our cattle in by the middle of January or first of February. We put them out first about the latter part of October, usually, the first of November. We are in striking distance from the ranch, on Silver Creek. That is above Riley (1248), or Suntex as it is called now. I mean by striking distance it is about 25 miles to the border of the desert from the ranches there, from the Buck Creek side, we will say, and we move over onto the Buck Creek side with our outfit and we can cover this territory from there.

Q. Oh, you operate two ranches—one up on the desert, and one on the Silver Creek proper?

A. Well, we have a camp over on the desert in the fall of the year.

Q. But you mentioned two ranches, one up above Suntex, and the other one down——

A. Above the Double-O, in what we call the Warm Springs district. They are 30 miles apart. We operate both of them from one headquarters. The headquarters is on upper ranch, upper Silver Creek, Suntex. (1249.)

In the summer we range them in the national forest. That is north of upper Silver Creek. It is six miles to the reserve boundary. We pasture them in the reserve. That right is obtained by a method they call allotment. They allow so many acres to you in the reserve on the basis of the herd that you carry. They limit the number that you can pasture per acre. That reserve is pretty well taken up.

Q. And you have got to have enough summer range in the reserve to take care of the livestock that you use or feed on the desert in the winter, haven't you?

693 A. Well, not necessarily in the reserve, because there is a certain amount of territory adjacent to the reserve that (1250) could be used for either spring, fall, winter, summer, or any other grazing. It is Government land. It isn't allotted. It is unappropriated Government land. You just simply move on and feed, turn the stuff loose. That is pretty well grazed now. At times the storms on the desert are pretty severe. Snow storms. As to the usual snowfall there, I would say there will be winters—now, a winter like last winter, two inches was probably the maximum depth, the most of the desert, and the snow went off so quickly that there probably was a lack of snow, there wasn't sufficient water for camp purposes and for sheep; and then there will be a maximum depth of possibly three or four feet (1251) that will come in 24 to 36 hours. Such storms in the winter are infrequent, as a rule. There probably won't be more than one heavy general storm in the winter.

The light snows go off quickly, within a few days after it falls. Heavy snows will probably last maybe two or three weeks.

The summer pasturage that is available is worked practically now to its capacity. We could increase it to this point, if by shifting, we will say, a definite number of livestock to the desert, we will say, for two months, then you have simply created two months' grazing, and to that extent it can be enlarged.

Q. Well, if you haven't got the summer range for them when (1252) you have to take them off the desert how are you going to take care of them?

A. We have the summer range, we would have the desert, and then we have the spring and fall range that could be used for—it could be held over. If we stay on the desert for two months, obviously there is less grass consumed on this land that is
694 adaptable to either spring or fall use, or it can be conserved, it can be used for summer. You see, we are right on the border there. The Government land is right around the reserve. We are not limited to any strict herd law. They permit a drift system. We are given an allotment, so many cattle, and then we have a drift system in vogue there, in and out, in and out of the reserve; part of the time they are in the reserve, and part of the time they are out of the reserve. The entire community operates as one over there. The feed in the margin of the reserve and in the reserve itself is exhausted with the coming of winter, largely.

Q. Whether you feed it or not?

A. Oh, no, no.

Q. Is it bunch grass?

A. Bunch grass. It can be held over. (1253.)

We can only feed so many herd of it under herd regulations with the Government.

Q. Well, you wouldn't feed any of it to excess, as far as that is concerned? You would destroy it if you did, wouldn't you?

A. That's the theory, yes, sir. We limit the number that we feed within the reserve or outside of the reserve.

Q. Well, there isn't any possibility of any great increase, then, is there?

A. Well, as I say, that increase—whatever grazing can be created, whatever—if it is possible to put 100,000 sheep on the desert
695 two months, why, you have created two months' grazing for 100,000 head of sheep. That is what it comes to.

Q. You run sheep and cattle both, don't you?

A. No, sir. (1254.) I mentioned sheep several times because I am quite familiar with sheep, because our neighbors, so many of them are in the sheep business.

We have ranged on the desert in the Christmas Lake Valley. We haven't had livestock on the desert for some time, and they were largely horses and mules. We did not range our cattle there as it was too far from our base. Men who live on the Silver Lake side naturally graze their cattle there, the GX people, and people around

Risley, and over on that side. (1255.) They usually, I believe, take them out of the mountains and put them onto the desert along in—it depends on the storms. We will say approximately the first of November. And then they take them off somewhere around the first of the year, I imagine; it varies with the season; depends on weather conditions absolutely.

Q. You talk about your driving and selling at Silver Lake. How do you happen to sell at Silver Lake? There is no transportation there, is there?

A. We trailed them to Silver Lake. We found a market at Silver Lake, residents. At Silver Lake they winter them and take them through the Klamath Marsh, and summered them at the Klamath Marsh, and that was their intention, to ship them out to San Francisco this fall. We had reference to Silver Lake in Lake County. (1256.)

Redirect examination:

Q. (By Mr. DUNCAN.) Mr. Cecil, do cattle reach the desert for grazing purposes from any districts other than your own, from Silver Creek?

696 A. Oh, yes. They come into the desert from all sides. The desert use isn't limited to the grazing facilities that exist within the vicinity of our ranches.

The dry bunch grass is first class food, I would say, for livestock. You couldn't compare it with grain. When I say first class, I mean as compared with any other forage. Compared very well with cured hay. (1257.)

Three years ago, I believe it was, I shipped some livestock from Burns to Crane. (1258.)

WILLIAM HANLEY was thereupon produced as a witness on behalf of complainants, and, having first been duly sworn, testified as follows:

Direct examination:

My headquarters are in Harney County. I generally go to the ranches in Harney to start some place else. I have always been a resident of Oregon.

Q. Well, how long have you taken an active interest in the development of Oregon, then, so that the record will show how long your activities have existed over this country that we talk about?

A. Well, probably seven years old. I have been in the livestock business and in the development of those kindred industries for a period of over 50 years in Oregon. I came into Harney County in '79 to develop my properties there. (1259.)

I own and operate in Harney County now probably 35,000 acres. Prior to coming to Harney County I operated in the Rogue River Valley, two miles below Jacksonville.

The development of the livestock industry in Oregon has been my business for life. In addition to that I have taken
697 interest in the development of the State of Oregon along about all lines.

Q. Have you examined the transportation problems and difficulties of Oregon, particularly, first, relating to the Central Oregon country?

A. The first trip that I went into central Oregon, my father was with me on top of the Cascade Mountains, and I didn't know just where I was going, and he knew something about the country, and he had been in the Klamath Falls earlier than that—he had been in the Klamath Falls, and I had been with him, and we looked over the Klamath Falls country and we looked at it as a grazed-out country at that time—and about the last mandate he gave me was to go until I found a big country and (1260) keep it in my mind I wouldn't get any bigger than the country I got into. He said, "Don't worry about transportation. It will come across the plains to get this timber." And that was the mandate that I went into the country on the transportation idea.

Q. Now, were you in the country, in the Harney country, prior to the construction of the railroads into Crane, into Lakeview, into Klamath Falls, and into Bend?

A. Oh, when I went into the country the Central Pacific was the only operating road. Winnemucca was our station. We took our first drive of cattle to Winnemucca; I think the first we took out of Harney County we took to Winnemucca. I was there prior to the construction of the Oregon Short Line; the Oregon Short Line came in in the first of the eighties.

In the course of my activities I became personally acquainted with some great figures in railroad development of the West. The earliest transportation that was pointed across the country was from
698 Yaquina Bay to Ontario. That was after the O. W. R. & N. had started under the heading of—well, I don't—(1261) Corvallis eastern, I think J. Eginton Hogg, and he didn't get farther than up on the Cascade Mountains—I don't just remember the place—and he held a right of way in the Malheur Canyon pretty well through the eighties; but it was always a constant rumor that somebody would take up the railroad and somebody would build a railroad. The first railroad that was—well, I sold out of the cattle business and came back to southern Oregon in '82, and then I was interested in—for a few years, in the building of the road from Roseburg to Ashland; then I came back again and was interested in the building of the other end of it, from Redding to Ashland.

Oregon has had a complete history of stub-line railroad building. Never in its history has it ever had a railroad that didn't go along to some point and, as we would call it, "keg up" all the way from 10 to 20 years—some of them "kegged up" yet—and then some

other idea would come along and move them on another piece. That has been the continuous history of Oregon.

I got interested that we would have one railroad to build right across the State, and Mr. C. E. S. Wood, E. Jofer, and Grimes of Coos Bay, and Addison Bennett—I think that was my main show company. I started out on Mr. C. E. S. Wood and converted him to the theory that Oregon never could develop without it had a cross-State railroad, and then give him my plan for building, and that there was no other railroads in (1262) the State except the Harriman lines, and we had definitely the information from Mr. Kruttschnitt that the country could wait, that it was bottled up, it took all the money that they could raise—which I think it did—to build lines in competitive territory on the O. W. R. & N.

699 Now, I will refer to the records as being the best proof. Then the legislature was assembled—before that we had been doing some campaigning through the State to build up a public sentiment for the cross-State line, but when the legislature met Mr. Wood and myself urged for a joint session, after they had organized and had their speaker and president of the senate which was given to us, and Mr. Wood addressed them, and then we introduced the resolution that they would have to pass to refer the modification of the constitution of the State of Oregon to issue bonds to build its own railroad across the State. This greatly wrecked a plan that the boys had organized to work under, to put such a measure through. There weren't much room in the newspapers for anything else, vice versa. I remember quite well Mr. Harvey Scott raving at the idea as being so socialistic, and that if it was just run by the balance of my company that he wouldn't feel so bad about it, but for me personally to introduce such a "damn socialistic idea" was more than the Oregonian could stand. Mr. Jackson, of the Oregon Journal, was just a little stronger on the other side, and all the State papers taken it up pro and con, and it was (1263) the whole working of the session of the legislature. Even my partners and friends have told me that was against me that if I went to Salem that I couldn't find my own bill, and I always managed to find it, and we got it passed before the legislature was over. That was, I would say, 1905 or 1906, but the record of that legislature will show.

That spring Mr. Hill got word to me that he wanted me to come back to St. Paul. I went back to St. Paul—of course I had met Mr. Hill a good many times before—and when I went into his

700 office he pulled out a drawer that he had full of these clippings and he laughed about it, he thought he would like to see somebody to stir the hair up on them; and he said, "You are doing a mighty good job to stir your State up." He said, "You are right; your State can't develop without it gets transportation, and you are not going to get transportation without you make a fuss about it." He said "If you can't build a railroad any other way than to get your State to sign your bonds it is the best thing for

your State to do, and the people of your State eventually will stay with you. But you don't have to do it that way. I will build your railroad for you." He said, "Harriman ain't been very good to me since we dissolved our merger; he kind of fell out with me. We were pretty good friends while he was starting in, but since we (1264) dissolved that he hasn't been a very good friend of mine. Then he went into Seattle. He knew that was my town. He knew that I went into Seattle when it was a little place, and Seattle has built up. I knew when Harriman wanted to come in that he would get in." He said, "You know, when you have been there with the people so long and they have got used to you they wouldn't keep nobody out because you wanted them out. So I really helped Harriman a little to get into Seattle. I didn't do it because I liked it, but I done it just to show Harriman that I wasn't a bad fellow. But I want to play him a return game, and I am coming up there into your country with you." Of course, I was very grateful to get a partner like that at that time, and that started the building of the line up the Deschutes; and when that start was made the Harriman lines commenced building up the Deschutes, and I met Mr. Billy Cotton in New York at the Waldorf, and he said to me that I ought to be satisfied now, that I had got trouble enough stirred up. "Well," I said, "Mr. Cotton, I am not satisfied.
701 You have got no right to take our central Oregon money and put it into Deschutes Canyon. You know you don't want a road up the Deschutes Canyon, and we are entitled to that money first to build a line east and west across the State." He said to me, "Will you go and tell Harriman that?" "Well," I said, "sure, (1265) I will be glad to tell Harriman that." I said, "He has got no right to spend the money on Oregon railroads in central Oregon in the Deschutes Canyon." I went down with Mr. Cotton, and we had a visit with Mr. Harriman, a very short visit. Mr. Harriman put the question up to Mr. Cotton, "Eventually won't you need the north and south line along there?", and Mr. Cotton said, "Yes; yes, I think probably we will." "Well," he said, "go ahead." That settled that.

Then we persuaded Mr. Hill to come up the Malheur River. The line there had been laying under survey and had been renewed under the Harriman line, the east and west line, had been renewed, and we persuaded Mr. Hill that he ought to have the right of way up the Malheur Canyon and take and build that road. And Mr. Hill agreed, and Mr. Wood and I went up and bought the whole bottom of the Malheur Canyon from above the Harper ranch to Riverside. We done it under the barrage of the State's plan. Everybody accepted that because they knew we were both crazy on this railroad. Nobody thought that Mr. Hill was interested in the Malheur Canyon. We went on through his instructions and projected a line up the Malheur River, that is, a survey for Hill, still under the State-aid line. Then they were getting pretty well up the Des-

chutes—now, I am not keeping definite track of the years; the records of this will just definitely give the time that all these things
(1266) happened. Mr. Hill, for some reason—I saw him back
702 in St. Paul, and that is when he told me that he had let Judge Lovett have the right of way up the Malheur River. He was very much an admirer of Judge Lovett. "Well," I said, "You made a mistake." "Oh, no," he said, "I didn't make no mistake." He said, "I got all that we need, and," he said, "Judge Lovett will build your road across the State."

Probably that season we commenced building the line up the Malheur River, a full standard line. I went down several times, talked about the conditions of building a line across the State. Built up to Juntura, and stopped there a little while as time goes on in Oregon, a year or two, then we got it started off again and built 20 miles more up to Riverside, and there we got hung up pretty good, four, or five, or six years. Mr. Farrell said, "I am going to lay down on my board and see if we can't get money enough to get on up to the Harney Valley." I told Mr. Farrell that I thought probably we could commence to work at some development there if we could get up into Harney Valley; and then Mr. Harrell notified me when he came back that they had the money, and they went ahead from Riverside and built it up into Harney Valley. At that time he told me, "You probably will have to wait a few years before you can get on across. The railroad conditions and the general conditions of the country looks like it will lay there; but," he said, "eventually they will build your line (1267) across."

So the next move that happened with it was the one when it turned north to Burns and to Bear Valley for the timber. I feel like I have been rather indulgent, and still fair. The war came on. Then, after the war and the readjustment, which has put the people in the country in pretty hard circumstances. No country for the past 10 years needs to talk about any kind of development.

Next time that I got interested in the line, I think, goes
703 back about four years ago, and that came out in the transfer of the Central Pacific to the Southern Pacific. This, from a country standpoint, is a real mistake. It should have never been turned over to the Southern Pacific. The Southern Pacific is a north and south line, and in the separation there could be no other base only a north and south line. The Union Pacific is an east and west line, and the base of any settlement of separating the two roads from the differences that there were in between the management of the Harriman couldn't fairly be under any other base. If a railroad holds a country it must be responsible to the country for service, and when you take a piece out of the center of it and turn it over to the other road there ain't no definite line, and the country itself has no place to charge up who ain't giving them service.

Now, we tried hard to keep the Central Pacific from being transferred to the Southern Pacific. After that was done, our (1268) Oregon tonnage was transferred to the Southern Pacific to originate it, which I don't quite understand how the people of Oregon can go to bed and sleep sound of nights with the originating of their tonnage promised noncompetitive with the Union Pacific under a contract of delivery at Ogden. And with me as representing the State of Oregon I think it is a very serious fight and condition with Oregon, if it is going to be forced onto it as a railroad, the promise under these agreements, which has had large sums of money spent on them, to come at this time and start to move this tonnage all south and junk all Oregon harbors and go off and leave an investment of $30,000,000 or $35,000,000 to be charged up against our rate structure as local lines. Under this contract to build the
704 east and west line across the State, which was from Coos Bay to Boise City, the gap has been closed in from Coos Bay to Eugene, and from Ontario, Oregon to Crane or Burns. This agreement with me representing the State of Oregon could be modified by any trade between the same system and the separation of the same system, with the division of the Oregon tonnage, if it was at the summit of the Cascade Mountains, on the Natron cut-off, and the cross-State line has a right to all the tonnage that there is in western Oregon under the heading and the agreements of its heritage. It is a question of controversy. The State of Oregon had b[illegible] do exactly the thing that it started out with in our original plan and amend its constitution (1269) and let its highway commission go and build an independent line between Crane, Oregon, and Odell, and start out with a pervasive political policy to see that they treat that investment right and treat this agreement right.

I would say that the construction of this east and west railroad that is petitioned for in this case is a great necessity for the development of the entire State of Oregon.

Exam. ROGERS. Won't you take this original plan a little further. What was the original plan when the Union Pacific started to build the Malheur Canyon? Where were they going?

A. Cross-State line.

Exam. ROGERS. What were they going to do over the Cascades?

A. Build the Natron cut-off. They were going to Coos Bay, or to the connection of the Southern Pacific. Of course, the Coos Bay line was agreed along in them years under construction. It went out of the way. (1270.)

Q. (By Mr. DUNCAN.) Now during all these years, Mr. Hanley, then, you have taken an active personal part in securing
705 the development of the State through the construction of these railroads, and going directly to the fountainhead, Mr. Hill and Mr. Harriman?

A. Well, I just kind of naturally fell in with the—contact with them, under the policy that I was following.

Mr. C. E. S. Wood, was the agent in Oregon for the owners of a vast road grant that traversed the State from east to west; from Ontario to the Willamette Valley. And his intersts, from that standpoint, he could speak for the owners of that grant, and did.

Q. Now, isn't it true, Mr. Hanley, that at the time of this original development and the construction of the line up the Deschutes Canyon and up the Malheur Canyon began, that the Union Pacific system and the present Southern Pacific system were all then under one management and not then unmerged?

A. No; they were all under one management. (1271.) The Southern Pacific and the Union Pacific was under the Harriman management. When they were under this single management the tonnage routed east was contemplated to move over that east and west line. That is the tonnage routed east of the place that it originated in, western Oregon. The routed south would go south

Mr. Harvey Scott was the editor and manager of the Portland Oregonian during those years.

Q. And Mr. Cotton, whom you have mentioned, Judge Lovett, and Mr. Farrell were all executive officers of the Southern Pacific Railway Company during those years? (1272.) Before they were unmerged.

A. Mr. Cotton was really the head of the Harriman system in Portland. I would check up on a little incident: Just about
706 that time that Cotton was assuming that position, he was really tendered, as I remember it, the appointment as a supreme judge, United States Supreme Judge, and it was a matter that Mr. Harriman settled but he didn't accept it. Judge Lovett and Mr. Farrell were also connected with Mr. Harriman through some of his operations. Lovett was a Texas man that Mr. Harriman took up to New York from Texas and developed into succeeding Mr. Harriman.

Q. Now, so that the record may not be misconstrued, Mr. Hanley, in your direct statement I believe you stated that you and Mr. Wood bought up the bottom of the Malheur Canyon for the purpose of a hill right of way. By that do you mean that you bought the bottom the entire distance, or just the seeded lands in the portion where the property was seeded and developed?

A. Well, we bought the seeded land and pretty well stripped the balance of it. We didn't acquire title to all of it, some of it being in Government land. (1273.)

Q. (By Mr. ELLIS.) Mr. Hanley, you spoke of the carriers investing some $30,000,000 or $35,000,000 which would now have to be charged up and maintained merely as branch lines under existing conditions. Just what do you have in mind when you mentioned that expenditure?

A. Well, I would have in mind the line from Ontario to Crane—the Burns line is built under a special agreement that isn't involved in that—the line from Eugene to Coos Bay, then the line up the

Deschutes, which, under existing conditions, can be nothing more than branch lines.

Comr. McMANAMY. Mr. Hanley, you have spent your life in the development of the State of Oregon, eastern, central, and western, and are probably as well informed concerning the conditions
707 there as any man in the State. Could you give me your views, for the benefit of the commission, as to what would have been the result of the construction of the cross-State line, say 20 or 25 years ago, in the way of developing that part of the State? What I am (1274) trying to get at is, would such a line have resulted in development similar to that in the State of Washington east of the Cascades, and any other thoughts that you may have in connection with the probable results of the construction of such a line?

A. Well, Mr. McManamy, it leads on into so many different angles. One of the unfortunate conditions of what I call my own country, south of the Blue Mountains and east of the Cascades, that with the barrier of the Cascade Mountains, when the first emigrants came into the country, they were having what they thought was such a struggle coming in, which was mostly caused by being house-raised people to start in to cross the plains. Us fellows that went back onto the plains found it a beautiful place to live in. But those people who lived down here on the west side, they had all the shade and all the luxuries of life, no question about water, but we were completely disconnected with them until that barrier was broke down, there was no understanding. The fellow in the Willamette Valley, if he was going to the mountains, why, he didn't know enough to start to the mountains except to start up on the Cascade Mountains—he didn't know that he was going east and going up to where the world opened up; he had a complete idea that he was going into the mountains and that he would get lost in them—if he started back down again, he didn't know how to get (1275) back down. But Oregon has three of such reefs running across it. The Cascade is the biggest one—north and south. So that Oregon
708 has been to some degree separated, and that is the reason why that's only these passes that pass through the Harney Lakes and the Blue Lakes to get south. So that the people have been widely separated, and it has been the comment since the emigrant times, Oregon is away under in population. It has always been the hope and the dream of the fellow that rambles the plains that sometime he could bring that condition about. Certainly Oregon ought to develop up right agriculturally with Washington, southern Idaho—southern Idaho has gone ahead at the expense of the irrigation funds. Borah—what might not be so much of a political charge—but Borah has been a strong influence in Congress, and Borah has been after reclamation money, and Oregon has been after money to go down the Columbia River, and the heavy influence, the city influence of the State, has been looking down the river, and never looked back up on the hills much, and the sentiment of our State

has not been shaped, so that it has had the influence, apparently, that Washington and Idaho has got, that their cities and their towns, and their influence is out in where the State is at, and we have really been pretty weak along those lines; but I would say that I will give you my best service if you will grant this request that I am making and see that my contract is carried out. (1276.)

As to whether driving stock to Winnemucca is a practical thing at the present time, and at the price that is profitable—that is a wonderful thing, Mr. McManamy. That is the cheapest transportation that ever was, and the most pleasure in it. Of course, a herd of cattle now ain't very much to me. I was raised in the business, and, of course, my main business is trailing cattle. I don't think a fellow that hasn't ever got to trail any cattle ever has any chance to live.

709 Exam. ROGERS. Mr. Hanley, I didn't quite get the point of your mention of the investment of $35,000,000 in these so-called stub-end lines. Why are you concerned about that, if no part of that investment is yours?

A. Well, whatever money that is invested in the vicinity or in the State which you have property in is a part of your investment, and the maintaining of it is part of it. I think that that is really very much misunderstood as a public conclusion. It is the main reason why that it isn't right to allow two lines to parallel one another and spend the money that the tonnage of the country has produced in order to support that capital. It is perfectly legitimate that the country should be protected against that, but, on the other hand, the country shouldn't have any misunderstanding with it, and the (1277) part of that money which is invested in transportation in that country is their burden.

Exam ROGERS. Well, if under the prevailing laws the rates must be fixed so as to yield the carriers a reasonable return on their investment devoted to transportation service, would the level of freight rates be affected by the money necessary to yield that return on this investment of $35,000,000?

A. Well, with the capital that is invested in railroads within the State, in the State structure of the railroads, the lines that will be branches will be part of that structure. That is, a branch line has a very limited rate in accordance with the investment that is in it, to maintain and carry it, and that will be part of the State's burden of carrying their charge.

Q. (By Mr. MCCULLOCH.) Mr. Hanley, suppose this cross-State line all the way from Ontario to Coos Bay had been built and put in operation 25 years ago, and had been continuously operated
710 since then, what is your best judgment as to how the conditions in Malheur, Harney, southern Grant County, northern Lake County, and the territory traversed by that cross-State line, would be to-day if that line had been built and been operated for the last 25 years as a main trunk line from the east border line of the State

to tidewater on the Pacific Ocean, as compared with the conditions (1278) that you find in that country along the route of that proposed line to-day?

A. Oh, with the transportation and the opening up, any time it would come it would change the whole psychology of the State. There is no question about the tonnage. Of course, we are living in a time now that I don't think that any line should be built for local tonnage. The short line idea is passed. We are probably right on the edge when branch lines are apt to commence to come out.

Q. Well, supposing Mr. Hanley, that that line from Ontario to Coos Bay had been built across the State, east to west, as a trunk line, and operated the last 25 years, what effect in your judgment, would it have had in that period down to the present time on the industrial and commercial and agricultural development of the sections of the State of Oregon through which it ran?

A. Well, we would have been on the level with Washington. We would have been on the level with all our neighbor States.

Q. Do you mean by that, in mentioning Washington, that in your opinion the fact that the Northern Pacific, the Great Northern and the Milwaukee all have east and west lines across the (1279) State of Washington has contributed largely to the development of that State, as compared with the stagnation in development in the central portion of the State of Oregon? Is that what you mean by referring to the State of Washington?

A. Yes.

711 Q. Would you say the same thing was true as to the State of California, traversed east and west by the Southern Pacific, the Western Pacific, the Union Pacific, and the Santa Fe?

A. Why, sure. The unfortunate part of the Western Pacific—and I have spent a good deal of time with the locating engineers of the Western Pacific to get a line from Winnemucca to Coos Bay. That was part of the Gould plan at that time, to build a line—to make a Y of the Western Pacific at Winnemucca and run one line down here into western Oregon, and, of course, they would have come down right where the Natron road is at now, at the head of the Willamette Valley. It would have all been transportation in Oregon.

Q. Do you believe, Mr. Hanley, that if this cross-State line had been built 25 years ago and operated since, from Ontario to Coos Bay on tidewater, that the present development in the State of Oregon, and particularly in the Great Plains country east of the Cascade Mountains, would have been much more comparable to the development in the State of Washington (1280) on the north and the development in the State of California on the south than it is to-day?

A. Yes; it would, I am sure. There is no question about that in my mind at all. Speaking about the comparison, in boy days I

was a great friend of Jack Splawn's, and I went up there with him at one time—if Jack had lived in the same country as I did, or if I had lived in the same country as he did, I would have had an even break to go to the Yakima country—went up there to make a trade with Ben Snipe for Snipe's herd of cattle. I thought my other country had a better chance.

Exam. ROGERS. Which line do you think ought to build the cross-State line, Mr. Hanley? Which of the carriers do you think ought to build it?

712 A. Well, I have always been settled on one idea of locating lines. If any railroad adopted my idea, I adopted their location, and, as it stands now, knowing as to the kinship of the Southern Pacific and the Union Pacific and the Hill lines, and all of them, is that the real tonnage line is from Crane to what they call Odell, wherever that point is, but the survey known as the Harriman survey is the right survey. It was made when Harriman was equal as between the two lines and (1281) was looking at it strictly from a transportation heavy tonnage moving standpoint.

I think the Union Pacific, the Harriman system should build this line. That is, I don't believe in saying a fellow has to do anything, because I don't like to say it that way to him, but the way to say it to him is that the transfer of the Central Pacific is wrong if it makes that change.

I know the status of the right of way of the original survey across the State. It is fine, it is great, and the physical conditions of the country couldn't be bettered. The ideal road for the big tonnage to move on is to stand on this 2,100-foot level, anyhow, north and south, east and west. The climatic condition makes it specially favorable for trackage, and makes it specially favorable for all the reasons of transportation, for moving heavy tonnage.

Exam. ROGERS. When the original survey went across there, did the carriers acquire the right of way, or just make the survey?

A. Well, after they got up to Crane—it is all right of way. (1282.) There ain't no controversy about right of way. The whole country was right of way. The only place where they
713 have any trouble about rights of way is in the canyons.

Q. (By Mr. MCCULLOCH.) Mr. Hanley, just one more question, please. You mentioned a conversation in which some Union Pacific official—I don't remember which one it was—said that it took all the money the Union Pacific could raise to build lines in competitive territory.

Exam. ROGERS. Did your question say that the Union Pacific man said that? I understood that it was the Southern Pacific man.

Mr. MCCULLOCH. Well, now, I want to be sure. Who did tell you that?

A. Well, Mr. Kruttschnitt said that, which at that time I think that he was really of an equal position with both roads.

Q. Yes. Do you know or have in mind what lines he was referring to when he said "building lines in competitive territory"?

A. Well, the Oregon-Washington Railroad & Navigation, Short Line, or any of the lines. One idea with the country was that (1283) it was in a bottle. As I used to tell Mr. Cotton, when he kind of thought that I was stirring too much fuss, was that the fellow that was in the bottle, he had a surer right to work out the cork—he didn't have much of anything else to do.

Q. (By Mr. McCULLOCH.) Mr. Hanley, what do you think of the relative merits of the transportation policy on the part of the Union Pacific system lines of taking the funds necessary to extend their lines into Yakima and the Yakima Valley, in the State of Washington, already served by the Northern Pacific, to build a very expensive line up the Deschutes Canyon in competition with the northern lines to reach Bend, and to expend large sums of money to extend their lines from Portland to Puget Sound,
714 already served by two railroads, on the one hand, as compared with the policy of using their funds for the purpose of constructing such lines (1284) as we are asking for now to develop the resources of territory that had no rail transportation facilities already existing?

Mr. SPENCER. Now, I object to that question, or any discussion or testimony with respect to it, as not within the issues of this case, not responsive to any question submitted to the commission, by the pleadings, or within the scope of the pleadings in the case, entirely irrelevant and foreign to the inquiry.

Comr. MCMANAMY. Objection sustained.

Cross-examination:

The old line across the State as was surveyed, extended from Eugene, practically, there near Natron, across to Ontario. That is the Natron Road.

Q. Yes; called the Oregon Eastern.

A. Well, the Oregon Eastern, wasn't that the Yaquina Road? Wasn't that the Oregon Eastern?

Q. No; that was the Corvallis & Eastern, wasn't it? The Corvallis & Eastern was the old Hogg Road that went through the Santiam Pass, the Hogg Pass, wasn't it?

A. Yes.

Mr. DEY. Well, the precedessor of the Corvallis & Eastern was the Oregon Pacific, I think, what you have in mind? (1285.)

A. The Oregon Pacific? The road out of Eugene always has been known as the Natron cut-off. The Natron cut-off is a
715 convenience south, and the cut-off east. It was always a cut-off east.

The Oregon Eastern line was the company that was organized during the time of joint operation of the Union Pacific and the Southern Pacific, and was organized to build from Natron, near

Eugene, across the State to Ontario, and when it was organized along in 1900 the line to Vale had been constructed.

And that line across the State was the main line, and there was to be a branch from it down through to Klamath Falls, and another branch up into the Deschutes. That was before the Deschutes Railroad was constructed.

And the construction north from Klamath Falls, and south from Natron and west from Vale all started before they started on the Deschutes line. After the Deschutes controversy came on I had this (1286) conference with Mr. Hill.

Q. And organized this Boise Valley, or some railroad over there, and preempted the Malheur Canyon or part of the right of way through there?

A. Mr. Hill never got interested in us until after we got our show a'going.

Q. Well, as I understood you in your direct, you had the Deschutes construction ahead of this cross-State line, but the Deschutes construction didn't start until 1911, in there, did it? 1910 or '11? And the cross-State line was surveyed and construction started along in 1908 or 1909, in there, wasn't it?

A. Oh, yes; it had been surveyed, and then been renewed on this Government application. I think when we got the right of way up there that it hadn't been renewed; it had kind of lapsed, just taken for granted.

716 Comr. McMANAMY. Now, these dates are important. Didn't the Deschutes controversy, as Mr. Spencer termed it, begin along about 1907 and '08?

A. Commenced right at the time that (1287) we asked for that enabling act to get that referendum; that is, the next season after it commenced.

Q. (By Mr. SPENCER.) I think I can clear up that historical matter on that. In the interest of accuracy I think everyone will admit that the Deschutes was later than the cross-State line. The cross-State line was started before the Deschutes.

A. I know when the Natron cut-off was started and went up the Oakridge that we rested several years in the hopes that that would go on, but—now, when this cross-State line was under construction, the Union Pacific, in connection with the Southern Pacific, had access to all these railroads in western Oregon. (1288.)

Q. (By Mr. SPENCER.) Mr. Hanley, in your direct testimony you stated that on the first occasion of your going over into the eastern Oregon country with your father, as you got to the summit of the Cascades he made the comment to you that the timber would assure the transportation if you located in a big way on east, or words to that effect?

A. Yes.

Q. The thought being that the products of these forests would move on that line?

A. Yes; move east and west.

Q. Now I believe you stated when the line was located across the State from Ontario to Eugene it had access to all this trackage in the forests of western Oregon?

A. Yes.

717 Q. And that the first thought that occurred to you and to your father was if this plan could have been carried out, a reality, in other words, the timber could have gone across that line; is that right?

A. Yes, sir.

When the Southern Pacific and the Union Pacific were dissolved this line was cut-off same 15 or 20 miles, this (1289) survey, 15 or 20 miles west of Crescent Lake at Odell. There is no timber to speak of that that line could reach.

It is a fact that if the line is built the timber tonnage in western Oregon has got to support it to a large extent.

Q. Now how is the Union Pacific going to build and operate that line if it can't get that timber?

A. Well, when I say the Union Pacific, I feel like I am speaking more in a general term and speaking more under the time it was under the management of Mr. Harriman or Judge Lovett. That is before the separation. And my conclusion is that it was an absolute contract then, and there could not be any separation; there could not be any separation that would change the rights of the agreement; that is, that it had all the tonnage and all the access to all the harbors, especially if it were using Coos Bay harbor, because that was about the nearest due east and west we could get. I think that the money that actually goes into it as the rest of it is built under what I consider the system of (1290) the combination, that the combination rights go clear through on it.

Q. Well, but you have a condition now where the Southern Pacific has built its Cascade line and goes down through California and delivers the lumber at Ogden. Now if that is con-

718 tinued, or even if the Alturas line is built and it is carried to Ogden over that line, there won't be any of this western Oregon timber for the cross-State line, will there?

A. Well, I would feel as a witness in this case that this was an agreement as between carriers and myself for the State of Oregon, and I was no party as to this plan or had no notice that such a transaction was going to happen; that what that transaction was, that the money that was put in on this construction could not be changed with that same tonnage to route it a different way and a different way of taking it into or onto the Union Pacific. The Oregon Short Line and the O.-W. is the natural way for it to go through. It does not reach into these originating rails that the cross-State line is connected with. If that agreement bars this other agreement, it doesn't; but I don't see how it can bar it.

Q. But the Government separated the lines, the parties didn't separate them.

A. Well, I would say that the terms were general. It probably (1291) didn't have in mind specific cases, but it is certainly right that the cross-State line has access to all the tonnage in western Oregon and all the harbor connection; that the Natron cut-off is certainly entitled to the wheelage, or the charge that belongs to it, for constructing that line. It is a wonderful line and it is well built, and it is built for the purpose of that tonnage. But there could be no arrangement against this agreement of this east and west line that would take that originating tonnage and haul it south or send it any other way for the eastbound tonnage, without there was some
719 other reason besides the reason of an agreement. The money that was put in in the original idea that went with Oregon, was put in with that understanding.

Q. Well, you will affirm the proposition that if it is built and is to be sustained, this western Oregon tonnage that moves east would have to be routed that way over the cross-State line; is that right?

A. Well, I don't like the "if" in the question. It will be built and it will have access to that tonnage. Of course I am speaking more now in general terms, that there is nothing between railroad people and railroad agreements but what it is between men, and if there was something that needed specific attention, that is that didn't bar the other agreement, it can be remedied yet and these men can talk it over and remedy it. By "these men" I mean the two carriers (1292) or any other carrier. Now Mr. Hill made it plain that he had a trackage right under whatever way that railroads agree—I don't know anything about that agreement—down the Malheur Canyon, and his notion was that the matter of wheelage between railroads, even if they were enemies there never could be anything so bitter between them but that common wheelage was a right that they should always agree upon.

Comr. McManamy. Mr. Spencer, in view of your question to this witness and the statement previously made, are you in position to say, or would you care to say, to what, if any, extent the attitude of the Union Pacific would be changed if the western terminus were, say, at Coos Bay instead of Crescent Lake?

Mr. Spencer. Well, I could not say what the attitude of the Union Pacific is going to be, but the cross-State line was located there
720 and cut in two, and it was located to obtain the traffic from western Oregon to which it had access, and the mills in western Oregon are located on all these lines, many of these branch lines, the Springfield branch and the Tillamook branch and the Coos Bay branch, and of course there is the general production in the perishables. Now that tonnage is now originating with the Southern Pacific, and it is natural, and it will, as we assume, be contended for for the long haul. That has been our experience through the Port-

land (1293) gateway. And I am sure there is not anything that we can do, or be expected to do, to get it.

Comr. McMANAMY. You appreciate the fact that I don't want you to make any statement that you don't feel you should make.

Mr. SPENCER. Well, I haven't any authority, of course, to make any statement, and I don't know—but irrespective of that I can't see how a cross-State line could get into the places of production and get this traffic, and I don't see where the situation would be benefited very much by going over to Coos Bay. We would have a great interest charge to pay, and there is only about 2,000 cars of traffic originating over there, according to the record in this case. It all goes out by water.

Exam. ROGERS. Where do you think you would have to go, Mr. Spencer?

Mr. SPENCER. Well, I don't know. The condition is obvious here it would be unseemly for me to get in here and say what we might accomplish by going in there and coveting any of their traffic or their business. I don't see how we can get it, and I would not have any authority, as I say, to enter into a major proposition or discussion of that kind.

Comr. McMANAMY. I don't want to invite you to enter into a discussion if it is something you feel should not be done.

721 Mr. SPENCER. No. (1294.)

Mr. DEARMOND. I understand you to say that the Hill lines acquired a right of way up or down the Malheur Canyon?

A. Yes. They were got for Mr. Hill. That right of way was transferred to the Union Pacific.

Mr. DEARMOND. I wonder if there were any reservations as to common user over that road in that transfer, do you know?

A. Why, I know that Mr. Hill's statement was, what rights he wanted he had reserved them, he had what rights he wanted, and the other statement was that Judge Lovett will build your road, that he had protected me.

Redirect examination:

Q. (By Mr. McCULLOCH.) Mr. Hanley, prior to the dissolution of the Union Pacific system and the Southern Pacific that formerly under Mr. Harriman were operated under one control, it was the idea and intention that this cross-State line would be built by the so-called Harriman lines at that time?

A. The Harriman lines, yes, which included what are now the Union Pacific system lines and what are now also the Southern Pacific lines. (1295.) When I speak of it I speak of it as consolidated.

Q. Now you were asked some questions as to what carriers you thought ought to build this cross-State line. Irrespective of the dissolution or the merging of these two lines, would your views still

be the same, that if what constituted now the Union Pacific system lines and the Southern Pacific lines when they were in one system were going to build the line, that equally at the present time those same lines, namely, the Union Pacific system lines and the
722 Southern Pacific lines might fairly be required jointly to build the line across the State? Or do you get my question?

A. Yes; I get the question. I don't think there is any question about that, excepting that when it comes to questions that come down into their own affairs, that is a matter that when they accomplish what is asked for, what is expected, that the public should meet what you would call the public's convenience, why that would settle that as amongst themselves.

Q. What I was getting at is this, Mr. Hanley: That if the line is required to be built now, and if the Southern Pacific and the Union Pacific system should be required to build this cross-State line, the lines that would be required to build it would be the same lines that originally intended before the merger to build it?

A. It is still a joint question on a separated plan. It is still a joint question, sure. (1296.)

Recross-examination:

Q. (By Mr. Dey.) When that line was projected across the State it was intended to feed the Oregon Short Line and the Union Pacific was it not, with traffic from western Oregon?

A. Eastbound freight, yes. The Southern Pacific would participate as far as the summit of the Cascades; that is, they would get what would be south. The Southern Pacific would move over Southern Pacific mileage, the Southern Pacific and Central Pacific mileage as far as Crescent Lake, on what is now a main line of the Southern Pacific and Central Pacific between Portland and San Francisco. That was the original line—the idea projected.

Q. Once that traffic left Cascade summit, starting east toward your territory, it would not thereafter reach any Southern
723 Pacific rails, would it?

A. No; no.

Q. Now you mentioned several different names in your direct testimony, among them Mr. Cotton, for instance. You know that Mr. Cotton never had any official connection with the Southern Pacific Company, don't you? He was the counsel here of (1297) the Oregon-Washington Railroad & Navigation Company, wasn't he?

A. Well, Mr. Cotton was really Mr. Harriman's adviser. That is, I would say I would tie it to the time that he was appointed, or to be appointed, on the supreme bench, and I was in common conversation—I don't think it is divulging any confidence to say that Mr. Harriman was the reason that he didn't accept it. It was first he could not afford it, and second that he was very fond of Mr. Harriman and Mr. Harriman, he didn't feel like leaving him. I don't contend that Mr. Cotton ever held any official position with the

Southern Pacific. Mr. J. D. Farrell never held an official position with the Southern Pacific Company. He was always an O.-W. R. & N. Company man. He had the presidency in Portland here, after the dissolution of the Harriman system.

Q. And you speak of Mr. Kruttschnitt in the period when the Harriman system was in existence and he was in charge of maintenance of operation of the entire system?

A. Yes; when it was consolidated. (1298.)

Q. You say that this right of way in Malheur Canyon was conveyed to the Union Pacific; you mean to the O.-W. R. & N., do you not?

A. Well, I would not be specific as to what the records were, only as to the conversation with Mr. Hill, that he had turned it over to Judge Lovett.

724 FRANK J. NORTON was thereupon produced as a witness on behalf of complainants, and, having been duly sworn, testified as follows:

Direct-examination:

I reside at Sutherlin, Oregon. I have lived there 20 years. I am engaged in the fruit growing and canning business. Sutherlin is located 185 miles south of Portland on the Southern Pacific in the Umpqua Valley. (1299.) The canneries in which I am interested are located at Sutherlin, Oregon, and Roseburg, Oregon. I operate in the name of Frank J. Norton Company. I am president of the company. I have been engaged in the operation of canneries at Roseburg and Sutherlin about 15 years.

When we first started in the growing business we gradually drifted into the canning business and we started with a business of about five cars a year; now we pack between 125 and 150 cars. We also ship fresh prunes and some fresh fruit. In my figure of 150 cars I include both the Sutherlin and Roseburg plants.

As to the kind of fruits we can mostly: We start in the spring and we can some cauliflower, pack some in brine, and start with loganberries, cherries, follow (1300) with blackberries, pears, fresh prunes, apples, fresh beans, tomatoes. Broccoli, apples, pears, and fresh prunes are produced in large quantities in the Umpqua Valley. The climatic conditions of the Umpqua Valley are extremely favorable for the growing of fruits and vegetables.

In addition to the fruits that are canned, we produce very heavy in dried fruits. Douglas County, or the Umpqua Valley produces about 20 per cent of the entire production of the Northwest in dried prunes—has the past couple of years. Mostly Italian prunes are produced. Those are also shipped fresh. We have shipped for several years fresh when the conditions are right.

725 The conditions desirable to ship prunes fresh or green would be an early growing period which would bring us in at the same time as the Milton-Freewater districts, and also a dry summer.

A dry summer makes it desirable (1301) to ship on account of the keeping quality and the time in transit.

The market on dry prunes is in very bad shape this year. With a practically 10 to 15 per cent crop in the Northwest, there is no buying price at the present time. Crop conditions in California have made a very low price, and even with a low price and the low crop conditions in the Northwest, there are no prices out at the present time. The price for canned prunes is very much better than the dried-prune prices. That makes it desirable to engage to a greater extent in the shipping of fresh prunes. If it can be encouraged it should be, because the market on dried prunes is getting less each year. The domestic consumption is going down.

As to our problems with respect to the handling and shipping of fresh prunes at the present time, it is the carrying quality of the western Oregon prune. The western Oregon prune will not carry as good as the eastern Oregon prune. The only outlet to market at the present time is the (1302) Southern Pacific either by the Portland gateway or Roseville. The principal market for the green or fresh prune is Kansas, Nebraska, Iowa, Illinois. We ship them now via the Portland gateway. Most of them go via Roseville. On an average it takes 10 to 14 days in transit to one of our principal Middle West destinations. That will take you practically into the Missouri River points. Sometimes the fresh prunes stand that length of haul without injury or deterioration. Sometimes we have trouble. It depends on our season.

726 A shorter route would be of value in cutting down the time of transportation. The last two days on the transportation is when the damage is done. These prunes move under ice. (1303.) The cutting down of two days time would benefit the green or fresh prune industry in my section of the State as it would enable our prunes to get to the market in better shape.

Q. Do you feel you are actually hampered and prevented from marketing prunes in this manner in any substantial degree because of lack of direct routes?

A. Well, we don't know that it is because of direct routes but it is because of time of transportation. If we had a direct route we would cut down the transportation time. That would let the industry live, because it would take that many prunes off the dried market, which needs it badly. The shipment of fresh prunes would increase as long as the price of dried fruit is low. Our fresh prunes come in competition with Walla Walla and Freewater. Those producing points are two or three days further east.

As to what extent the shipment of canned goods, canned fruits and vegetables (1304) are affected by the length of haul—every day you can cut down the transportation you save interest on drafts. We have out sometimes $100,000 in drafts. Every day we cut off we save that much interest. The shortening of the route would allow us to get into points competitive in time. Jobbers now are buying

more frequently; they buy smaller cars, greater assortments. Any point they can make with faster delivery has added advantage.

At the present time jobbers do not carry heavy stocks of canned goods. The lightest ever known are the present stocks of
727 jobbers. They depend entirely upon direct shipment from producing sections to meet their demands. That is an important factor governing the disposition of our product. It also adds to our financial burden in carrying these goods.

In my opinion the construction of the cross-State line proposed in this case would be of material benefit to our section of the State. (1305.) Any direct line would save us in time and save us in transportation; also in our interest rates. There are no other important advantages that would accrue from the construction of the line unless we would have competitive service. We might induce the building line to go straight through, come to the coast. I mean if once constructed to Odell or Crescent we might induce them to build on to the Pacific coast. I think there are available and practical routes. There are such routes that would provide an outlet through the Umpqua Valley to the coast. There was a survey made. If such a route should ultimately be adopted and constructed, that would produce a still shorter route to our eastern markets. It would be shorter than via Eugene and Odell.

There are extensive areas in our valley at the present (1306) time that are not being, at least as fully as they might be, utilized if adequate markets were made available by more direct routes. Not only that, but the country has depreciated in the last 10 years. Orchards that were set out have been withdrawn by being removed from the land; and that is also becoming true now in prunes. Unless we get a different condition in the next few years there is a large number of acres of prunes going to be removed. I don't know how much of that is affected by transportation facilities, but, of course it is by markets. Markets are absolutely affected by transportation.

728 Cross-examination:

I can't tell you off hand how many cars of canned goods I shipped in 1927. Right around 100, Mr. Dey. (1307.) They went all over the United States. A few were shipped to Portland. Part of those moved out by boat. I think we shipped two cars by Portland gateway which went into Sioux Falls, South Dakota, by request of the shipper to ship on northern lines. I ship some to Portland and then from Portland by boat to New York City and all eastern coast. I would say about 10 cars out of the 100. In reaching Portland part of the time we use auto trucks. It is cheaper. Fifty per cent of the traffic that went to Portland from our plants went by auto truck.

Practically all of the 100 cars would go through Ogden. I think we only had one car that went to Texas, on account of cold weather we sent it clear down to Tucumcari to miss the cold weather (1308) going over the mountains.

Last year we shipped 21 cars of fresh fruit, mostly fresh prunes. They went all over the Middle West. About half of them moved through Ogden and half of them the Portland gateway. When I say through Ogden I mean via Roseville and over the Southern Pacific. When they go through the northern gateway, the Portland gateway, they strike the main line at Granger and would not go through Ogden. On those 21 cars we were able to compete with the eastern Oregon prune.

Q. It is generally recognized, is it not, that the western Oregon prune is not as good a shipper as the prunes from Freewater and over in the country? (1309.)

A. That is the opinion, but your biggest point there is the three days which they have the advantage of us.

Our traffic this last year or so has not been taken over the
729 Cascade line. They move by local freight. We only have one train a day. We have one local freight each way a day. That is taken down over the Siskiyous.

We are north of Roseburg. I have read of the so-called Alturas route, that is being built, in the paper. The Alturas line would be of benefit to us. It would save a trip over the mountains. It would save a trip over the Sierra Mountains in California. We would have better grades and a better distance, and it would fulfill to an extent, at any rate, the idea we are expressing here, if you build it. (1310.)

A few of the fresh prunes shipped through the Portland gateway, went into territory reached by the Great Northern or Northern Pacific. Of the 10 or 11 cars of fresh prunes that moved through the Portland gateway I would say all but three cars went over the Union Pacific.

We route our own shipments, unless the buyer specifically asks for a certain routing to favor some railroad that his plant is on their road. We control all the shipments. As to why we send most of our shipments via Roseville instead of via Portland, it is because the Southern Pacific has made us so many promises of what they are going to do in regard to freight rates, we have been catering to them to give them the shipments so they (1311) could not say we short-hauled them. But they have not lived up to their promises.

730 H. L. EMERSON was thereupon produced as a witness on behalf of complainants, and, having been duly sworn, testified as follows:

Direct examination:

I live in Los Angeles, California. At the present time I am employed by the General Petroleum Corporation. I am a mining engineer by profession. I have been engaged in mining engineering since 1896. I am familiar with the Alkali Lake in Lake County, Oregon. I am the engineer in charge of the construction and development of that property, the last work that has been done on the lake.

Alkali Lake is one of the most interesting places, not only (1312) in Oregon but on the face of this globe. It is a natural deposit of sodium carbonate. There is no deposit anywhere in the world that can compare with it in size or in purity of product. It lies about 65 miles in a northerly direction from Lakeview and about 130 miles in a southeasterly direction from Bend. It lays in the lowest part of the great sandy desert in east central Oregon. This depression of Alkali Lake is the immediate drainage point of a basin some 10 or 12 miles long and some 5 or 6 miles wide. It is a very interesting thing geologically, for all of the marks of geological periods are so plainly written there that any geologist can readily read the story.

In the early Paleozoic era this was a great, vast inland sea, and on the uplift of the Sierra Nevadas it became broken up into seas, and in the Tertiary period or in the Jurassic period it was broken up. In the Tertiary period it became a great desert, more arid and drier than any desert which we have in America to-day.
731 Then came along the Glacial period, during which vast bodies of fresh water were deposited in these low depressions, and later, in the Quaternary period, these depressions were so filled and eroded that they have taken the place and filled up gradually until we have shallow lakes all through eastern Oregon.

This lake is a dried up lake. When you approach it you (1313) look as though you were going to go to a vast body of water, but on getting near to the property there is no water there, except just a little bit around the outskirts of some parts of the edges of the lake, which has come from the nearby springs.

To the east of the lake lies the great mountain called Grays Butte. This great mass of rock sticking up there is of a feldspar nature, and to the south and east is the great Abert scarp, which is recorded in all geological history as being one of the wonders of the world. To the west and south lie rolling hills, but in this immediate territory everything drains into this lake.

Nature has performed marvelous wonders at this lake. No place, as I say, on the face of the globe do we find a product so pure from all foreign matter as we find at Alkali Lake. Take the water under the surface of the lake, or the muds, and analyze them and you find sodium chloride, sodium sulphate, and sodium carbonate. But nature in its vast laboratory at the lake has eliminated and put aside in some way that we don't know in our laboratories, we don't know how it is done, but the chloride and the sulphate are entirely eliminated, so that what we have over in Alkali Lake is a pure sodium carbonate, so pure that it is ready for the market. It is not a deposit like any of the deposits in California, or any of the
732 properties owned and operated by the (1314) American soda trust. There they have tremendous sums of money invested in chemical plants to tear down the sodium elements into its different parts to get the sodium carbonate. But here nature has done

it for us, and all we have to do is to work out a mechanical process, not a chemical process whatever.

In the working of nature the waters which have seeped through the clays and muds, and the impermeable muds beneath come to the surface and there crystalize, and as these crystals grow they grow together in bodies and press down on the mud and outward, so that these crystals cover vast area and to quite a considerable depth, pushing out and pushing up the mud, so that these crystals form in great pools, almost adjoining each other, only being separated by the little rim of mud which is pushed up by this work and by this process of nature. The mud is covered with a white powdery substance, as well as the whole body of the lake. The real body of the lake covers about 5,500 acres, all of which is held in fee under patent by the United States Government, and are owned by the American Soda Products Company.

The white mass or powder which covers the lake is the anhydrous soda. That is, the water has been evaporated and this white snowy mass covers the whole lake, so that it has (1315) the appearance of a great body of water at a distance. These pools of pure crystals of soda are exactly the same crystal that anyone would go to the store to-day and buy in the shape of sal soda or sodium bicarbonate. It is a product which you will find on sale anywhere. The only thing that we have over there is a little dust and dirt that has been blown in by the desert sands. We take these big pools which are crystalized, and which we have termed pot holes, and we dig
733 out the sal soda from those pot holes, put them into tanks, reduce it back to a liquor, the dirt quickly and easily settles at the bottom, the liquor is evaporated, and we have the soda ash of commerce.

Soda ash is used in practically every industrial art to-day. Its big usage is in laundry work and soap works, in paint manufacture; in the great oil industries tremendous amounts of it are used, and it is generally used in all of the commercial arts. There is no question about the purity of the product; there is absolutely no question about the supply. As long as nature lasts, as long as these great hills stand thereabouts, and as long as the feldspar hydrolyzes by the action of the rains, and the winds, and the suns, just so long will there be an inexhaustible supply of soda.

Now, sodium feldspar is broken down by hydrolysis. The formation, of course, is sodium hydroxide and hydrogen, aluminum (1316) silicate. The caustic sodium takes up the dioxide in the atmosphere and we have the sodium carbonate. When we take out the crystals of these pot holes or pools, the water immediately seeps in from below and begins to recrystalize. We have taken a count of some of these pot holes and averaged them up. We took an average count in one field of pot holes of 10,000 pot holes, figured them up, averaged their width and depth, and estimated that there were over 18,800,000 cubic feet of sal soda in those pot holes. And

by taking some of the soda from these pot holes and watching the action of nature for the next few years, we found that the crystals of soda reappear and refill these pot holes from which we had taken the soda. And in taking this one pot hole field and averag-
734 ing up these 10,000 holes, we estimated very carefully and figured out that in these 10,000 holes there was at least 56,000 tons of pure soda crystals formed each year, and this would continue as long at nature continues. There is no chance of anything happening, because the work has been going on for generations and for centuries. The mountains in the territory nearby is the great vast storehouse, the lake is nature's laboratory, and all we have to do is simply to take this pure product and transport it to cultivation and market it.

We have figured on various methods of transportation. We have figured on pipe lines. We figured in the war that if (1317) the war had lasted a little longer we would probably have constructed a railroad of our own to get the stuff out. But since the war time we have laid down the property and it is just simply setting out there in the desert and nobody is liable to run away with it. So we have not abandoned it. We are constantly figuring on some way to get the stuff out. I have been figuring very carefully since I have been here in Portland this past week on a new method of taking it out some way independently, so that we could get it to some sort of transportation, so that we could get it into the market. We have the market; there is an inexhaustible supply; its purity is unquestioned; the market is here; and all that has ever handicapped us in our work of development has been transportation. Briefly, that is the story.

This requires no treating at all, except taking the water out of it. When we put this water into the tanks, or these crystals, we have decahydrate of soda, which is $Na_2CO_310H_2O$. That means 10 parts of water to the carbonate of soda. All we have to do is to evaporate that off and we have the soda ash of commerce, or the monohydrate of soda. If you can drive a good bargain it sells from
735 $28.00 to $40.00 a ton. (1318.) I don't think the $28.00 a ton market would be delivered. It might be to some points on the coast. The most of it brings about $30.00 to $35.00 delivered on the coast.

That is a sample of the material I have just been discussing; that is the way it comes in nature. It is pretty well hydrolyzed and dried out. These masses we have here are practically the dust, which is the anhydrate of soda, or the lighter soda of soda ash.

The great properties of this soda in the United States are held by the American soda trust, which is commonly known as the Solvay process. Their headquarters are at Syracuse, New York. There they take the sodium chloride, which is common salt, and through a very careful and extensive chemical process reduce it down and get the bicarbonate of soda, the carbonate of soda, sul-

phate of soda, and the sodium chloride. It is an expensive process, but being controlled by the trust they have been enabled to dictate to the trade. (1319.) There are several points down in California where, during the war time, they took these saline deposits and put in some big plants there. There is one plant where the chemical plant alone cost over $1,000,000. It is the last word in the chemical process in the working out of their sodium products. There they have a trona deposit, from which they have to separate the impurities and bring down the sulphates, the chlorides, and the carbonates and some bicarbonates. But here we have nothing but the carbonate. Nature has done all the work for us, so we only have a mechanical process to go through.

We don't use this carbonate for baking purposes. The bicarbonate of soda is what you use for baking purposes. This is the carbonate of soda, and the bicarbonate of soda is a by-product
736 in the process of elimination of chloride and sulphate. We don't have the bicarbonate; in fact, we would not bother with it, because it is not worth while. We have a pure sodium carbonate, which is a commercial product which is used in all commercial arts. The soda ash is what we have; this is soda ash (indicating sample).

As to whether the product is used by natives of the country here, in its natural state, for baking purposes (1320) I don't know. They may do it. It would not be used generally as a baking soda. But you get the bicarbonate from the carbonate. To get the bicarbonate you would have to go through quite a little process to draw down the bicarbonate from the carbonate.

As to how far from the route of the proposed cross-State line this deposit is, I really don't know just how close the cross road line goes. I am not familiar as to that. All I do know is that we are seeking transportation, and we expect to go out to meet the railroad wherever it comes, or if it comes anywhere near us we will go out and meet it. That is all we have ever asked. We have asked for little help, and we are willing to meet the rest of the work. If the railroad comes within 15 to 20 miles of the deposit we would find means of reaching it. We brought it out by truck in the war time and trucked it over to Lakeview, 65 miles. But it was a pretty hard experience and we could not do that in ordinary times. We have actually operated on the lake and taken out the product and marketed it. (1321.) The only reason we didn't continue to market it was the lack of economical transportation.

As to how many carloads annually I feel we could promise the carriers, we can get out all that can be used. This coast uses up something upwards of 50,000 tons a year. We could supply the coast, and we could ship it east; we could ship it to the
737 Orient. We could draw out 100 tons of material there a day, and it would not be noticeable in the supply, because we have probably right now laying there untouched, ready for handling,

reduced down to the monohydrate, we would have probably 200,000 or 250,000 tons of soda ash now forming at the rate of 55,000 to 56,000 tons a year an average, as I say, from only the 10,000 of these pot holes.

For your information I have some photographs here that I took that might convey to your minds more clearly than what I am trying to tell you, if you would like to look at them. It is pretty hard to explain a matter of this sort. I think the photographs I have here would convey the matter to you very clearly. That is the lake as it looks (exhibiting photograph). There are the pot holes that I speak of. They cover vast areas of the lake. Just turn on another page; there is one where we are digging it out. (1322.)

We don't have any purification plant. All we would have to do would be to have an evaporation plant. It would not be safe to figure on nature as an evaporator over there, because we have a good many winds, the nights are very cold, then we have sudden storms. We would probably evaporate the water from the product over at the lake, because we could not afford to pay freight on water.

Q. Now approximately how many cars per day would you ship out, should you establish a commercial plant there? Have you made any estimates of that?

A. Well, that would depend entirely upon your sales energies, but if we established a plant at all the unit which we figured on building would handle—the first unit would handle and produce 50 tons of soda ash a day.

An estimate of 25 carloads a day for 50 years would be a
738 very small estimate. (1323.)

In connection with the project I have described there would be some inbound tonnage. We would have to take in our supplies for a camp of that sort. We would employ a good many men, of course. (1324.) The mining of this thing would have to be done in a wholesale way. We would have to bring in fuel; then we would have to keep our commissary and stock and mechanical supplies up. As to what kind of fuel would be used, I am at a question right now as to answering that. We have figured on oil, but I have discovered some very valuable coals in Oregon that I think might supersede the oil. I don't know.

As to an estimate of the probable inbound shipments, we would use a barrel of oil to a ton of soda ash, about, approximately speaking.

Q. Are there other products, chemical or mineral products, in the central Oregon territory which you have been discussing, which would be available for the support of a transportation system?

A. I don't know as it would support a transportation system.

Q. I mean that would be available for traffic over the cross-State line that is proposed here.

A. There are some very valuable mineral deposits, and more especially commercial minerals, because I have specialized in com-

mercial minerals the last 15 or 20 years. There are some very valuable commercial minerals, or non-metallic minerals, over in eastern and central Oregon. (1325.) Transportation is the only thing, or has been the only reason for the non-development of those deposits over there in that country. I prefer not to state what these deposits are and where they are, because my work is of a confidential
739 nature right at this time. I know that there are people who are examining and considering the development of other deposits outside of Alkali Lake, over in that neighborhood.

I am familiar with the mountain or butte commonly known as Gloss Butte. As to what that is and whether there is any commodity there that would be of commercial use, I think you probably would find others who are more capable of answering that question than I, because I don't like to reply to a question of that nature unless I have gone into it carefully and accurately myself. I have passed the mountain; I have seen it; in a way I know what it is. It is a tremendous big mountain of obsidian, which is pure silica, of course, in a hardened condition, the result of volcanic eruption, and I think that it will find commercial uses, but I think you will find others who are qualified to testify about that better than I, because I haven't made an exact and minute (1326) and definite examination of the property. I think the most common use of anything of that sort to-day is to use as fillers for cement or asphalt, or plaster purposes. I think more especially is that used—I know in California we used a great deal of those kind of materials for that purpose. I don't know as to what you refer.

In the production of this soda ash we have an advantage over the California product from the standpoint of the cost of production. That is the big thing with that property over here, because it is already purified for us. The fact that we would have to transport this a considerable distance to seaports and markets offsets the difference in our cost of production over the natural product. With the cost of transportation added, we have figured we would still have an advantage over the California products. (1327.)
740 I don't think there can be any question about that. If this product is developed by virtue of transportation, we would then be in such a condition that we could enter the Pacific coast markets and the markets of the Orient in competition, and in favorable competition, with any known source of supply. There is no question but that we would have an advantage over all competitors in the marketing of that product. The conclusion is inevitable that this product would move to market in preferance to the other.

Cross-examination:

I was a witness in the trial of the first so-called cross-State case, with respect to these deposits. I testified the same, I think, there that I have testified here. (1328.)

The American Soda Products Company is the owner of the title to these deposits in Alkali Lake. That is a company organized for

the purpose of taking title to these particular deposits. It does not own any other deposits of any kind, anywhere else. Its stock is owned by California people.

There is no one in the employ of the American Soda Products Company just at this time. I was the engineer in charge, and I have always been very close to the principals, and if any development work was undertaken in any way I would be in charge of it. I am up here now at their expense to represent them and to see about transportation and other things, and in a way, to tell the story of Alkali Lake, simply saying that we are looking for some little help to get our products out.

Q. Where would be the principal market for this product if it were mined and shipped?

A. I am a California man. I can't help but say that in (1329) California we look for everything to come to California. I think that the logical place to handle this property would
741 be San Francisco. If it moved over the cross-State line I presume the major portion of it would move over to the Cascade line at Crescent Lake, and then down the Southern Pacific main line. I am not much on your railroad matter. We might bring it into Portland and take it down by boat. I haven't gone into any of those details. The matter of that end of it is a matter which was never reached, because we are just waiting.

Q. A connection through Lakeview, Oregon, would give you the most direct route, would it not?

A. That is the way we hauled it during the war. To San Francisco I presume it would give us the most direct rail route.

The great body of this material is sal soda now. It hasn't been reduced to soda ash. Sal soda contains 10 parts of water, and soda ash contains (1330) one. Sal soda with the water taken out becomes soda ash. There is no difference in soda ash. Soda ash has one property only. There is a light and a heavy soda ash. As to what the market prices for light soda ash and heavy soda ash are I couldn't tell you definitely, because I am in the legal department at this time, and I haven't paid any particular attention to soda, or the sale or the market price of it. I am not up right now on the cost or the value of soda. The figure I gave of $28.00 is where we go over and buy it ourselves, the oil companies. When we buy soda ash in the market to-day we pay about $28.00 per ton, that is if we are fortunate in getting a fair price. (1331.) That is not delivered to our plant. We go after it, under our contract. We made a long-time contract, and we go after it. We go after it somewhere near 100 miles, I think, that we bring it in; possibly more.

742 When I was making a study of this property I figured upon production cost. As to what it would cost to produce this commodity and put it on the cars at Alkali Lake, I will have to refresh my memory. Those things I haven't gone into for a good many years. I can say that on the present market and under present

methods of manufacture of this commodity, that this deposit affords a basis for successful operation and distribution, because we have made vast improvements in the handling of all minerals and sorts of materials since I made the statements at the last trial. We can handle dirt or sand or gravel cheaper to-day than we could four years ago, so we would mine that much cheaper to-day than when we were figuring on it when I was at the property some 10 years ago. As to what it would cost us to produce this in the form of pure soda ash on the cars at Alkali Lake (1332) to-day, I haven't gone into the figures of it. I can give you my old figures. In 1917, allowing a margin, we figured we could mine it for 85 cents a ton. That is high—allowing everything handled by hand and teams, whereas to-day we wouldn't do anything like that at all. Figuring our gasoline at 45 cents a gallon, we figured that a ton of soda ash would cost us about $4.47. We didn't have any cars there. We just figured it at the plant, that is, after it had been dried, and all that. The oil is figured in on that $4.47. Everything is figured in (1333) including labor and all. As to the price of oil we had to figure pretty high, because we had to truck it in. It cost us $3.00 a barrel when we were doing our temporary work and preliminary work, trucking it in there, but it wouldn't cost us that when we got in operation.

Q. Well, of your $4.47, or whatever it was, how much did
743 you allow for oil?

A. Well, we figured it on the day's estimate. We figured $40.00 to the day. That would handle 850 tons production in a day.

Q. That would be about 20 cents a barrel for oil——

A. No, there is no way to figure oil that way. You don't burn up a barrel of oil to produce a ton of ash. You have got to (1334) take the whole product in its operation. I said, roughly speaking, we would figure, on our way of operating, a barrel of oil to a ton of refined ash.

Q. Well, in your $4.47 you didn't segregate the oil as an element of cost?

A. Segregate it? We added it in. I can't tell you how much we added in for that, because it is estimated in the whole process. I can get all those detail figures for you by sending down south for them. I only brought a general report on the matter.

Q. But your statement that it takes a barrel of oil to produce a ton of soda ash holds good, so that whatever the price of oil is there, why, we can easily find out how much the cost of the oil would be for producing a ton of the soda ash, couldn't we?

A. You can figure it that way if you want to. Then there's a lot of other operations, besides, that oil would be used for, than just simply evaporating the water out—you can figure very easily what it would cost to evaporate the water out of a dehydrator. (1335.)

Q. Now, can't you tell us, Mr. Emerson, when you figure out with exactness that it costs $4.47, I believe you said, to produce

744 a ton of soda ash over at Alkali Lake, how much of that $4.47 is to be paid for oil, oil being one of the principal things that you would use over there, I assume, or the principal thing, in the way of imported commodities?

A. Well, I will say to you, Mr. Dey, for your information that if we started a plant there to-day it wouldn't be anything like the plant we figured on then. With the new process of evaporation which we would employ there would cut it down so perceptibly that we wouldn't use those figures at all.

As to what that production was on the present day basis, I have the figures down south. I didn't bring them with me. I didn't know you would want them. I can send down and get them or send them up to you.

Q. Well, if you have made any such figures, have you any recollection as to the cost of production per ton——

A. I wouldn't make any statement as to the use of figures such as you desire me to state without the figures before me. I know we can produce soda ash over there so cheap with the new way of producing it that we can pay a pretty good freight rate and land it in the market cheaper that anybody in the United States can market it for to-day, and I can take the (1336) by-products of soda and pay an excessive rate clear across the United States and put sodium silicate into the Pennsylvania quartz sands fields, where they make it, and sell it cheaper than they can sell it for in Pennsylvania.

There is no such natural deposit as this anywhere in the world, except in South Central Africa there is one deposit there, and so far to date they have spent $9,000,000 trying to get a railroad into that property and they haven't reached it yet, but it doesn't compare in size and purity with Alkali Lake.

745 Searles Lake is a trona proposition, and nowhere can it be compared with this property. This isn't a trona proposition.

Q. Do you mean to say there is no production of soda ash from natural deposits on the west coast?

A. No, sir, I didn't make any such statement. I said there is no such deposit anywhere in the world that is as pure and as large as this Alkali Lake deposit. There are some impure deposits, but I have told you that they had to go through an intricate chemical process to produce the (1337) sodium carbonate, whereas nature has produced the sodium carbonate at Alkali Lake free and clear from all impurities, and all we have to do is to pass it through a mechanical process which costs nothing compared with the chemical processes employed in the industry to-day.

As to what percentage of the soda ash produced in the United States is produced from deposits, and what percentage by chemical process, there isn't any chemically produced from deposits, all produced chemically. They take it from the deposits. You can't get soda ash without getting it from a deposit. The greatest

property in the United States is at Syracuse, New York, where they have the biggest salt mines in the United States, and in Michigan and at Hutchinson, Kansas, but they take the sodium chloride there, and through the chemical process break down the soda ash. At Searles Lake and at Keeler they take the water and pass it through an intricate chemical process. The plant at Keeler, the chemical plant alone, cost over $1,000,000, and it passes through that chemical process, and there they produce, after it has gone through that expensive process, they produce what we have right over there in Alkali Lake without spending a nickel (1338) on it.

746 Q. Well, is there a difference between the Solvay process and the process used at these deposits in California?

A. The Solvay process practically controls the patents on the production of sodium carbonate throughout the United States. The soda trust is the Solvay process, the Solvay patents, and that is what you have got at Keeler, that is what you have got at Searles Lake. It is the only process that you can work. They are all using the Solvay process. We do not have to do that; nature has done all that work for us. We use only a mechanical process for putting this deposit on the market as soda ash; we don't have to have any chemical process in the work at all. We just dry the water out of it and box it up.

Q. (By Mr. SPENCER.) Now, Mr. Emerson, how big a package will you put this in? Will you put it in bulk or in sacks, or barrels, or in boxes? How do you pack it?

A. Well, it will depend a good deal on the freight rate we should get from the railroad company how we would have to handle it. We could ship it any way. (1339.) It is ordinarily shipped in sacks and barrels. It could be shipped to San Francisco. We can ship it anywhere; ship it to China from here. It is dense, quite heavy. We will probably put it in 100-pound sacks, if we use sacks, or probably 125 pounds to the sack. If we use barrels, we will use a like proportion. For 100 pounds I think the sack would be a little larger than a cement sack. It is a very easy matter to arrive it. You can go down here to wholesale houses and buy it. You can get that information quicker from them than you can from me.

I said that the plant that we figured on, the initial plant that we figured on, would produce 50 tons of soda ash a day.

Q. And you take 50 barrels of oil to produce that 50 tons! (1340.)

747 A. You are all wrong. No, sir; I din't say it would take a barrel of oil to produce a ton of soda ash. I said we figured on that to figure on the outside. All our figures are figured on the outside, and in the new process which we contemplate now we wouldn't use one-half of that. When I testified before I testified about the same way. That is some time ago.

Q. And you testified that you planned putting up this commodity and shipping it back to Pennsylvania and New York and undersell the big producers there?

A. I don't think I so testified. I didn't intend to say that. I don't intend to say it now. Why should I? You are getting me wrong. I say we could take some of the by-products of this soda ash and make a silicate of soda, because we have got the greatest deposits of soluble soda lying right out here in Oregon that is to be found in the world to-day; that is soluble at 212 degrees, while the (1341) Pennsylvania quartz sands require tremendous temperature for 72 hours, and 38 per cent absorption, whereas right out there you can make it 75 per cent absorption in one hour at 212 degrees with this soda ash and ship it east and make it so cheaply and so quickly and so simply that you can pay the excessive rate straight through to Pennsylvania and put it into the Pennsylvania quartz sands fields and undersell them on silicate of soda.

The American soda trust controls the markets of the country in this product to-day pretty generally. They know the advantage of this deposit over here, their engineers have examined it carefully and thoroughly. They didn't spend $1,000,000 on a plant down in California. Other people spent it, and pay them a royalty on their project.

Q. Well, these other people threw away that $1,000,000,
748 when they could have taken a fraction of it and gone right up there in Alkali Lake and produced the same commodity; is that right?

A. They couldn't go up in Alkali Lake. We own it. We are not going to let anybody go up and take our stuff away from us. (1342.) I don't think I would let them in on a fair basis of that million, because nobody would consider it, the Solvay people, or nobody else. Dr. Eyde, of Norway, was out here during the war, or before the war time, and figured on putting a nitrate plant out there, but railway transportation killed it. He was willing to do it. He was willing to put in millions and upwards out there to handle that property. No question about getting money to handle that property if we could have good transportation out.

Q. Now, you can move it all right when you get that wonderful highway from San Francisco to Yellowstone Park, can't you, that comes up through Lakeview, it will go right near this deposit, won't it?

A. Well, we don't intend to take baby buggies and push it out by hand. We are looking for railroad transportation. If we can't get it, why, we are willing to let it lie there. We don't propose to develop that in a half-hearted way, and if we can't develop it with railroad help we will never develop it and it will just lay there. We have a proposition of that magnitude that we can't afford to contemplate its use by trucks.

Q. And yet it doesn't sustain or justify its owner in building a 65-mile railroad of light construction to place it (1343) in competition with the other producing manufacturers?

A. My people are not in railroad construction work, and if
749 they would I would just ask you as a railroad man what

chance they would have if they built a railroad of their own to meet another railroad?

I said I knew of some very valuable commercial mineral over there. I made the first examination over there in 1911. I have made an examination of them since. My last work over there was in '22, but I have had engineers up there within the last year, associated with me. It is just as secret now as it was four years ago; it is until we get railroad transportation. I will say this, we import all that is brought into the (1344) United States of that chemical from Germany at the present time. If we can get railroad transportation over there we will produce it ourselves. I am not going to tell you what those minerals are, or anybody else, at this stage of the game. They are not connected with this operation, or essential to its operation at all. Absolutely different. The people are entirely different, separated, and different concerns are seeking to develop it.

Comr. McManamy. In order that we might get some idea as to the cost of producing soda ash at Alkali Lake, would you care to make an estimate of the probable cost under the new process that is the half of the cost you gave before, or third, or would you rather not make any estimate?

A. At this particular time we are running some experiments which I think are going to revolutionize the evaporation work on all of this class of material, and until we have got that finished, why, I can't definitely state the exact cost, but even if we take our
750 old cost at $5.00 a ton, or less, and pay our transportation, and sell it at market value, there is a big margin on it to-day. (1345.) The ordinary tonnage on this per carload, either in barrels or sacks, I think, runs about 25 tons, and from that up to 40 tons. If we produce 50 tons, it will be from one to two cars a day.

Redirect examination:

We attempted to operate this property by using trucks for a distance of 65 miles. It cost us $11.00 a ton to haul it out to Lakeview by truck. We couldn't afford to do it.

The product of Alkali Lake, or a similar product, is used extensively in the refining of oil. That is one reason I stated large quantities of it would move to California. We would move it to Portland, undoubtedly. I don't know much about Coos Bay, as to the handling of it there, but we would handle it to Portland. (1346.) It would be expected to move to some extent directly east. All the middle country, the Middle West country, could be handled with this product.

Recross examination:

Q. (By Mr. Dey.) How much of the soda ash of the United States if made by chemical process applied to common salt, as distinguished from the soda ash that comes out of deposits under chemical process or otherwise?

A. I don't think anybody would be justified in making the answer to that remark without careful and detailed investigation. (1347.)

751 F. L. YOUNG was thereupon called as a witness on behalf of complainants, and, having first been duly sworn, testified as follows:

Direct examination:

My present place of residence is Bandon, Coos County, Oregon. Prior to moving to Bandon I lived in Lake County. From 1909 until 1920 I lived at Alkali Lake. In connection with the Alkali Lake soda deposit I was superintendent in charge of all the work on the ground. I was employed by the American Soda Products Company. I was employed in that capacity for the entire period from 1909 to 1920. From 1909 until 1912 I was in the employ of the Oregon Borax Company, the original holders of the ground. I helped finance the first trip that was made to the ground, to the Lake, in 1902, and was one of the original locaters of the property. (1348.) The property was first discovered in 1902 and the character of the deposit first known.

For quite a period of time the work consisted in the annual assessment work on the property, until such time as we were able to make final proof and secure patent. After it passed into the hands of the American Soda Products Company, a California corporation, they not only carried on the annual assessment work, but lumber was transported and a number of buildings were erected for the housing of the superintendent and for the men and an office and shops, and so forth. The first attempt to prepare the product for market was in 1915. It was, of course, only a crude plant, erected in a simple way out of boiler iron, or boiler plate—I don't know just what they called it—and the product was hauled from the lake bed and put on this flat surface made out of these great plates of iron, and the heat was secured from a furnace underneath, and in that manner

752 we prepared the soda ash for market. That plant was actually operated. (1349.) The product was shipped to San Francisco and disposed of by Mr. Spreckels. I wouldn't know anything about that end. We hauled it by truck to Lakeview and shipped it over the narrow gauge railroad to San Francisco. The first plant was operated some three or four months during the summer of 1915. Operations were discontinued because of the cost of transportation. Evidently the enterprise didn't pay, because of the excessive cost of the transportation of the product to market. The next attempt made to do any development work on the project was in 1917. A plant was then erected and some attempt was made to make a soda ash in another way than that originally followed, but the soda that was shipped that year was most of it shipped in its natural state as sal soda, shipped to San Francisco. (1350.) The plant constructed at that time was a plant similar to those used by the Spreckelses in their work of making sugar. I should say the investment in that plant was in the neighborhood of $50,000.00. This

plant constructed in 1917 was actually operated but not successfully operated, because it didn't seem to meet the requirements of that kind of product. A portion of that $50,000.00 plant on Alkali Lake is still there. Part of it was removed. I presume there are two reasons why the plant was not continued to be operated. The plant wasn't the kind of a plant required for the dehydrating of soda, and, secondly, the shipping of the sal soda wasn't a profitable venture. We were shipping all the time the sal soda that (1351) season hauling it to Lakeview, a distance of 65 miles.

I am not a chemist. I wouldn't be able to say how many tons of the product were produced at the new plant. I wouldn't make any attempt. The total length of time that plants have been
753 operated on Alkali Lake would be perhaps about eight months altogether, take the two seasons. About $253,000.00 approximately has been spent in the development of the lake and in the construction of the plants for the manufacture of the product.

I heard the testimony of the preceding witness as to the conditions surround the lake, the size of the lake, and the quantity of the soda existing there. If I were asked similar questions concerning the matter my testimony would be substantially the same, except that I think he was very conservative. (1352.) I think the tonnage at Alkali Lake is inexhaustible. At the present time it is all available. There is about 18,000,000 tons there.

The plant considered by the American Soda Products Company there, the first unit was to produce 200 tons a day, and Captain Barnison, the president of the American Soda Products Company, offered to guarantee Mr. Moran, of the Nevada-California-Oregon, 100 tons a day to begin with provided it would extend the Nevada-California-Oregon out to the lake.

I am familiar with the location of the proposed cross-State line. (1353.) That would be about 14 miles from the deposit on Alkali Lake. It would be readily accessible from the lake. I am familiar with that portion of the country traversed by the old Harriman survey, as shown on the maps, in evidence here, across the desert. After it enters the timber out by Fremont I have never been over the survey.

Q. In your judgment, would it be practical to make slight variations in the location of that line, so as to bring it closer to Alkali Lake than the survey shown on these maps?

754 A. I think when they build there is one thing they will make which will bring them within five miles of the Lake and save considerable distance in the mileage and a fill two miles in length about 53 feet high.

Q. Are you at the present time financially or otherwise interested in the development of the Lake yourself?

A. I am; yes, sir. I am convinced that it will be developed upon the construction of the cross-State line. (1354.)

I would like to add this one thing, that in 1910 the Solvay Process people had two men at Alkali Lake for some considerable part of the summer, and that I assisted them in all their work on the lake. It was under my direction that the count of the pot holes was made, and so forth, and that those men said to me that it cost them at their plant at Syracuse, New York, $7.50 a ton to put their material where nature had put ours at Alkali Lake, and that for that reason we had that much advantage of them, especially on all the Pacific coast markets.

Cross examination:

There ought to be a part of the plant at Alkali Lake left. Some of it is so heavy I don't believe they could haul it away. The plant that was installed wasn't adapted for dehydrating of that product. It was the same machinery used in the making of sugar, and it wasn't successful in (1355) dehydrating soda.

It was Captain John Barnison, of San Francisco, that offered to guarantee 100 tons a day to the railroad down in Lakeview. I have forgotten the year when that was, but I should say possibly '19 or '20. I myself arranged the meeting between Mr. Moran and Captain Barnison. Captain Barnison is the president—not at the present time, but was for many years, of the General Petroleum Corporation at San Francisco. As to his connection with
735 Alkali Lake, he was the president of the American Soda Products Company, and is the largest owner of stock in the company. He still owns it. He isn't here. The captain is confined to him home all the time now, is incapacitated from business. As to whether they are in a position to make such a guarantee as that at this time or not, I wouldn't be able to answer that question, but the market (1356) ought to absorb more of this material than it did at that time.

R. L. SPANGLER was thereupon called as a witness on behalf of complainants, and, having first been duly sworn, testified as follows:

Direct examination:

I reside at Boise, Idaho. I am director of the bureau of markets of the Idaho State Department of Agriculture, having been director three and one-half years. My principal duties are enforcement of the bonded warehouse law, which is a law which requires all warehousemen doing a public storing business in the State of Idaho to take out a license and give bond. And, also, another duty is the (1357) enforcement of the produce dealers' law, a law which requires the produce dealers to be licensed and bonded in order to do business in the shipping of produce in interstate commerce. In addition to that, I have other duties. I act as administrative assistant to the commissioner of agriculture, and assist him in the administration of all departments. Furthermore, we from time to time make market investigations and are working towards the better marketing of agri-

cultural products in general. That's the main duties of our department, in fact.

756 Prior to becoming associated with the Department of Agriculture of Idaho I was an economist for the University of Idaho extension division. I was county agricultural agent previously, Payette County, Idaho.

I am acquainted with the agricultural conditions in southwestern Idaho. My duties call me to that territory frequently. We make trips over that territory probably on the average of once or twice a month. In the last (1357a) month I have made an average of once a week through those towns.

I have prepared an exhibit for this hearing in cooperation with another member of our department, Mr. M. L. Dean, director of the bureau of finance. The title of that exhibit is "Carloads of agricultural commodities originating in 10 southwestern Idaho counties." That is the exhibit which I have prepared.

(Said statement was thereupon received in evidence, marked "intervener's Exhibit No. 23, Witness Spangler.")

On the first page of this exhibit we have shown the carloads of the various agricultural commodities originating in the 10 southwestern Idaho counties, and have estimated the portion which we believe will move over the proposed railroad. We have enumerated the principal commodities produced in this section. I might enumerate them and show the number of cars loaded of each commodity during the year 1927 (1358), as taken from the railroad records. There was 31 cars of barley. They are shown on the exhibit. I will not read all of them. Totaling that, we have 12,684 carloads of the commodities, distributed as will be seen on page 1, which were shipped out. Now, of this number we estimate that 3,000 or 3,028 would move over the proposed route, and our bases for making

757 those estimates are different with different commodities. In some cases, the first four, we have used one-fourth as probably being a conservative estimate of the movement of the grain crops over that road. Then hay, we have only used one-tenth, for the reason that there is now an embargo against Idaho alfalfa hay, and it can not be shipped only as far as Baker into Oregon. I would qualify that, and state, however, that we can ship it in the form of meal. We have given a figure of one-tenth, or 47 cars, in that instance. There are now two alfalfa meal grinders in southwestern Idaho, one at Wilder, Idaho, and one at Payette.

We have shown one-tenth of the apples to move in that direction, which I think is a very conservative estimate. If (1359) that proposed road is built it will give us an outlet in Sacramento and San Francisco which we do not have at the present time.

We have shown here 104 cars of eggs to move over that proposed route. At the present time, or this past year there were some 56,000 cases shipped to Los Angeles on that—I can't remember the exact figures—in addition, at San Francisco, 6,594 cases—I should have

said, 22,069 cases to Los Angeles—I believe there are about 600 cases to a car, which would bring that up close to 80 or 90 cars already shipped over there, and I think that figure of 1[illegible] cars is certainly a very conservative estimate, because this particular section is in our principal poultry producing portion of the State, and naturally it will move over that most direct route.

Potatoes, we figure that 98 cars would move, which is about a tenth. I know for a fact that there will be that many, and probably as many times more, for the simple reason that our early potatoes are produced first on the Caldwell section, or (1360) in this southwestern Idaho section, and naturally they will move to the most direct point where they can be used, which is logically California. And right at that time or during the month of September, late August and September, Idaho potatoes are in demand from this section, first, because they are more mature than they are from the eastern portion of the State.

758

On page 2 there is shown additional carloads which will be available in 1931 from present area in dairy and poultry products, applying the rate of expansion during the last three years to the next three years. I have included eggs, poultry, and butter. During the last three years, for which we have figures, there has been 58 per cent increase or growth in the production of eggs, 50 per cent in the production of poultry, and 26 per cent in the production of butterfat. If we take this percentage and add it to what we would have three years hence we would have 60 more carloads of eggs, 33 cars of poultry, and 45 cars of butter, which would total 138 carloads, in addition to what I have mentioned, which would be available from the development of these two industries within the next three years. (1361.) That does not mean that that is all that is developed that would be available, it means that portion which under the percentages computed in the former table here would move over the proposed route. There would be available 120 carloads of eggs, and 66 poultry, and about 90 of butter. This is simply what we would estimate out of that increase would move over the proposed route.

Now, in the next table, the next portion of the page, is shown the additional carloads available by 1933, bringing into production one-half of the 51,350 acres, or 25,679 acres, on the Black Canyon project, which will be started in the very near future. It is assumed that 20 acres of land on this project will produce one carload of products, as taken from Mr. Madden's figures on the exhibit which he submitted the other day. I think his figures are very conservative. As pointed out by him, the average now in Canyon County is one car to 30 acres. Canyon County has a lot of bottom lands which are not under cultivation. This Black Canyon land is all high land; it lies level, and most of it will be put (1362) under cultivation.

759

Payette County ships one car to every nine acres in the county, and the Gem district, which joins this Black Canyon district, ships

one car in 20 acres. The conditions of the Gem district soil and that of the Black Canyon are very similar, and for that reason I have taken that as a basis in figuring the carloads produced on this project after five years. I have used the same proportion of commodities to be produced as we find on page one of the shipments in 1927. My reason for this being that all of these projects adjoin each other, and naturally under the same conditions we will find practically the same products grown—necessarily have to be, because our climate is only adapted to the production of those crops. Totalling that up, it would be 1,283 carloads produced on the 25,679 acres annually. That figure seems very small, but it figures one car to 20 acres.

Then in the second column we have estimated the number of carloads which would move over the proposed route in the first five years, similar to that which he estimates would now move under present conditions, or that which is produced now, making a total of 486 cars of that 1,283, or a little better than a fourth, to move over the new proposed route.

760 In the next column I have shown what would probably move after the project has been put into full production, a total (1363) of 972 cars would move over the proposed route, and those figures certainly are very conservative.

On the last page we have made a summary of carloads of agricultural commodities from the 10 southwestern Idaho counties to move via the proposed railroad.

From the present figures, as shown on the first page, 3,028 carloads from the land now under cultivation; within five years due to natural development of the dairy and poultry industries, 138 cars; and within five years from development of the Black Canyon project to be irrigated, 486 cars; making a total within five years of 3,652 cars. After the five years, when the Black Canyon project will be under full production, will add 486 more cars to that, making a total of 4,138 cars.

Now, the last item, potential traffic from Dry Lake, Mora and Hillcrest, Boise extension, mountain home and Bruneau projects for westbound movement, 8,003 cars. Those projects are—the development of those projects, of course, is somewhat in the distance, don't know when it will come in, but taking Mr. Madden's estimate the other day of one-third of the production on those projects will move over the proposed route, I think his figures are very conservative. After that time the Pacific coast will be considerably more populated than it is now, the consuming power on the Pacific coast, and particularly California cities, will be much greater; it is natural to (1364) suppose they will be able to consume a third of our products in that section, when these projects are in cultivation.

761 My compilation includes nothing for the Owyhee project. There can be no duplication between my compilation and that of Mr. Teutsch. The number of cars shown on the exhibit is the number that I estimate will move annually.

Q. (By Mr. ELLIS.) I notice on page two of the exhibit you have made no allowance for apples, whereas there is some testimony in this record to the effect that apples would be shipped westbound. How do you explain that?

A. I might have stated in figuring on page two, that basis of 1,283 cars, or the percentages, rather, were figured up leaving out apples, and on the first page this total of 12,684 cars shipped out. Well, on the new Black Canyon project, of course, in the first five years, there will be no apples to ship, so we have subtracted 4,909 from 12,684, giving (1365) a total of 7,775 cars, and from that we computed the percentage to figure these various commodities on page two. In other words, taking barley, for example, 31 cars out of 7,774 [sic] would give four tenth of one per cent. That is the basis figured all the way through.

As to whether we have had any success in exterminating the alfalfa weevil, we have come to the point now where it isn't necessary to even spray for alfalfa weevil. In other words, the alfalfa weevil has done no damage in the State of Idaho to our hay crop for four or five years, that is, damage sufficient enough to cause the farmers to spray as a means of control. However, there isn't much chance of ever eradicating the pest. But we have introduced into the State a parasite which has gone a long ways towards controlling it. No doubt the parasite is what is controlling the weevil to-day. (1366.)

762 As to what investigation I have made personally of the San Francisco and northern California markets for our products which would justify me in making the assumptions I have of the movement westbound to those markets, on October 3rd I started to Los Angeles, and worked north, making a market survey and determining the possibilities of our possible outlets for Idaho products. I was agent, or acting as special market representative, of the Idaho Department of Agriculture and the Idaho State Chamber of Commerce, who sent me there for that purpose, and my work there consisted in contacting the trade every day; I was on the markets every day, talked with the various men handling our commodjties, determining and drawing conclusions as to what the demands were for Idaho products, made reports back each week to our people as to what they wanted in the way of certain apple packs and certain ways of packing potatoes, and reported the condition. In other words, after three weeks in Los Angeles I think I understand pretty well what their demands were on that point. Also visited San Diago and worked on north to San Francisco, where I spent another week doing the same thing; visited the other bay cities, and worked on over to Sacramento. (1367.) I found in San Francisco that they didn't use Idaho potatoes to any great extent. To be exact, in 1927 we shipped two carloads of potatoes to San Francisco. I said to those fellows: "What is the matter? Don't you like Idaho potatoes?" "Absolutely, we like them, we like to use them, but we

can't use them under present conditions. If you can get them here to us at a rate at which we could use them we could certainly sell them, and we are sold from Oregon and Washington on the
763 same kind of potatoes," which I think are not as good as our potatoes produced in the drier climate, but at the same time they can be sold at a rate so much under what we could sell them for if we ship them there under present conditions that they are just not used. Taking it from the consumer's standpoint—I also questioned consumers who asked me why we couldn't give them Idaho potatoes; I simply made them the explanation that was given me, that they couldn't be used, when they could be put in there from Oregon and Washington cheaper than we could put them in there. (1368.) The Yakima district in Washington was shipping them in large quantities into San Francisco cheaper than we could. If the cross-State line were constructed it would mean that we would go into northern California with Idaho potatoes. There are enough people there acquainted with the qualities of Idaho potatoes—many of those people have come out here from the East, they know them from back there and would demand them if it was possible to get them in there. There would be no trouble whatever in developing a good market for Idaho potatoes if this proposed route was built.

Now, to move over to Sacramento. Sacramento and the adjacent cities near there do use about 250 carloads of Idaho potatoes each year. They want them, and will use more if this new road is built. It will be logical for the southwestern Idaho and eastern Oregon district to supply that market. It is a short haul. Especially in the haul, when the potatoes are slightly immature, it is absolutely necessary that they be moved to market as quickly as possible. If they are not, there is a certain amount or certain percentage of deterioration of cars, and naturally that cuts down returns to the producer, and the fellow handling them, the dealer. (1369.)

764 The condition as to other products is substantially the same as I found with reference to potatoes. In the case of apples, not very many Idaho apples are used in northern California at the present time. I questioned some dealers at Sacramento as to why they didn't use them. They said, "We can't get them in here at a rate where you can compete—or where we can compete with Idaho stuff against the Oregon and Washington apples." As to what principal advantages we would have in the northern California markets with the cross-State line's construction, as compared with the Los Angeles market, one of the big items is the fact that we could start a carload of produce to northern California—if the market is just not right at San Francisco or Sacramento it could be diverted down the coast to southern California, or before it got to California it could be diverted to Portland or Seattle. The chances are not so great there, however, because Oregon and Washington produce similar commodities. That would not be true in the case of live

stock. It would be a great advantage to livestock producers. That is one reason why a lot of the livestock now goes east, is simply because if they ship to Los Angeles they cannot divert the stock in case the market isn't right. If they could go over the proposed route they would have three principal larger markets to which they would have the choice of going. (1370.) The shortening of time in reaching the market would be of advantage. In the case of perishable commodities and going around the long route it sometimes requires icing two or three times. It was brought out by Mr. Wagner yesterday in shipping his butter he has to ice at several different points before he gets to points in California—or southern California. This would be true, also, of the shipments of potatoes or apples during the fall months, when it is warm.

765 Cross-examination:

Taking the list on Exhibit 23. We don't want to divert any barley en route; probably not corn; no oats; we might want to divert wheat. That is wheat we raise on both dry land and irrigated land. (1371.) Some of it is milling wheat. Some of it is hard. I couldn't give you the actual figures as to how much is soft and how much of it is hard, because I don't have them. We are not shipping a great deal of soft milling wheat into San Francisco right now; or Los Angeles. The large amount of our wheat is milled in Idaho and is shipped to southern points. It goes down to the southeast and some of it is shipped up to Seattle for export flour and some to Portland. San Francisco and Los Angeles are in that business to some extent. (1372.) One concern alone in San Francisco uses a large amount of Idaho wheat for milling purposes. Whether it was eastern Idaho or southwestern Idaho, I couldn't say as to where they got all of it.

Q. Well, were you talking for the whole State, or were you talking for these southwestern counties?

A. Well, in that case I was talking for the whole State. I made the trip for the whole State, but that hasn't anything to do with this exhibit. In making a trip down there for the whole State I was representing a district that was even a larger producing district than the southwestern counties.

Q. East of Minidoka?

A. Yes; and the American falls district.

Q. You don't claim any of that would go via this cross-State (1373) line, do you?

A. No; I am not making that contention at all. But I main-
766 tain this, that my study in that section of the State will give me some idea of the market demands for Idaho products, and if we produce them in this southwestern section they certainly would move over that proposed route.

Q. Now, you were talking about the necessity of the diversion privilege, and you think that it would apply to wheat. Now, where would you stop the wheat en route, and where would you divert it?

A. Well, we would divert it between Portland and San Francisco. That would be the only point there. I don't regard that as so important as some other commodities. We wouldn't divert hay, because the hay that is shipped over that line would probably be shipped for feeding purposes along the line before it gets to any large market. (1374.) We might divert apples very easily, if they can not be used in San Francisco and can be used down south in Los Angeles. As to what it would cost to divert them into the Los Angeles market from the San Francisco market I could not say as to that. I don't know how much it would cost per acre. The same as applies to apples would apply to potatoes.

Q. Now these trimmings are the only excuse you have got for the cross-State line, for the southwestern Idaho counties?

A. Why, no; I would say not. You mean so far as would be my only reasons?

Q. Yes; some of these accessorial services?

A. I should say not. It is a more direct route; it gets us there quicker; it saves icing; it saves expense—any number of things. (1375.)

Mr. SPENCER. At page 137 of Exhibit 16 Mr. Newell says, "I think in the beginning the new line will require only mixed train service of perhaps two cars daily each way. The reduced amount of engine and train crew service required would justify an estimate of 17 cents per car mile, at which rate the service would cost $47,000 per year." Now would any mixed train service across there help you as compared with the present main line service?

767

A. Well, if it got there quicker, yes. If you have a carload of apples on that train and it moves direct down there, it is certainly going to be an advantage to going around the other way, which would require a longer time.

Q. Well, why is it that so much of this tonnage, even tonnage that you say does not require diversion in moving to San Francisco even from the territory close to the Rogerson-Wells cut-off, goes around via Ogden and Salt Lake to San Francisco, instead of via the Rogerson-Wells line?

A. Well, there are several reasons. In the first place, the service is inadequate, especially for the shipment of perishable commodities. And another reason is, you have got so many different points you have to transfer. For instance, you go to (1376) Minidoka, you have got to stop there; you move down to Twin Falls and you stop there; you go on down to Wells and stop there, it is transferred again. You have got poor service there. Another reason is, that road was not built to serve this southwestern Idaho territory. As to what appeals the people made up there to get it constructed, I had nothing to do with that. I say it was not built to serve this southwesern Idaho country because of its geographical location. It is illogical to assume that you would ship from Caldwall, Idaho, say, down to Minidoka and back down to Twin Falls and the other way.

768 I haven't the figures showing the equidistant point on the main line of the Oregon Short Line between going via the Crescent Lake line to San Francisco, on the one hand and via the Rogerson-Wells line on the other, to San Francisco. I knew them once, but I (1377) haven't them in my head now.

Q. But that line has been a misfit and a failure and should not have been built? Are you speaking now for the Department of Agriculture of the State of Idaho?

A. Yes, sir: I would not say that the line should not have been built. I would say this: When service is given over that road as is given around the other way, the people of Idaho are going to use it. The tonnage will be tendered if you get the service, of course. But you have got to have the service there for icing before we can ship perishable commodities over that way. We can ice at Twin Falls. I have never been to Wells. I don't know just what they have down there. (1378.)

Q. Now these figures in the last line, as I understand you, are the cars you estimate of these different commodities that will go from the 10 southwestern counties to San Francisco and northern California, and also Los Angeles; is that right?

A. You refer to 3,028?—No, I would not say that. I would say any point along the line after loaded. I haven't attempted to estimate in that 3,028 how much of it is Los Angeles business, but it could very well move direct to Los Angeles by this way. I take 3,028 cars and say we are going to deliver them somewhere along the line, either at San Francisco, or Sacramento, or Portland, or Seattle, or Los Angeles, for the simple reason I have been down in those markets and I know something of the amount of the products produced in southwestern Idaho, that they can use down there and will demand. I was at Los Angeles. I
769 spent longer than 10 days down there. (1379.) I spent nearly three weeks there.

Q. How many cars did you determine then in that study that you were making there were going to Los Angeles? Were you preparing this study then?

A. No.

The cross-State line would be an advantage for Los Angeles business from this southwestern Idaho section; no doubt about it. It would not go clear around the other way.

When you say it is just as short around the Salt Lake way to Los Angeles as it is around the Crescent Lake way, when you refer to Crescent Lake, I don't know as I know just where you mean. I have heard of Crescent Lake. Do you refer to the cut-off between Ogden, or between Salt Lake and Los Angeles?

Q. No; I am talking about your connection up here in the (1380) Cascade Mountains of the cross-State line with the so-called Natron cut-off of the Southern Pacific.

Exam. ROGERS. They have applied the name Crescent Lake to this imaginary connection point between the cross-State line and the present Southern Pacific Natron cut-off.

The WITNESS. I understand now. It is a little shorter to Los Angeles by the Crescent Lake. I have done some figuring along that line. If I remember correctly the division point, the distance is around the eastern point of Elmore County somewhere, in Idaho.

Q. That is, to Los Angeles or to San Francisco?

A. Well, I won't say, because I haven't gone into that deep (1381) enough on the distances. I don't see that that has a great deal of bearing on this data as I have submitted it.

Q. Well, hasn't it? You are not giving us the destination
770 of these commodities of this tonnage that you have imagined and have in the second column of this Exhibit 23, which you say——

A. It is not all imagined, because some of it is already going there. It is not going by the cross-State line. We are going to put it over the cross-State line, if that road is built. You don't need to divert it, if you build a railroad. Now most of it goes around by Ogden and Salt Lake to Los Angeles. (1382.) We are going to divert it from that route and take it over the cross-State line down to Los Angeles from those southwestern counties; but not altogether, I would not. We would do it some because it is a more direct route.

I am not sure the Oregon Short Line is the biggest taxpayer we have in the State. I guess it is. It has spent tens of millions of dollars in our district in the last few years.

Q. And you want to take this business away from it and divert it across the cross-State line and down through on the Southern Pacific to Los Angeles?

A. It would not necessarily take the business away from it. As time goes on that country is going to be more settled. The farms in that section of the country are going to grow more concentrated products; they are going to be of more value. The tonnage will increase naturally. (1383.)

If as you say, it is 39 miles shorter by way of Salt Lake to Los Angeles over the Union Pacific unit than via the Southern Pacific, I would not divert this business.

Q. From Ontario, the extreme western shipping point.

A. In that case I would not divert it.

Q. Now you say that you only ship two or three cars of potatoes, I think it was—into San Francisco, and a very small
771 shipment of apples into San Francisco because you meet in competition there apples and potatoes from Oregon and Washington? That was correct, if I understood you?

A. Yes; if we have a cross-State line that condition will not obtain so much so. We may have a differential against us, both in distance and in rate, but it will be more easy to get in that market, if there is a road direct down there.

Q. Now you say, however, that you do ship potatoes, for instance, 250 or 30 cars into Sacramento?

A. Yes.

Q. Did it occur to you that those cars did not get the benefit (1384) of the water rate to the extent that the cars or shipments to San Francisco did, and that is the reason you get into Sacramento?

A. Yes; I know that.

Q. Now what is this last page here, potential traffic? You have got 8,000 cars here of that, from Dry Lake, Mora, Hillcrest, and these other projects. There are none of them constructed yet, are they?

A. No; as far as I know no provision or fund has been made from which their construction is to be now anticipated. I qualified my statement very well, I think, that it may be in the far distant future when those are developed. I said nothing about them being in the very near future.

Q. Now why do you fix five years as the measure for the production of 486 additional carloads? That is the Black Canyon production, isn't it?

A. Yes; if they start as they contemplate doing, the Black Canyon project will be in (1385) partial production in five years. After water is once put on the land these projects grow pretty fast. Four hundred eighty-six or 1,283 carloads is certainly not very much to be produced on 25,000 acres. We assume those 25,000 acres will be under cultivation after five years. They have already started
772 on the works. They have started surveying it long ago. Real construction, the letting of contracts, has not proceeded. The financing has not been arranged. But 486 carloads is not a very big figure. All of pages 2 and 3 of my exhibit are prospective with the exception of 3,000, or what was produced now.

Redirect examination:

Q. (By Mr. ELLIS.) Isn't the Black Canyon Dam, which is to be used in conjunction with this project, already constructed (1386), this Black Canyon project which is discussed in your exhibit, or do you know whether that Black Canyon Dam which has been constructed is to be used in conjunction with the project?

A. Oh, yes; that will be used.

Q. When you admitted that actual construction work had not been begun on the Black Canyon project, you did not mean exactly that, did you?

A. I didn't mean that part of it. I meant laterals and getting ditches into shape. The laterals and the ditches are only a minor part of the entire project.

As to whether construction work in the amount of approximately $1,400,000 has already been completed on the Black Canyon project, I don't remember as to the cost, but the dam has been in operation for several years.

Q. Now with reference to the question of diversion to the Los Angeles markets, assuming that it is 30, or even 50 miles farther to Los Angeles via the cross-State line and San Francisco, wouldn't it be an advantage to you to ship even that additional distance if by doing so your shipment would have available every market throughout the entire Pacific coast (1387) section from
773 northern California to the extreme southern end of California?

A. Yes; it would: It would be an advantage in cases of those commodities for which I thought I might want to select different markets. That would be an advantage. The only instance where there would be an advantage in shipping via Salt Lake would be a commodity which we knew we would sell in Los Angeles and would not want to offer on any of the markets north.

Recross examination:

The Black Canyon Dam is constructed. The dam for the reservoir has not been altogether constructed.

Q. A little diversion dam is constructed up there?

A. The construction now in place certainly will help. (1388.) Nothing has been done on the storage dam at all.

M. L. DEAN was thereupon produced as a witness on behalf of complainants, and, having been duly sworn, testified as follows:

Direct examination:

I reside in Boise, Idaho. I am at present director of the bureau of plant industry, Department of Agriculture of the State of Idaho, and am assistant director of markets. I have been engaged in the present position about five years. I have charge of the standardization work in connection (1389) with the growing of crops, grading of them, investigations in connection with the preparation of them for market, and the available markets for them. I have been in the Northwest about 20 years. Before coming to the Northwest I was engaged at Olympia, Washington. Before coming to the Northwest I was in Michigan. I was a farmer, and eight years connected with the agricultural college, about 13 years with college
774 extension work. In the State of Washington I was supervisor of horticulture, department of agriculture for four years. I was two years in the Wenatchee Valley. I assisted in the organization of the Wenatchee District Cooperative Fruit Growers Association and was assistant manager of that. My activities in the positions I have held have led me to make continual study of production of products and the distribution of them in the various markets. (1390.)

In order to perform my official duties I visit the different sections of the State of Idaho very frequently. The purpose of these visits is to watch the condition of the product, study the condition of it with relation to shipping. I am acquainted with the agricultural conditions in southwestern Idaho. I visit that portion of the State sometimes daily and sometimes weekly. There are possibilities in

that territory of increased tonnage in the near future on the land that is under cultivation. That territory has built drainage works, in the Boise Valley especially. There are some built around below Emmett. (1391.) They have been working on some of those drainage works this last year, and they have all been built within the last few years. Those drainage works are principally on the bottom lands, or the floor of the valleys. The purpose is to take off surplus water. The drainage of those lands should cause the lands to yield more production.

Other reasons for an added production in southwestern Idaho on the lands already irrigated are, a general improved condition of agricultural activities and better farming, diversified crops, and the increase of the dairy industry, which naturally improves the production of the soil, improves the fertility of the soil and thereby it is possible of increasing the crops, the production
775 naturally. It will improve varieties of crops, better seed, more attention paid to improved seed, certified seed.

I assisted in the preparation of Exhibit 19. I consider it a fair estimate of what it purports to be. (1392.)

[File endorsement omitted.]

776 PORTLAND, OREGON, *August 10, 1928.*

R. M. Fox was thereupon produced as a witness on behalf of complainants, and, having been duly sworn, testified as follows:

Direct examination:

I live at Portland and am treasurer of the Roach Timber Company, a corporation. This corporation owns a tract of timber in the Willamette Valley. This tract, consisting of two and three-quarter billion feet of timber, is located in Douglas County (1394), 14 miles from the town of Sutherlin. This tract is not at present under development and has not been in the past. I am president of the Sutherlin, Coos Bay & Eastern Railway, a corporation organized for the purpose of providing rail facilities to tap that timber tract of the Roach Timber Company. This railway company was organized in 1914 for the purpose of building a railroad from Coos Bay to Boise, Idaho. The company is still in existence as a corporation. As to what work, if any, in the nature of construction that company ever did (1395), eight miles of road were graded. The intention or purpose of that railroad project is to open up the timber on the north Umpqua watershed and on the headwaters of Coos River. The route of that proposed line from Coos Bay east would be as follows: From a point on Coos Bay up the Coos River to the divide coming over on Hubbard Creek, on the Umpqua watershed, down Hubbard Creek to Umpqua River and thence to the Calapooya Creek, and up the Calapooya Creek to the divide of the Cascades, and then due east to connect up at some point which we have not definitely ascertained, with the Union Pacific, to give

us a direct route east. Starting from Marshfield on Coos Bay
777 the general direction of the proposed line would be practically due east.

Q. Now, in crossing that country between Marshfield and a point intersecting the Southern Pacific Natron cut-off running, as you said, due east from Marshfield to such point of connection, would that line tap any extensive timber resources? (1396.)

A. That line would have tributory to it directly—I mean by that with no feeder lines—approximately 50 billion feet of timber.

Q. Is the territory traversed by the route of that proposed line now reached by any existing rail transportation?

A. No.

Q. How is the route of that proposed line with respect to the timber areas you have just mentioned, this 50 billion feet, located with respect to the line of the Southern Pacific from Eugene down to Marshfield?

A. Well, it would not come in contact with it at all, because it goes due west from Eugene and then down the coast, and this would go directly west from a point at Sutherlin. It would not come in contact with it until it got to Coos Bay.

The approximate distance between the route of my company's proposed line and the route of the Southern Pacific's Coos Bay branch as it runs west from Eugene (1397) and before it turns south is approximately 60 miles. It has been the intention of the company of which I am president to connect up its line with the line of the Union Pacific at some point in eastern Oregon. I think the most westerly point of the Union Pacific Lines in eastern Oregon now is Burns; I am not sure—Vale or Burns. There was a road built in from Ontario that we figured we might possibly tap, or go clear through to the Union Pacific. I think that at the
778 time that we had this under contemplation that short road from Ontario into the interior was owned by a different road.

The Public Service Commission of Oregon, in this proceeding, is asking for the construction of a line of railroad from Crane, the present terminus of the Union Pacific's lines extending (1398)
779 west from Ontario with the exception of the Burns branch, from Crane to a point at or near Crescent Lake on the Natron cut-off of the Southern Pacific. This line of railroad proposed to be constructed by the public service commission in this case would form a connecting link subtantially in the line of railroad that my company was incorporated with the idea of building. In the event the line were constructed that the Public Service Commission of Oregon asks to have constructed, the distance to build from Crescent Lake to tidewater along the route that we had mapped out would be about 150 miles. (1399.) The plans of my company for the ultimate construction of the line of railroad it was incorporated to build have not been abandoned. The organization of the Sutherlin, Coos Bay & Eastern Railway, and the purposes of its organization,

were connected with and related to the problem of marketing the standing timber of the Roach Timber Company. It would be almost impossible to estimate the value of the benefits which would accrue, so far as the interests of the Roach Timber Company and of the Sutherlin, Coos Bay & Eastern Railway are concerned, from the construction of a line of railroad from Crane to Crescent Lake (1400), because we have not only all of our timber but other large tracts in there, and it will give us a direct outlet to the east. It is absolutely necessary to have rail transportation to get our lumber to the markets, and that timber in there has all got to go to the Middle States, the interior markets, and it will never be opened up or operated or developed until it does get a direct route east. (1401.)

The timber of the Roach Timber Company is considered a mature tract and should be cut now. It will never be any more. The deterioration to-day is about equal to the growth.

780 By the Middle West I mean the Central States—probably Iowa, Nebraska, Kansas, and Illinois. I would not anticipate the movement of the lumber manufactured from the Roach Lumber Company's timber to the Atlantic seaboard, by carloads, because you couldn't ship that far. You would come in contact with the lumber that is shipped by boat through the canal to the Atlantic coast when you get in about as far as Pittsburgh; that is about as far as you can ship by rail.

The timber of the Roach Timber Co. is about 65 miles from tidewater on the Pacific coast. (1402.) It would be possible to ship lumber manufactured from the timber of the Roach Timber Company to tidewater on the Pacific coast and then transship it by water through the canal to the Atlantic coast but it isn't as profitable as to manufacture it for and ship to the Central States, that market. There are sawmills located at various points on tidewater in the State of Oregon that manufacture fir lumber and ship it by water to the Atlantic coast through the canal. The movement by water from such mills is quite substantial. In my judgment, interior lumber mills of the Willamette Valley may successfully engage in competition with such tidewater mills for business of the Atlantic seaboard markets, but not profitably.

Exam. ROGERS. Mr. Fox, you said a little while ago that some construction by other carriers would be of inestimable value to someone. I didn't understand just what it was. (1403.)

A. Why, I think the question was that it would be—what value it would be to the timber owners which that would tap. There would be several large tracts, to say nothing of innumerable small tracts, that is, people that hold smaller tracts of timber, that it would open up. Our idea was that there was three big tracts

781 that need a railroad; this road possibly would open up those three tracts, without calculating on about 5,000, 3,000 acre holdings in there that would put in small mills, and all that small stuff.

Exam. ROGERS. Did you have in mind that the new construction would connect with your construction?

A. Oh, no; I didn't have any idea about that. We have only got eight miles of it graded. The matter of it to tie up with our construction would be immaterial, as far as that is concerned.

Mr. MCCULLOCH. I think the examiner had in mind, did you not, Mr. Rogers, his proposed construction? That is, your company has a line of railroad projected across here, and I think Examiner Rogers wanted to know if the line of railroad that the public service commission is asking to have constructed across the State would fit in or tie up with the proposed route of your own line over to the Natron cut-off? (1404.)

A. Why, yes; if they come down the way we are talking about it would be identically the same route that we have been figuring on.

Exam. ROGERS. The question I had in mind was whether the witness contemplated the completion of the proposed construction that he has got, or whether he was now expecting some other carrier to do what he started out to do?

782 A. We have always had in mind to complete that construction some day. We are not railroad builders, and if that road could be built by some other road, naturally that is what we would want. In other words, it is only contemplated as a necessity if we operate that tract, that is all.

Cross-examination:

All of the timber holdings in which the company, which I represent, is interested are located east of Sutherlin. (1405.)

The termini, as stated in its articles of incorporation, were Marshfield or some other point on Coos Bay, on the west, and Boise, Idaho, on the Oregon Short Line, on the east. We wanted to build the road from Coos Bay to some point where we would meet with the Union Pacific, which we hadn't definitely determined. In order to get some operation on our tract to start with, we built from the Southern Pacific at Sutherlin east to the timber. In considering the Coos Bay territory, we had in mind reaching tidewater; (1406) also two other tracts of timber, not owned by us, on the headwaters of the Coos River, between Sutherlin and Coos Bay. We have built just eight miles of the fourteen from the Southern Pacific main line at or near Sutherlin to our timber tract. There is no track material on it. It was graded in the latter part of 1914 and 1915. The cessation in the progress of the work was caused by war conditions. A good deal of emphasis should be laid upon a through route to the east for our lumber products when they are milled, and in that connection I know of the Southern Pacific's new development from its Cascade line near Klamath Falls through Alturas to the Cen-

783 tral Pacific in Nevada. I do not know the difference in mileage between that route and this route that is proposed.

(1407.) Our purpose is to eventually reach the Union Pacific lines for distribution of our product in the Middle West.

Assuming that the Alturas Line is only 215 miles longer than the proposed cross-State line, and considering that it connects with the Union Pacific at Ogden, that line would not satisfactorily serve our purpose. Our lumber wouldn't travel that way. It would go south to Sacramento, and then on to the Union Pacific over the Southern Pacific route. Whether, upon the completion of the Alturas line, which is now under construction, our lumber would naturally move over that route because it is substantially over 200 miles shorter than the Roseville route, well, I don't know. That would be a matter for the railroad company. If they wanted to take it, it would be a round-about way, I should imagine, to take it that way, to get up to Klamath Falls and then clear around through, as to take it over their main lines to Sacramento and Ogden. The routing of that, of course, would be a matter out of our hands. I don't know what the Southern Pacific might do about it. At the present time, all the lumber that is there is taken south to Sacramento and then Ogden and east. (1408.)

Sutherlin is 17 miles north of Roseburg and is, therefore, 185 miles south of Portland and about 60 miles south of Eugene. So that with the completion of the Alturas cut-off our lumber could move to Eugene over a main line, then over the Cascade line, which is a main line, through Klamath Falls and Alturas to the east.

In building from Sutherlin direct to Coos Bay it is necessary to cross one mountain range, the Coast Range Mountains;
784 and if our proposed line were extended from Sutherlin, or from our timber tract, on the route that we plan, it would necessitate piercing the Cascade Mountains.

I do not know whether the territory through which it would go in the Cascade Mountains is materially different (1409) from the territory through which the Cascade line or Natron cut-off of the Southern Pacific goes, so far as difficulties of construction are concerned; I have never been over that Natron cut-off. So far as we have it laid out, we reach an elevation of 3,753 feet on our proposed route from our timber east. That is not over the top of the Cascades. A tunnel is not contemplated that is carrying it clear back in there—I can't tell you exactly how far, but clear in back of the headwaters of Steamboat Creek. As to crossing the Cascades at some point, we couldn't definitely determine how much of a tunnel we would have to build, and as to how much grade we wanted. If we wanted to keep the maximum grade, for instance, two per cent, we would have to build a proposition involving a tunnel. That same condition exists over the Coast Range. We know we can get over the Coast Range by a two per cent grade by building a small tunnel. If we wanted to build a longer tunnel we could make it a one and one-half per (1410) cent grade.

Q. Now, to accomplish your ultimate end, which I understand to be to reach the lumber markets of the Middle West, could you not build east from Sutherlin until you reach the Cascade line of the Southern Pacific, and then follow the Alturas route, on a much more sound economic basis than to attempt to build clear across the State of Oregon to reach the Union Pacific on your own account?

A. I don't know as I could say that, because—that is, an-
785 swer that with any knowledge about it because we have investigated that—that development, you see, in there all came about since we planned a development ourselves, and it is dropped, and we haven't gone through now today and say that it
786 would be cheaper for us not to build any further than that. But at the time we had that under contemplation, and I still think it exists, and that is it would be more economical for us to start east and tap this other road and open up that territory and give us tonnage for the road.

It is in the neighborhood of a hundred miles from Sutherlin to the Cascade line of the Southern Pacific by such route as we would have to (1411) take to get over the Cascades.

Our line is surveyed east from Sutherlin and projected for a distance there of possibly thirty miles and we have had a preliminary examination of the route from Sutherlin west to Coos Bay. We have had maps prepared and adopted just on that part of the road which we are building on. We didn't have any profile made of the whole route. We were building our main line fourteen miles—that would get to the timber—and we would probably then branch, and we would have later on continued the main line through. We didn't complete any of the fourteen miles. We graded it eight miles. (1412.) At that time we contemplated the construction of a mill two miles east of Sutherlin, two hundred thousand to two hundred twenty-five thousand feet daily capacity, eighty-hour run. That was in '15. The mill hasn't been constructed. The Roach Timber Company owns the timber. Its home office is at Muscatine, Iowa. We haven't entirely abandoned the plan to construct and operate the mill. It isn't opportune to build it now. I don't consider there is more softwood lumber being manufactured than should be at the present time. (1413–14.) The lack of transportation has caused us to defer the matter so long. We bought the timber in 1906, '07, '08. We knew the transportation conditions when we bought it. The Roach Timber Company owns about two and three-quarter million. Now wherein a road over to Crescent would assist our transportation, there is difficulty in getting timber shipped (1415)
787 out from western Oregon, since you have but one route, and a round-about route, and only one railroad to contend with. All you have to do when you go to try to interest anybody is to tell them you are on one railroad. They ask you what railroad and you tell them the Southern Pacific and you are flat. You are flat be-

cause they are not interested in developing property on the Southern Pacific Railroad—one road.

Q. Why don't you put a mill down there and start your operations and call on the Union Pacific for cars through the Portland gateway?

A. A fine thing to stick about three or four million dollars down there in a mill and expect the Union Pacific to furnish you cars.

Q. Well, if you gave them the business they would furnish you the cars, wouldn't they?

A. If they didn't have any place else to put them they probably would. When you would need them the worst there would be plenty of demand for them elsewhere and you would not get (1416) them.

Q. Now you think the Union Pacific is too far away at Portland; is that it?

A. Well, you can't get cars from the Union Pacific. You are on the Southern Pacific.

Q. Now how would you get cars from the Union Pacific if it terminated up here on Crescent Lake on top of the mountain, the other side of the Cascade Mountains?

A. Well, as I understand it, the condition is that the Union Pacific is going to build through, and, we hope, build
788 through our timber, and then we will be right on, not only the Union Pacific but we will be on the Southern Pacific.

Q. Oh; in other words, you are anxious for competitive transportation operations?

A. That is the only way you can get cars to ship your stuff.

Q. Well, who gave you the impression that the construction in this case contemplated taking the railroad over through your holdings?

A. How is that?

Q. Where did you get the impression, Mr. Fox, that the railroad construction contemplated by the petition in this case would reach the holdings of your company?

A. I don't know what the petition is, but there is certainly timber there that needs a railroad. If the Union Pacific is going to build through there, or we build through to the (1417) Union Pacific, we would have no difficulty getting across from the Union Pacific and taking them to our own plant over our own road, would we?

Q. Well, that route has been open for a long time from Sutherlin for you to complete the construction of your railroad. Now you said a little bit ago that you contemplated that the construction would take the Union Pacific over to your operation; now what did you mean by that?

A. Why, there can't seem to me to be more than one meaning to that. If the Union Pacific would come down through that country and open up that timber it would certainly be of inestimable value to all that timber in there, because what it needs is transportation east.

Q. Well, I know, but counsel's question called your attention to the terminus of this line at Crescent Lake, and asked you how
789 far it was from Crescent Lake over to the coast, how far it was to Sutherlin. Now you say it would not do you any good at Crescent Lake; that is right, isn't it?

A. No; I didn't say that.

Q. Well, is that the way you want to be understood?

A. I did not say that the railroad would be of any value to us at Crescent Lake.

Q. Well, you said what you wanted was to have it come on down (1418) there and take your timber, didn't you?

A. Come down and open up the timber in that country, sure.

Q. That is what you expected, if they got to Crescent Lake?

A. No; I didn't say any such thing.

Q. Now what is your expectation?

A. Nothing in the world, but if they put a railroad through there and open up that timber it will be of inestimable value to all of that timber, because that is what it needs, and that timber won't move until it gets it.

Q. Now this line it is contemplated will terminate at Crescent Lake?

A. I don't know that.

Q. You are 100 miles away, with the intervening mountains of the Cascades. Now how are you going to bridge that gap?

A. That is not my problem.

Q. Well, wherein would the line terminating at Crescent Lake be of any more value to you than the line terminating at Portland?

A. I don't see as it would.

Q. Well, it has taken quite a bit to get an understanding
790 on that proposition, but I was just wondering. Now you don't think the Southern Pacific would take that lumber from your mill, if you built one at Sutherlin, and give it to the Union Pacific at Crescent Lake, do you?

A. I didn't understand your question. (1419.)

Q. You say you don't build because you only have one railroad, that you would not be justified in putting in an expenditure of several million dollars development with only one rail service?

A. Yes, sir.

Q. I understood you correctly?

A. Absolutely.

Q. All right. Now if you should build on the Southern Pacific and the Union Pacific, or the O.-W. R. & N. Company should build across from Crane to Crescent, you would not feel any more secure about service than you feel now with the Union Pacific at Portland; is that right?

A. That is right. In other words, the Southern Pacific would have no more inducement to deliver our lumber, manufactured at our mill and destined to Union Pacific territory, through the Crescent

gateway, than it would through the Portland gateway. The Sutherlin, Coos Bay & Eastern Railway is still a live organization. Its authorized capital stock is $500,000. I wouldn't build that railroad from Coos Bay on the Oregon coast to Boise, Idaho, for the purpose of harvesting two and three-quarter billion feet of fir timber (1420), but that would open up a good many billion feet more. I would not classify us as railroad builders but we operate mills in Minnesota, Florida. We also have railroads, common carriers.

Exam. ROGERS. Mr. Fox, if the Union Pacific or the South-
791 ern Pacific built the extension requested from Crane to Crescent Lake and stopped there and put in through routes and joint rates with the Southern Pacific, what could your company, either as to mills or railroad, be depended upon to do?

A. If the Union Pacific was just built to Crescent Lake, which would make a necessity for our lumber originating on the Southern Pacific still to be taken up to Eugene and around to Crescent and then east?

Exam. ROGERS. Yes.

A. I don't think it would be any inducement at all. (1421.)

Exam. ROGERS. Well, in that case do you mean that your company, either as to its railroad or timber, could not be depended upon to do anything in the way of further development?

A. Well, are you talking about the railroad, or if we would do anything?

Exam. ROGERS. Yes.

A. I could not say at this time whether we would be interested in further development of that road or not. If that were done, any more than we were before.

From the information we have, it is our judgment that if we were projecting a line to Sutherlin, projecting our railroad to get across the mountains, the proper place to go through the mountain is at Crescent Lake. I could not say whether we would hit just at Crescent Lake or in south further than that. The important part is to get over to Crescent Lake, where there is a low divide, and to get in and follow that ridge down, in coming over the ridge there down to the Calapooya Creek, and we would come (1422) right down through our timber. There would be a continuation of our route. The pass over the mountains that I have in mind for the approximate

location—go out from Sutherlin and go up the Calapooya
792 Creek to the forks, then take the North Fork and start climbing here on this divide, that runs through here. You have got all that ground there to run through. You would not get up to the Bohemia mines; you would be in south of that when you would go up through here, then you would come out in here to Crescent Lake. I don't know whether we would get out in here at Crescent Lake or over here [indicating on map]. That is about 100 miles south of Crescent Lake. We have never had any estimate made as to the cost of such a line for that hundred miles. (1423.)

Q. You said something that I didn't quite understand with respect to mentioning the fact that you were located upon Southern Pacific lines and then any proposal would fail; will you tell me just what you mean by that—why a proposal would fail?

A. Because of the general opinion among the public of the lack of car service on the Southern Pacific road.

The mill we had in mind was to cut 200 to 225 thousand feet of lumber a day. There are quite a few mills on the Southern Pacific lines that cut at least that much; that have that capacity. Understand, I am saying eight hours a day. Now, there are mills that naturally run two shifts or three, the same size mill, but it would be cutting three times as much running three shifts. (1424.) A 200,000-foot mill for an eight-hour shift is not a large mill as mills go.

I have personally handled shipments of lumber. Not from the plants where we have manufactured it. We have never manufactured out here. But we buy large quantities of lumber out here and ship it East. But we are fearful of a car shortage if served by only one railroad.

As to whether I can name a single mill of all the mills on Southern Pacific lines in western Oregon that has been
793 short a single car in the last six years, that is, since 1922; I could not give you a specific instance where application for cars was made, because since we stopped our development down there we haven't investigated the car situation on the Southern Pacific. (1425.)

Redirect examination:

Q. Are you operating a mill, or have you a mill constructed at the present time, Mr. Fox?

A. Not in the West.

Q. And did you take that fact into consideration when you answered Examiner Rogers's question as to what could be expected from your company in the event this line were constructed to Crescent and joint rates prescribed?

A. It would not improve the situation any different from what it is now. I didn't mean from that that we probably—even if that was done we never would operate down there unless somebody built a rail to us, but it would not improve our situation a bit as to what we have now, if we shipped through the Portland gateway or around through Sacramento.

Q. Wouldn't there be some shortening of the mileage East?

A. Well, it would not make any difference in the rate to us, or the service.

Q. What is the importance of expedited service to the market East at the present time, if you know?

A. You have got to, because of the change in the market condition you have got to have quick service, because it has changed from

what it used to be. The yards in the East don't carry a large stock; they depend upon the mills to do that, and you must get your deliveries through quick. (1426.)

Q. In that event would a saving of from 200 to 400 miles in distance be of importance to western Oregon mills?

794 A. It would be if the railroad would take advantage of it and give us that much quicker delivery.

The only advantage that would be derived from the construction of the east and west line as far west as Crescent would be if it became necessary for us to build our own line to get the direct connection east, we would not have to build any further than Crescent. It would be practical as a timber development, considering the amount of timber tributary to the proposed line, to construct a connection across to Crescent. (1427.)

795 (The following question and answer were read: "Would it be practical as a timber development, considering the amount of timber tributary to the line that you propose, to construct a connection across to Srescent? Answer. Yes.")

Exam. ROGERS. The reason I asked that that question be read is I understood a while ago the witness to say it would not be feasible or practicable to build that 100 miles in order to develop his timber.

Mr. ELLIS. Well, I didn't so understand it.

The WITNESS. Well, I am assuming that his question contemplates naturally the other timber resources on a road from Coos Bay to Crescent Lake, and all the timber that it would open up would be tributary to that road. When I said yes, that is what I had in mind.

There are some mines along the line of the railroad which I have described, between the coast and Crescent Lake, that would be benefited by such construction; I am not well versed on that sort of thing. Such a line would tap the Umpqua Valley. I am including the entire line, Coos Bay to Crescent. Either one would tap the Umpqua Valley. Sutherlin is in the Umpqua. (1428.) The watershed, and Umpqua Valley.

There are some large sawmills located at points seryed exclusively by the Southern Pacific Company in western Oregon, I believe. The Oregon Electric runs down through there, which gives them a Great Northern connection. For instance, Mill City happens to get the Oregon Electric, or Silverton; Eugene has it; and the mills at Dallas. I don't know whether they get the Great Northern connection or not, but there are mills over at Toledo. I don't think those mills are of a capacity that would be considered

796 large mills to-day. They are not nearly as large as the tidewater mills in the State of Washington. They are not nearly as large (1429) as the mills of Portland (thinking of the Columbia River). The other mills I mentioned at Toledo are on tidewater. The Toledo mill is the largest and about the only one of a real large

operation located on the Southern Pacific. There is a large operation at Marshfield, too, on the Southern Pacific.

The Roach Timber Company is affiliated with lumber products, manufacturers, and sawmills in the east through common stock ownership. Those affiliated interests are the Roach & Musser Sash & Door Company at Muscatine, Iowa; the Virginia & Raney Lake Lumber Company at Raney Lake, Wis., and the Standard Lumber Company in Florida. The Roach & Musser Sash & Door Co. at Muscatine, uses Pacific coast softwood lumber (1430), to a large extent. A very small part of the product of the timber sawed into lumber would move to the Roach & Musser Sash & Door Company with the development of the timber tract east of Sutherlin.

THORNTON T. MUNGER was thereupon produced as a witness on behalf of complainants, and, having been duly sworn, testified as follows:

Direct examination:

I live at Portland, Oregon. I am in the research department of the United States Forest Service. My title is director of the Pacific Northwest Forest Experiment Station. I have been in the forest service (1431) 20 years and in charge of this particular research department for four years. In this work I have been employed almost entirely in Washington and Oregon. In my work in the Federal Forest Service I have made studies to ascertain the rate of growth of Douglas fir forests. I made a study in 1909 and 1911, which
797 . was published the succeeding year, and in the past four years under my direction that study has been continued—a study of the rate of growth of Douglas fir forests in western Oregon and Washington. The results of such studies have been reduced to the form of standard yield tables—tables which show for different qualities of land what rate of growth may be expected at different periods. We carried them from 20 years up to 160 years. Those show in cubic feet and in board feet on the (1432) normal acre, the different kinds of land. I have made some computations of statistics for the 15 counties of Oregon west of the Cascade Mountains and north of the Rogue-Umpqua divide; that is, excluding the counties of Jackson and Josephine. The total area in acres of those 15 counties in round numbers is 15 million acres, or to be exact 14,959,000 acres. The net area in those 15 counties comprised in existing national forests is 3,926,000 acres. I have an estimate of the timber standing on this last mentioned acreage in the national forests at the present time; it is about 77 billion feet. The area in those 15 counties in private and State ownership, and what is called the Oregon-California land grant, is 11,033,000 acres. The area in those 15 counties in 1925 in farms was 3,835,000 acres. The approximate area in those 15 counties, in 1924, that were in crops (1433) other than timber crops, was 109,000 acres, that is, in crops harvested, according to the statistics of the Department of Agriculture. (1434)

In 1926 the acreage in these 15 counties in commercial timber lands, that is to say, private ownership, State ownership, and in the so-called Oregon & California Land Grant, was 5,158,740 acres, according to the figures of the State forester. My estimate of the stand of timber on this last mentioned area is 181 billion feet.

798 Q. Now, what is your estimate, Mr. Munger, of forest land—when I say forest land, I mean by that land that is better adapted for use as growing forest crops than for any other purpose—that is included in private ownership, in the Oregon & California Land Grant, or in State ownership? What area?

A. I am of the opinion that it is very conservative to state that approximately 50 per cent of the existing private State and O. & C. acreage in this area is absolute forest land, will probably continue to be devoted to forest purposes for an indefinite period, and that means 5,516,500 acres.

I have made an estimate, also, of what I call absolute forest land in the entire 15 counties, including in that the acreage in the national forests that would answer that description; (1435) including the entire acreage of the national forest, which is practically all absolute forest land, it amounts to 9,442,500 acres.

Based on these estimates of acreage and existing stand of timber, I have also made estimates of annual growth on the private, State, and O. & C. grant lands. Taking our yield tables, and discounting them by 30 per cent as an allowance for poor utilization and occasional losses by fire, understocking, and so on, I have assumed that this land will grow at the rate—is capable of growing at the rate of anywhere from 250 to 800 board feet per acre per year, and, as an average figure for the entire territory, 532 boad feet.

The 532 board feet being per acre, per year, I can state, then, the estimated annual growth on private, State, and O. & C. grant lands, based on the acreage and stand that I have previously estimated. That amounts to 2 billion 933 million board feet.

799 I have computed similarly the annual growth (1436) exclusively on the timbered stand in the national forests in these 15 counties. That average growth is not as high as for these private lands, because it is a higher altitude, and more rough, rocky, and barren land. The average growth I have judged to be 234 board feet for the area under consideration. That is per acre, per year, and that would make the estimated growth of the timber now in the national forests in these 15 counties annually, 919 million board feet.

My estimate of the annual growth of timber, both in the national forests and in private, State and O. & C. grant lands annually, aggregated, is 3 billion 842 million feet, board measure. (1437.)

I have information respecting the period of time in which it is necessary to grow a tree of Douglas fir to a size where it can be cut and sawed into lumber. That, of course, depends upon the character of the land and the product desired, but there is considerable timber being cut in the region as young as 50 years now.

Under favorable conditions of soil and climate the annual growth of Douglas fir timber will run as high as 1,500 board feet per acre per year on small areas.

In the Forest Service, and for the purpose of the standard yield tables I have mentioned, the lands are classified or rated as to productivity. The yield tables provide for five different qualities of land, with a range in growth proportionally. I can give the minimum and maximum ranges of growth employed for the purpose of these standard yield tables (1438) annually per acre, in
800 board feet. The rate of growth for the first quality is 1152—the best quality of land, and 96 is the very poorest quality, of which there is very little in the region under consideration.

L. C. MICHENER was thereupon produced as a witness on behalf of complainants, and, having been first duly sworn, testified as follows:

801 Direct examination:

I reside at Cottage Grove, Oreg. In appearing in this hearing I represent the Chamber of Commerce at Cottage Grove. Cottage Grove is located 22 miles south of Eugene and has a population of from 3,000 to 3,500. The principal industry of this community is lumbering. (1439.) At the present time three sawmills are operating in this neighborhood and a fourth, Anderson & Middleton, is not cutting any timber at the present time. All of these sawmills are located in or adjacent to Cottage Grove. They obtain their timber supply from territory lying west, east, and southeast of Cottage Grove. I have information as to the amount of merchantable standing timber tributary to the Cottage Grove area. A number of cruises have been made, and apparently none of them are exact, but taking these cruises as a basis of making an estimate, it is variously estimated at from 56 to 76 billion feet. The timber that is west of Cottage Grove is on the east slope of the Coast Range, and on the headwaters of the Siuslaw River (1440); that east of Cottage Grove is on the Row River and tributaries, and that southeast is on the Coast Fork of the Willamette and its tributaries.

As to whether the timber which I have described will eventually be milled in Cottage Grove and that vicinity, or whether some of it will go to other milling points, this timber has got to come through Cottage Grove in some way or another, some form or another. It can't get out in any other way.

This timber is not being cut very fast at the present time. As to whether any of it is being manufactured by mills other than the three I have mentioned, there are any number of small mills.
802 When I say "small" I have in mind mills cutting up to 30 or 40 thousand feet a day.

The interest of the Cottage Grove Chamber of Commerce in this case is the development of this district. We want to see this timber cut (1441) and marketed, because there is a large portion

of it that is ripe, in fact, some of it is over-ripe, and we depend on lumbering.

Q. In what manner do you believe the construction of the cross-State line would benefit your community and hasten the cutting of your timber supply?

A. It would give us additional transportation facilities.

Q. How would that lumber move to reach the cross-State line?

A. It would have to go to Eugene, from Eugene to Crescent Lake over the Natron cut-off.

Q. Would that materially shorten the distance to the Middle West and Eastern markets?

A. Evidently it would.

I am familiar, in a measure, with the present practice with respect to the marketing of lumber and the extent to which a shortening of the distance or the time of transportation is important. The present situation in that respect is this: We have to look to the markets of the Middle West for our future business. We can't afford to cut and ship lumber by rail to California in competition with offshore shipping of the Coos Bay and Tillamook Bay mills, Columbia River, and the harbors of Washington. We can't compete with those.

There has been a change in the lumber trade that would cause the factor of distance of haul or time in transit to be more important at the present time than it was (1442) a few years ago, so far as lumber is concerned. The lumber dealers owning the yards of the East don't carry as large stocks as they did a few years ago,
803 but they depend upon prompt shipments from the mills of the West to supply their trade. The effect of that condition on the mills of the Willamette Valley, it seems, is to work a little hardship on us. At the present time we can't get the transportation to the East that we would like to have. It takes too long, apparently, for our lumber to reach the Eastern markets. As to whether that is true in the Middle West and on the Atlantic coast alike I don't know so much about the Atlantic coast. It is true of the Middle West. We don't ship much to the Atlantic coast, very little, and all of that is cross-country—transcontinental—shipment.

I have information indicating the markets to which the lumber from the Cottage Grove district now moves. Under partial production last year, no mill running (1443) to full capacity, we shipped 1,606 cars south over the Southern Pacific, mainly to the State of California, with minor shipments to other lines served by the Southern Pacific only, and 1,800 cars even to the districts served by other lines, that is, the Pacific Mountain States, the States lying between the Mississippi River and the Pacific mountains, and that east of the Mississippi River. These two figures constitute the total lumber shipments from Cottage Grove during the year 1927, that is, a total of 3,406 cars, 1,606 of them south and 1,800 of them to the territory to the north and east. Of these 1,800 cars 368 went east of the Mississippi River. We have no service at Cottage Grove that

enables shipments to be made by water to the Atlantic seaboard. (1444.) We have to depend on rail service exclusively.

I obtained the information of shipments during the year 1927 from the records of these lumbering concerns.

I have nothing to add to my testimony except that we would like to have a little rail development in Oregon so we can get
804 this lumber out. That is all we are interested in.

These 1,800 carloads did not move through Roseville and Ogden; they moved through the Portland gateway. (1445.) The records show the shipment from Cottage Grove as being either north or south. This 1,600 carloads went south from Cottage Grove; the 1,800 carloads went north. That is, they moved Southern Pacific to Portland and then were turned over to the Oregon-Washington Railroad & Navigation Company and the Milwaukee and the Hill Lines.

The Standard Bridge Company of Omaha, Nebr., have a seasoning plant at Cottage Grove and have a new way of seasoning lumber. Last year they shipped 253 cars. They expect to increase this to 1,800 cars annually, which will take care of the cut of all the small mills in the vicinity of Cottage Grove, and that relates only to the lower grades of lumber, having nothing to do with the clears or uppers.

In checking up on the shipments from Cottage Grove I was not (1446) endeavoring to find out the actual routes traversed, but was checking particularly to find the States of destination. I do not recall whether I made a particular check of those figures to find out the actual route followed. As to whether I am certain that all of the 1,800 shipments moved through the Portland gateway, that is the information that these mill owners gave me. Their records showed that to be true.

Cross-examination:

My business is accounting but I have been connected with the Cottage Grove Manufacturing Company; due to the fact I was appointed chairman of Railroad Committee of Chamber of Commerce of Cottage Grove, I got these figures out. (1447.) Am under contract to go with the Wiest Brothers' sawmilling outfit when
805 they start operations. The Anderson & Middleton Milling Company have completed their long pond and they are going to construct a mill, to have largest operation around that territory. They have a mill at Cottage Grove but haven't operated it since the first of December, last year. Apparently they are not very well satisfied with the present shipping facilities. (1448.) They own the Oregon, Pacific & Eastern Railway, a sort of a logging road and their new mill is being constructed on that. I only traced the 1,800 cars as to States of destination. Cottage Grove is south of Eugene and it is possible, but hardly probable, that the 1,800 cars might have gone to Eugene and then east over the Southern Pacific New Cascade Line, as I have the figures showing destination of the cars shipped

over Southern Pacific south. Sixteen hundred cars went into California and southern territory. (1449.) It is immaterial whether it goes to Eugene and then over the Natron cut-off, or whether
806 it goes south over the Siskiyou route—we call it shipping to the South. The people in our territory have not paid any attention to the construction of the Alturas route. The newspaper reports state that it is being constructed, that is all I know. We haven't given much consideration to how much it is going to shorten our present routes because lumbering is in a slump. We have more timber adjacent to Cottage Grove than any other town in the United States. There are lots of other parts of Oregon that also have great quantities of timber. (1450.)

We don't want to remove the slump by the cross-State line; we would like a little better price. The price of lumber is depressed. The demand is sometimes equal to the cut, and at other times isn't. Anderson & Middleton moved in at Cottage Grove within the last three or four years. (1451.) They are big operators on Grays Harbor and the Union Pacific runs into Grays Harbor; also the Hill Lines and the Milwaukee. They were operating up until some time during the month of December, 1927, when they closed down, I mean at Cottage Grove. A part of the 1,800 cars originated from the Anderson & Middleton mills; can't say definitely how many (1452) but a very good percentage. Because these cars were destined for points in the Middle West, Missouri River territory, and in the inter-mountain territory, I concluded in the main that is where they were destined; and that they went through Portland, since the figures I have show their trails by cars, 1,606 cars south, shipped south from Cottage Grove, the destination was California, Nevada, New Mexico, Texas, and one car into old Mexico. Those were on the Southern Pacific route proper. With the exception of a few cars that went into Idaho and Washington, the other 1,800 would go to points east of Ogden and over through the inter-mountain country and the
807 Missouri River country (1453), and Montana. I can't positively swear that none of the cars went down through Roseville and go to the Union Pacific at Ogden, but the routings which I looked at don't show that to be the case. (1454.)

I can't be positive as to figures, but I believe from Eugene to Crescent Lake it is 98 miles and 22 from Cottage Grove to Eugene. The Southern Pacific Line shows 144.5 miles from Cottage Grove to Portland.

They don't carry the stocks in the Middle West they used to and they want the service. (1455.) They want the mills to carry the investment in their stocks, so they won't have to carry it. I can't positively state what advantage would accrue to our mills by turning that lumber over at Crescent Lake to a cross-State line, as compared with turning it over to the same railroad at Portland, but it wouldn't do us any harm. Development is always good. (1456.)

Redirect examination:

The difference in distance of 142 miles would, I presume, make a difference of 24 hours, approximately, in the delivery of the lumber to the East.

Recross-examination:

They figure a hundred to two hundred miles a day, I believe, as a very fair average for the shipments of lumber. (1457.) Largely the lumber shippers allow the carrier or the purchaser to route their shipments. The mills pay very little attention to the routing. I won't positively say it is a fact that a car of lumber out
808 of Cottage Grove takes six weeks to reach its destination in any part of the United States. That is hearsay on my part. (1458.)

LYMAN GRISWOLD was thereupon produced as a witness on behalf of complainants, and, having been duly sworn, testified as follows:

I am a civil engineer in private practice, office Porter Building, Portland; about thirty years experience in civil engineering. In 1917, prior to enlistment in Army, I was employed by the Portland & Southeastern Railroad Company, as chief engineer. Upon my return from overseas service (1460) Chief Engineer Huson employed me in survey work. Later I made some power investigations of the property. The original proposed location of the railroad in which I was involved was the construction of a line from Mt. Angel to Bend. Mt. Angel is 31 miles in general southerly direction from Oregon City in the Willamette Valley. The general route traversed by the proposed line from Mt. Angel to Bend (1461) was from Mt. Angel to Silverton, thence southerly through Sublimity to Stayton, thence up the north fork of the Sanitam River, through Hogg Pass to the eastern side of the mountains, to the town of Sisters and from there to Bend.

Q. I hand you a map marked Exhibit 17 and ask you if the proposed line of railroad is shown thereon.

A. I think a part of it is. I see no indication of the line from Mt. Angel to Stayton and from Stayton up the river, but there is a line up that north fork belonging to the Southern Pacific Railway, and there is a dotted line on this map that would seem to connect the Southern Pacific line with Bend.

By dotted line I mean dashed line extending in a northwesterly direction from Bend. That seems to be the general route. I never saw this map until just a little while ago. I have not been
809 (1462) over all of the route between Bend and the point where a connection is shown on Exhibit 17 with the black line extending easterly from Albany up the south fork of the Santiam. The surveys of that route were made by other men. I had the maps and profiles and had arranged to go over all of that line when litigation stopped the work. I am familiar with the general character of the country traversed by that proposed route and the character

of necessary grades but don't remember the rate of grade between Mt. Angel and Stayton, except it was very light; that is a flat country, but between Niagara and the foot of what they call the mountain grade on the east side of the Cascades there was a ruling grade of two per cent. Niagara is on the Santiam River, I believe on the terminus of the present Corvallis & Eastern branch of the Southern Pacific Company. The distance between Niagara and Bend via this route is about eighty miles. The character of construction over this route is not difficult. (1463.)

The estimated cost of construction between Niagara and Bend is a little over five million; the total estimate of construction cost between Mt. Angel and Bend was about eight million dollars. The approximate cost per mile between Niagara and Bend would be roughly $80,000 a mile. There is a 50-mile section known as the mountain section that was estimated to cost five million dollars. From the foot of the grade on the east side of the mountains to Bend, a distance of thirty or forty miles, the construction would be very light; don't recall exactly but believe it was five or six hundred thousand dollars. There were neither tunnels nor large bridges required on that route. (1464.)

After getting down the mountain slope the territory between Hogg Pass and Bend is a rolling country, rather a slope; slopes toward the Creeked River—toward the Deschutes River; and the
810 slopes are rather gentle and the survey remarkably simple.

The natural resources tributary to this proposed line are principally timber from Stayton to Bend. As I recall Colonel Huson estimated about forty billion feet tributary to the survey between Niagara and Bend; I thought that some other roads might take some of that timber, so I cut the estimate to about twenty billion that was exclusively tributary to this particular line. I think the route described is an economic and practical route for the development of that twenty million feet of timber—about the best you can get in there. (1465.) I would say the logical outlet for the timber would be in both directions. This company had some proposed connection and they proposed to haul logs west and figured on hauling mostly finished lumber east.

I don't think there are any present plans for the development of that project.

The elevation of this line at the summit of Hogg Pass is between four and five thousand feet. Believe the snow conditions would be about the same as elsewhere in the Cascade Range. As to eastern outlets, if they built to Bend and stopped there they would only have the Union Pacific and the Oregon Trunk. The local promoters had not plans for a line east of Bend. (1466.) The Hogg Pass route was considered in conjunction with a route extending thence easterly. I should think such a route would be practical in conjunction with the cross-State line proposed by the Oregon Commission; I would think it would be, in connection with any line through central

Oregon. It would be practical to use it in connection with that broken line between Bend and the lake on down here [indicating on map]; Harney Lake, I guess it is. It would also be practical to use it in connection with a line extending to Crescent; it would
811 be an added distance. (1467.) The estimates of construction cost were made in 1920, pretty near the peak of construction prices. The grading costs now would be lower. It is my judgment that that is a feasible route for the outlet of that timber and for leading out of the Willamette Valley for a more direct route east as between Portland and central Oregon plateau. Naturally it would have to get out over some railroad and I know of no better route for that vicinity than the one down the Santiam River. (1468.)

Comr. McManamy. Mr. Ellis, just what is the purpose of this testimony in this proceeding?

Mr. Ellis. In the original case the examiner had suggested further consideration of various proposed locations for the east and west line. The commission in its report also suggested that it desired further information as to the most desirable location for the east and west line. The location will depend to some extent upon the possibilities for further extension and tapping timber west of our proposed terminus, and we feel the commission should have this information before it in order to properly determine the value of the two locations which are shown on our exhibits, the one going direct to Crescent, which Mr. Newell has recommended, and the one going through Bend, which he has also set up in his report and which some of these interveners are favoring. We simply want the commission to have all of the information available concerning the possible further extension and use of the line when it is once constructed.

Cross-examination:

I was not instrumental, by conference, consultation, or by actual field work, in fixing upon the route and location of the Port-
812 land & Southeastern Railway to Bend. (1469.) I formed no opinion in connection with my studies as to whether it was the route from central Oregon to western Oregon points, I was engaged to investigate and I considered this particular line a feasible route for the purpose but I made no comparison with any other route. I have no judgment on the question of whether the route, if one is made across the State, should be through the pass occupied by the Southern Pacific into Eugene, or through this Hogg Pass. With reference to the statement that it was the ambition of some of the promoters to go through to Salt Lake or Ogden and that Contact, Nev., was an important consideration, it was due to the fact that they having mining interests in Contact and it was one of the great traffic inducements for the construction of the road from Rogerson, Idaho, to Wells, Nev. (1470); I don't know whether the Contact mines have demonstrated that they are big producers or not.

I am aware of the fact that the Northern Pacific and Great Northern, through their ownership of the Oregon Electric, are now

building into the Santiam timber, east from Albany. I haven't gone into it very carefully. I thought they were on the other river, that is, the South Fork of the Santiam. Now whether that leads to Hogg Pass I can't tell you. It is the same general territory. (1471.)

There is a Southern Pacific track; I don't know whether it runs from Albany over to a town named Hoover.

Mr. Louis Hill, chairman of the board of the Great Northern, and his associates, own a great volume of that timber that is tributary to the Santiam. I don't know about the Weyerhaeusers' interests. (1472.)

Redirect examination:

The promoters of the line of railroad, discussed, contemplated using grade constructed in previous years; a part of the
813 Oregon Central and Eastern, I think, or Corvallis and Eastern it was at the time we made the investigation. There are about six miles they expected to use and as I recall it was built about 1888 or 1890. The company that originally built the grade, planned a line across the State. I think there was just a technical laying of rails on the section of the grade. (1473.)

ROBERT W. SAWYER was thereupon produced as a witness on behalf of the Bend intervenors, and, having been duly sworn, testified as follows:

Direct examination:

I have lived in Bend since October, 1912, and am editor of the Bend Bulletin; am also a member of the Oregon State Highway Commission; have been since August 1, 1927. Prior to that I was county judge of Deschutes County for about eight years. (1474.) During my residence and activities, mentioned above, I became very familiar with the local developments of the community. My business has made it necessary for me to become interested, not financially, but as a citizen. My experience as highway commissioner of the State familiarized me thoroughly with highway transportation. I have been attending the sessions of this hearing considerably.

My opinion, based on residence and knowledge of the needs of that particular section, are that Bend and country adjacent are now served by railroads, so that there is no absolute necessity for a cross-State line, but a cross-State line would be of great benefit in addition to the present roads (1475), because it would give a shorter, more direct outlet to eastern connections for a portion of the great volume of lumber tonnage that moves out of Bend, and for certain of the agricultural products developing there, that move east; also for sheep going from the ranges of central Oregon to the feed lots of Idaho. We frequently have stories in the Bulletin of the
814 large number of lambs being shipped from that section to Idaho for feed. It is my understanding the greater portion of the lamb production is shipped to Idaho; it is shipped down the

Deschutes River to the main line and then east and if a line were constructed across the State from Bend, it would reduce the mileage.

Bend is located on the Deschutes River, which river is from twenty-five to thirty miles from the summit of the cascades and the timbered area lies between the summit and the river. (1476.) There is a volume of timber adjacent to and millable at Bend. The Shevlin-Hixon Company and the Brooks-Scanlon Lumber Company produce, when running their regular rate of two shifts a day, between 160,000,000 and 180,000,000 feet apiece, per annum.

Referring to Bend's petition for an extension westward over the Hogg Pass into the Willamette Valley, it would afford an outlet for the timbered area lying to the northwest of Bend and on over through Santiam country; a more direct route for products of the northern Willamette Valley. As a layman, it occurs to me it might be of considerable advantage to the Union Pacific, during its times of tie-up in the Columbia Gorge on account of storm, to the extent it would stop traffic. (1477.) As to weather and snow conditions in Hogg Pass, there is snow there, probably the same amount of snow that you find anywhere at the elevation of about 4,600 feet, in the Cascades. It is my opinion the snow conditions there are better than on Natron cut-off. I have been on the present route of the highway from Sisters to Albany and on foot through Hogg Pass and over to Marion Lake and down to Detroit, and there is a considerable body of timber to the northwest of Sisters, of the western yellow pine, pinus ponderosa, and a less amount as you approach the summits and a considerable amount of hemlock, mountain hemlock.

West of the mountains are heavy growths of fir, found on
815 western slopes. (1478.) The road would be bordered by good stands of timber from close to Bend until you reach the farming section of Willamette Valley east of Albany except for this possible twenty to thirty miles, and between say Blue Lake on the east side of the Cascades and Big Meadows on the west side. There are no railroads penetrating that timber from the east side at present. I have been through that country and if this proposed cross-State road should be located north of the Public Service Commission's route and skirted the timber along the Blue Mountains in the Ochoco Forest lying between Burns and Bend there would be about a billion feet of western pine that would be available to such a line. I am not a railroad expert but believe you could skirt close enough to the timber so that it would be accessible.

Two surveys have been made across that portion of the State (1479) I understand one by the Oregon Trunk about 20 years or more ago and one by the so-called Oregon, California & Eastern from Bend to Millican, to Burns or some point between Burns and Crane. I was told the latter named line was a good line; can't say as to the Oregon Trunk. I have been through Fort Rock Valley a number of time and as to the irrigation experiments that have been made, I know they are getting water and producing very good

crops of alfalfa. (1480.) State geologists have demonstrated water is there, accepting power at reasonable rates, irrigation is very possible. I have had something to do with the promotion that has taken place in connection with the so-called Deschutes project. The Deschutes project covered the irrigation of four units of land lying in the Deschutes Basin north of Bend and three east of the Deschutes and one west of the Deschutes River, these projects to be irrigated by water stored in the Deschutes above Bend at the so-called Benham Falls Reservoir and diverted to the land
816 south of Bend—stored in Benham Falls Reservoir south of Bend and diverted to the land north of Bend. At the (1481) present time the effort is being made to secure Federal aid for the development particularly of the north unit of the Deschutes. I am chairman of the Deschutes Project Association, which is comprised of the commercial organizations and farm organizations of the valley promoting the enterprise and particularly in the securing of government aid. I have been to Washington in that regard several times. About 1921 or 1922, as I remember the date, an appropriation was made by the Congress for the beginning of the work. The appropriation lapsed. The work was not begun because of the attitude of the people of the north unit in regard to some of the conditions set up by the Bureau of Reclamation. Since that time, after the folly of that procedure was realized, we have been endeavoring to secure another appropriation. At the last session of Congress a bill authorizing an appropriation was favorably reported by both the House and Senate committees, and it passed the Senate and is now pending in the House.

Q. What area of land, or have you yet testified as to what area of land would be put under irrigation? (1482.)

A. The north unit, which is particularly being promoted at this time, contains for irrigation about 106,000 acres, according to the highest estimate, and something between 90 and 100, according to revised estimate suggested by bureau engineers.

That country is all in private ownership and largely now being farmed by dry farming methods for the production of wheat. It has not a very large population.

As to the snow conditions across central Oregon, between
817 Ontario and Bend, as compared with the snow conditions via the present route traversed by the O.-W. R. & N. line, I know about part of the route, and I have what I think is reliable information as to the rest. I think the snow conditions are much easier for railroad operation between Bend and Burns and Ontario than over the present Blue Mountain route.

Q. And would your statement in that regard apply over either route shown in the maps filed in this case, either direct to Bend or direct to Crescent?

A. I believe that in the vicinity of Crescent and for a short (1483) distance to the east there would be more extreme snow conditions

than from Bend to the east. It is a somewhat higher elevation and they have more winter there than we do.

In order of desirability, so far as snow is concerned, I would say that from Bend to the east would be number one, and Crescent number two, and the Blue Mountains number three. I think that is about it.

As to what extent the operations of the Oregon-Washington Railroad & Navigation Company over their existing lines are interfered with by snow conditions, in the Columbia Gorge, between Hood River and Troutdale possibly once in four years in my memory there has been complete inability to use the road because of snow or bad weather conditions, snow and ice. From over the Blue Mountains I simply know that they have much snow to handle during the winter. In going through I have seen plows at work and high banks of snow.

My connection with the highway commission causes me to be particularly familiar with the snow conditions in the Columbia Gorge and over the Blue Mountains. We find it necessary to main-
818 tain equipment and crews during winter months to keep our highway open (1484) over the Blue Mountains and to a less degree in the Columbia Gorge, because, so far as the highway commission is concerned, its jurisdiction extends only to the Multnomah County line. But I know the Multnomah County has a tremendous snow problem in the gorge.

As to what the highway department has done, or what it is doing along the line of highway construction in central Oregon adjacent to the proposed cross-State line, or in that general territory: The Dalles-California Highway, running from the Columbia River on the north to the California line on the south, is finished. The Central Oregon Highway, from Bend through Burns to Vale and Ontario, is on the State program, is under construction; that is, there are finished sections and more to be put on as our finances permit. The Fremont Highway running down to California from a mile or two south of Lapine, over into northern Lake County and by Fort Rock and Silver Lake and to Lakeview and the California line, is under construction. There are other highways, but those are the ones particularly in the territory to which you refer.

In my opinion the country across central Oregon is not a difficult country to build highways through. (1485.) We have just finished a 27-mile section on the Central Oregon Highway east of Bend, at an average cost of $2,200 a mile. That is for grading only —rather inexpensive.

I think I am familiar to some extent with the agricultural production of our section of the country.

As to the reasonableness of Mr. W. L. Teutsch's estimate in this case in his Exhibit No. 1, page 13, showing an estimate of present agricultural tonnage available for movement over the pro-
819 posed cross-State railway from Deschutes, Crook, Jefferson,

and Wheeler counties, totaling 312 cars, I could not give you any opinion on that subject from my own knowledge. I think a witness who will follow me has such information gathered from the local county agent.

Cross-examination:

Our grading of the mileage east from Bend on the highway was not substantially on the old highway location. It is somewhat to the north of the old highway location. That is, from the point we began east of Millican, running toward the half way point at Brookings; that is into the Hampton Valley. (1486.) That grading was begun last fall and finished I think in June of this last year. That is a comparatively level stretch along there. There is a little lava rock formation there. There was some rock work to be done. Lava rock is somewhat harder to handle than ordinary rock, where it occurs. This is largely open country from Fort Rock.

The highway route over the Cascades from Eugene to Bend is known as the McKenzie Highway over the McKenzie Pass. This last season it was closed to travel, as I remember, from (1487) the 9th of December to about the first of June. This is the first year an effort has been made to keep it open, that is to keep it open longer in the fall and open it early in the spring. An expenditure of about 10 thousand dollars was made to keep it open. I came across there on snowshoes in March, and there was then an average possibly of 8 to 10 feet of snow, but much more came during March and April. As to whether there is any such snowfall, or anything comparable with it in the Blue Mountains, on the Kamela Hill, I don't know; I think not, though. We keep our highway open all winter
820 there, our Oregon Trail Highway, and under much worse conditions also in other places. We have over 30 feet on the Sand Mountain Hill, on The Dalles-California. (1488.) We have kept that open for the last two years, since the work was begun.

Q. But you compared, I may have misunderstood you, the route from Bend to Ontario in central Oregon as presenting the least obstacle, as far as snowfall is concerned. Then, as I understood you, you said the route through the Cascades would be second?

A. No. The route from Crescent to the east, not through the Cascades to the west.

Q. Crescent to the east is right in the location that we are discussing, where you have the heaviest snowfall in the State, isn't it?

A. No; I think not. What I said to Mr. Ellis was that, in order of snow conditions, from Bend east was the most advantageous, from Crescent east next, and over the Blue Mountains third. I think from Crescent east we would be in practically the same snow conditions as we would from Bend east, except for perhaps the first 40 miles or so east from Crescent. There we encounter very heavy snow.

Q. As a matter of fact, some of your mills there at Bend found (1489) it impractical to locate any operation up at a higher elevation because of snow conditions, didn't they?

A. They located at Bend because of its greater desirability in the matter of snow and open weather, I understand.

Not to my knowledge did Shevlin-Hixon, or Brooks-Scanlon, actually purchase a millsite up some considerable miles south and west of Bend that they could not develop because of snow conditions.

821 They may have done so, but I didn't know of it. I think the Gilchrist Company bought a millsite near Lapine, but I never heard of either of the other companies doing it. Gilchrist is not operating. There is a great depth of snow up there at Crescent Lake, in the Southern Pacific operation. As between Crescent Lake and Blue Mountains I am not certain which is more severe. In the vicinity of Crescent Lake I would guess there was 8 to 10 or 12 feet of snow in the ordinary season; that is, total snowfall. I don't think there is ever that much snow on the ground at one time—that is (1490), in depth.

As to the difficulties of the Columbia Gorge, the snow conditions, that difficulty does not obtain every year. In 16 years there have been only four such instances. Any line operated into Bend by the O.-W. R. & N. or the Oregon Short Line would proceed down the Columbia River to go to Portland unless the route over the mountain, over the Hogg Pass, were built. We would not improve the Columbia River condition any by building from Crane or Burns to Bend. (1491.)

I was a witness in the Klamath Basin cases. I and the other people at Bend urged the extension of the Northern lines, or of the Great Northern, into Klamath Falls from Bend.

Q. And it is a fact, is it not, that the route over the Northern lines from Bend or from the Klamath Basin to the principal distributing centers for lumber in the East are practically as circuitous and as long as the present Southern Pacific route through Roseville?

A. It all depends on what you mean by "practically." I think it is somewhat farther by Roseville. I haven't the mileage in mind.

822 I consider the Northern Pacific and the Great Northern routes from Bend to the principal lumber consuming territories of the country fairly direct routes. That is, they reach, as I understand it, more largely the northern tier of States, and going up through Spokane they get into that territory. Of course, you remember that the Bend interest in the extension of the Great Northern (1492) was in order to get into California, chiefly, with its agricultural products, and to bring them into Bend, the California produce to Bend.

I think the Great Northern and Northern Pacific do not take out of Bend much more than 50 per cent of the lumber produced there. I think it is about an even break between the two lines of road. I think that traffic should be taken from them and turned over the

Union Pacific to carry over the cross-State line only so far as by so doing you would reach more directly the destination of their lumber. I believe that as they go to the northern tier of States the northern lines of traffic would not be served by this cross-State line.

Q. But you don't know what proportion of their lumber finally finds a destination in——

A. Well, we have figures here. I haven't in mind that, but we have tables showing all those figures.

I would urge that in so far as the cross-State line for lumber traffic is shorter from Bend the northern lines give up that traffic to the aid and support of the cross-State line. (1493.)

In the Klamath Basin case, before Mr. Mahaffie, I appeared as a witness for the Oregon Trunk, which I think was a petitioner asking for a certificate. That certificate was finally granted.

823 I should say that the public necessity in this case is greater than in the Klamath Basin case.

I think all of the O. W. R. & N. traffic that went through (1494) Ontario by the present route would go by the cross-State route and still through Ontario, and any of the Northern Line traffic that was destined to points south of what I understand to be their territory would also be diverted.

Comr. McMANAMY. Judge, am I correct in understanding that it is your attitude from your answers to Mr. Dey's and Mr. Rogers's questions that the real purpose in this case is service for the public rather than an equitable distribution of traffic as between carriers?

A. Oh; yes, sir; of course.

Comr. McMANAMY. Now, will you tell me something concerning the highway conditions in the central and south central part of the State, what the State is doing or proposing doing in the matter of developing its highways there?

A. As I have already said, the Dalles-California Highway, from the Columbia River on the north, running south through Madras, Redmond, Bend, Lapine, Crescent, near Fort Klamath, to Klamath Falls and the California line, is finished.

The John Day Highway, beginning with its Ochoco Highway connection at Redmond, is finished to the east as far as Mitchell, and a gap of about 35 miles is to be finished, and the section is now under construction—(1495) it is an even higher standard of construction than the John Day Highway. Our standards have improved since the John Day was built. The John Day Highway still on to the east is finished.

The Central Oregon Highway from Bend across the so-called high desert through Burns and out the Malheur Valley to Vale and Ontario has very little finished work on it, but it is on the State program and will be built as fast as funds are available.

824 From The Dalles-California Highway south to Lapine, the Fremont Highway runs via Fort Rock, the vicinity of Fort

Rock, Silver Lake, Paisley, Lakeview, to the California line, partly built, and to be finished as fast as possible.

From Lakeview to Klamath Falls a highway is all built, except for three sections, two of which are now under contract, and one section, about 10 miles, as I remember the distance, that is not yet provided for in any way, but that will be finished as soon as the money in hand. That is the State highway program in south central Oregon.

As to what is being done, other than advertising, towards the construction of the so-called Yellowstone cut-off from Lakeview across: The Yellowstone cut-off is in part over two State highways. That is, it runs in Oregon from the California line through Lakeview to Paisley on the Fremont Highway, which I have (1496) already referred to. From Paisley, on the Fremont Highway, running to the northeast to the Gap ranch on the Central Oregon Highway is about 85 miles, which the counties of Lake and Harney and interested organizations propose to improve. Then from the Gap ranch on east we are on the Central Oregon Highway again, which is on the State highway program.

Comr. McManamy. Now, when that program is reasonably completed, to what extent do you think it will serve the needs of that section of the State, that is, take care of its developments without additional railway construction?

A. It would take care of its passenger traffic, if I may describe it as such. But it couldn't handle shipments of a freight nature. In the first place, our laws as they now exist limit the weights that
825 may be traveled on highways, and the commission is interested always to see that the weights are kept within the carrying power of the highway without damage. So far as heavier cars are concerned, these highways will not be sufficient to provide for the development of that section of the State for carrying heavy freight. They will be largely limited to passenger travel and light trucking. (1497.)

Comr. McManamy. You haven't a very good highway from Burns down the Malheur River at the present time?

A. In starting on the other end the road is built from Ontario to Vale; then coming this way there is no construction anywhere on that line. There is a very good road from Burns to Crane, but that is possibly not to be on the final location. That is a matter now under consideration. Burns to the John Day Highway is not on the State program, but is being built by the counties and Federal aid through forest money. That is, it is a forest highway, being built by county funds and forest funds. Presumably it will some day be placed on the State system, but you can't spend State money on it now. It is partly built.

Comr. McManamy. Well, then, generally speaking, the program of the State highways which you have in mind will be pushed as rapidly as the funds are available?

A. Yes, sir.

The State Highway Commission has spent since the program was begun in 1917, the total expenditures, about $115,000,000. Those are the total expenditures made on the State system. Now, that is made up of county contributions, proceeds of the sale of bonds, gas-tax income, motor vehicle-license fees, and Federal aid. That $115,000,000 expended since 1917 does not include the expenditure made by Multnomah County in the construction from Portland up the Columbia River Gorge to Bonneyville, as the county
826 line. No State funds, by law are expended in Multnomah County.

Q. So, as a matter of fact, in western Oregon there have been very large expenditures on highways, running into millions of dollars in excess of this hundred and fifteen million; isn't that true?

A. Not on the State system. You understand, the Mutnomah highways are not on the State system. (1499.) Of course there have been many millions of dollars on the so-called market roads and other county roads, but not on the State systems.

Q. And during this entire progress this undeveloped center of the State, without rail transportation, has just languished and gone along without any State aid to speak of, and without any interests or money for highway construction; isn't that true?

A. The sections of the highways in central and eastern Oregon have been under construction at various times since 1917.

Q. Yes; but in just a little, small, indifferent way; isn't that true?

A. Well, I would hardly call it indifferent. We have been promoting the Dalles-California, for instance. We were not paralleling the railroads all the way when construction was begun. Of course, the Great Northern has come in since. The central Oregon Highway parallels no railroad whatever. The Fremont Highway parallels no railway except south of Lakeview. They haven't been built; no. (1500.)

Q. But that is the prospect for the railroad to look to as far as passenger traffic is concerned, and light freight traffic, isn't it, that they will be built as soon as the railroads are built in there?

A. Not as to passengers, the way I look at it, because the
827 railroad companies, as far as they are concerned, are developing their own bus systems.

Q. Well, they don't need any cross-State line to operate the bus if you will build us the road.

A. The Great Northern is now starting buses down the Dalles-California. I suppose you would put them on the central Oregon.

Q. Now, as a matter of fact, though, there haven't been any highways in central Oregon in a long, continuous section, except this Dalles-California Highway that runs between Bend and Klamath Falls; isn't that true?

A. Well, the Ochoco Highway, or, if you start at the summit of the Cascades, the McKenzie Highway, on down through Redmond

and over to Mitchell, is continuous construction, carried on all this time. There hasn't been continuous construction on the central Oregon or on the Fremont. (1501.)

Q. The scenic route isn't presented or afforded over in central Oregon. The so-called high desert don't attract the tourist at all, and won't if you construct highways, will it?

A. Not possibly for local interest, but as a means of through travel, yes. Of course, there are other reasons why that construction hasn't gone forward, not because there is no scenery.

Q. Why haven't they constructed over there where rail transportation isn't afforded and expended their money over here in western Oregon and on the Columbia River?

A. As to western Oregon, the law requires the expenditure of a certain large percentage on this side of the mountains. As to central Oregon, no construction on the central Oregon Highway, for instance, because the money was being concentrated on the Dalles-California. It is now that we have finished the
828 Dalles-California that we are turning to the central Oregon.

As to the Fremont, the highway commission has until last year declined to do anything there because of the uncertainty as to possible railroad routes and its desire to establish the line where it would give the best service with respect to railroad construction. It was only after the Great Northern decision that the location north of Fort Rock (1502) was determined. The highway commission thought the Fort Rock location was related to the Great Northern location. That was before I was on it, and I disagreed with them. I am, I trust, not using any position I have to promote the particular interest of the community where I live. Now, that the location is selected, we are securing aid from the Forest Service in building the line through there, and can go on with it.

It is my belief that these highways wouldn't be any considerable factor in the accommodation of traffic in a freight way.

Q. Now, don't they use those highways over there in eastern Oregon, and won't they use them, in the same way they do in western Oregon in the handling of freight?

A. What I call light freight. If you want carrying out 20 or 30 tons a day of soda ash, or large weights of hay or (1503) cattle—I call canned goods light freight as distinguished from commodities like hay.

Q. Now, it appears from the record that as far south as Roseburg and farther south, canned goods packed here in the Willamette Valley are taken by truck to Portland for shipment by water. Now, you are familiar with the trucks that they operate on the Pacific Highway through the Willamette Valley and on south clear to the California line, are you not, judge?

829 A. Yes. They are coupled up tandem. I think they present the appearance of small box cars on rubber, and do really function in a very important way in the handling of the freight business of the country.

As to the limits to the trucking load that obtain, for instance, on the Pacific Highway, I don't remember the exact figures, but they have to do, as I remember, with the width of the rubber tire. We have our solid tire and pneumatic tire regulations.

Q. And if they can comply with that tire requirement, why, (1504) load and vehicle run up to some 16 or 18 tons, do they not?

A. I don't know that. I would take your word for it. I think that sum is a little high. Of course, that is on hard surface at all times. The commission frequently reduces the load limit on macadam roads during the winter time. None of the central Oregon roads are hard-surfaced. The road from Bend to Klamath is not hard-surfaced. It is an oiled macadam. The road in the John Day country is not hard-surfaced. There is no hard surface in eastern Oregon except on the old Oregon Trail and the Oregon-Washington Highway in the vicinity of Pendleton, if my memory is correct.

Redirect examination:

All the freight out of central Oregon, I would say the most of it is long distance, heavy freight, lumber (1505) chiefly, potatoes, livestock and some hay.

Recross-examination:

I mentioned the attractive feature of taking this Bend traffic east across the cross-State line, particularly as far as
830 the O. W. R. & N. operation was concerned, to the end that it would be delivered on a shorter route at Ontario than via the present route. Lumber is practically all there is there, from a traffic standpoint, for long distance movement.

Q. Now, I suppose in this cross-State line, as far as the Bend operation is concerned, you would consider the absorption of the investment of the O. W. R. & N. in its line up the Des Chutes?

A. Of course, we feel that there was unfortunate and unnecessary duplication of investment in the Des Chutes. The companies themselves have been absorbing as they have torn up the tracks in some sections there and consolidated. (1506.) Whether or not the commission would feel it was necessary to carry that to its end——

Q. Now, you say "the companies"—you mean by that the fact that the Oregon Trunk, that built up there at the same time that the Oregon-Washington Railroad & Navigation Company built up there, has abandoned some 28 or 29 miles of its original construction; that is all that has been abandoned, isn't it?

A. I believe so, yes. I think there is joint operation there, now, substantially half the distance of the Canyon from the Columbia River to Bend. The companies as between themselves that are in that joint operation are committed to very definite and substantial contracts over a long period of years, naturally.

Q. And the obligations they have to pay. You know that the Oregon-Washington Railroad & Navigation Company, for instance, operates on 40 or 50 miles of the Oregon Trunk, and the Oregon

Trunk operates on about the same mileage of the Oregon-Washington Railroad & Navigation Company?

831 A. I take your word for that. I don't know the distance. I know that there is substantial mileage there used one (1507) company by the other. I assume those obligations will continue. If the Oregon-Washington Railroad & Navigation Company would build from Bend across the State to Ontario it wouldn't avoid its existing obligations.

Q. In other words, it would have no necessity or use for any line, either jointly or individually, in the Deschutes Canyon, that is true, isn't it?

A. Shipments originating in Portland, if the line weren't built to the northwest from Bend, would have to come up the Deschutes Canyon. I am not thoroughly familiar with your lines, but any diversions north of Pendleton, I assume, would still go down the Des Chutes. Bend does not have very extensive relations with eastern Washington territory and Spokane.

Q. Now, you are so familiar with this area at Bend, and there was one question I think that the commission would be much interested in, and I should have asked it before, but it is with respect to the timber supply for the Bend mills. Those (1508) are large milling institutions, aren't they?

A. They are, yes. They involve many millions in investment. As to how far south they will go along the east slope of the Cascade Mountains for their timber supply, the Shevlin-Hixon Company or affiliated companies own timber 50 miles or more south of Bend which it expects to mill at Bend. The Brooks-Scanlon Company is already, I think, that distance south of Bend, to the east, with its logging road. Whether or not they will go beyond that I don't know.

By highway from Bend to Klamath Falls it is about 150 miles. The Klamath Falls mills will be as large operators, in the

832 aggregate, and probably a little larger, than the Bend mill when Weyerhaeuser gets going in Klamath Falls, but at present the Klamath production is only a very small amount more than the production of the two Bend mills. There is only a few of the Klamath people who own their (1509) own timber. They buy logs down there, and they are getting logs now on the Great Northern up in the vicinity of Crescent, and, of course, in the whole timbered area around Klamath Falls. The Pelican Bay Lumber Company, and the Weyerhaeuser Company, and the Shaw-Bertram Company, through the forest, purchase their logs.

Q. The point I am making is that irrespective of the ownership of that timber north of Klamath Falls, it is a resource for Klamath Falls to call upon to continue its operations?

A. Not exclusively, if you mean that. It is a resource, an area from which they would draw their logs. The Bend people would draw theirs going south, but not exclusively. Klamath will come

north and Bend will go south. But each section has other territories in other compass directions from which to draw timber or lumber. I do not thing there is very much lumber between Bend and Klamath Falls that can not be marketed, manufactured into lumber, in one of the cities or the other. (151.0)

Without regard to supply, I would say there is no justification, on account of weather conditions, for a large milling operation in that pine belt between Bend and Klamath Falls at any intervening point. Assuming that the weather conditions permitted, there wouldn't be any justification only so far as you could secure your supply from the Forest Service, national forest timber, such as the Shaw-Bertram Company in their recent purchase near Corral
833 Springs. That is not far from Chemult. That is a pine stand, spinus ponderosa. The national forest area timber runs all up and down the east slope of the Cascades. It is being called upon by the operators at Bend and Klamath Falls. (1511.) You wouldn't want to operate a mill on the slopes of the mountains there. The logs would be hauled into Bend or Klamath Falls.

It is true that there is now being hauled, on the line that the Great Northern owns north of Chemult, logs to the mills in the Klamath center, a hundred miles or so.

Further redirect examination:

I think I heard the testimony of the witness from Lakeview, Mr. Nolte, concerning the possibility or probability of establishing a mill cite in Northern Lake County, in the vicinity of Silver Lake. (1512.) I think that would be possible, although possibly not the best use of the timber of that vicinity.

Q. Doesn't the territory there slope generally in an easterly direction toward Silver Lake?

A. The Walker Range of Mountains, which lies between the present Southern Pacific line and the Great Northern line and the Fort Rock Valley slopes on the east side to the east.

Q. And if it is the policy of the forestry officials of the United States Government to require the milling of forest reserve timber within the county in which it is located, it is reasonable to suppose, is it, that some of the timber of Lake County would be milled where Mr. Nolte suggested?

A. Yes.

834 Further recross-examination:

I think the ownership of the mill at Bend extends into Northern Lake County. They expect to mill some of that Lake County timber right up to our place at Bend. (1513.)

Comr. McManamy. There has been considerable testimony in this case with respect to the rate of production of timber and its development in Oregon as compared with Washington. In your judgment what is the reason for that taking into consideration the fact that the testimony also seems to be that within the last few years there

has been no car shortage that so far as the lines now within the State are concerned they are efficiently operated and render service? Is it a question of reserving large timber supplies for certain mills or certain communities or is it a question of the need for competitive service or is it a question of the lack of branch line or feeder service? In your judgment if you care to express an opinion on the particular question as to why that condition which apparently does exist should exist what is back of it?

A. Well so far as Washington is concerned I would say that their timber development, logging, milling, sawmilling development, has been largely fostered and created by the transportation facilities afforded by the water of Puget Sound to which their logs are very easily transported. In the central port of Washington I am not familiar, although it is my understanding that the sections there of an irrigated country have been largely aided in their (1514) development by transportation, and I would say that this portion of Oregon here would have been benefited by transportation. I think
835 competitive conditions in the Willamette Valley have not been possibly what the public interest would most desire, but in central Oregon I believe we would have had greater development with a cross-State line. I am not sure that that is responsive.

Further redirect examination:

Q. (By Mr. DeArmond.) If the transportation facilities had been provided, say, 10 or 15 years ago, in your opinion (1515) wouldn't the State, that section of it, have been very much more developed than it is now?

A. I think so. Perhaps I should have answered you that way. (1516.)

L. K. Cramb was thereupon produced as a witness on behalf of the Bend intervenors, and, having been duly sworn, testified as follows:

Direct examination:

I live at Bend. I am secretary of the chamber of commerce at Bend. I have held that position three years. As secretary of the chamber of commerce at Bend it has been necessary for me to familiarize myself with the resources of the county and central Oregon communities; and of the transportation requirements. (1517.) Bend has a population of 10,000. Deschutes County has a population of about 16,000. I am appearing here for the city of Bend and the Bend Chamber of Commerce.

The general opinion in that county as to the building of the cross-State road as proposed is that it would aid in the development of central Oregon.

I have prepared an exhibit to be used in this hearing. That
836 is the exhibit. Those are all mimeographed copies, all the same. (1518.)

(The document so offered and received was thereupon marked "Interveners' Exhibit No. 24, Witness Cramb.")

Ordinarily as this exhibit is prepared I think it explains itself. That is the intention.

Page 8 shows the distribution of the lumber shipments going out of Bend as to destination. It shows the shipments for 1927 of cars by States. An analysis of this is given on page 9, which shows approximately 60 per cent of the lumber shipments from Bend go east of the Mississippi River and that nearly 19 per cent are along the lines of the Union Pacific, which, together with the shipments east of the Mississippi River, would be brought approximately 200 miles nearer Bend by the construction of a cross-State line from Bend to Crane. All of the lumber shipments out of Bend for the year 1927 are shown on page 8. This, by the way, is lower than the shipments for the two years preceding, and lower by (1519) possibly three or four thousand cars, than those this year will be. The showing for this year shows an increase over last year so far—almost a 50 per cent increase. That is shown on page 9.

I think the O.-W. handles about 40 per cent of the cars originating in Bend, and the Northern lines about 60 per cent. That is my recollection. As to how the 40 per cent moves, I haven't separated that as to the two trunk lines. I would have to go to the records of the two companies to get it. I could furnish it; if it is material I will get that for you. I will say this, however, Mr. Examiner: That the two (1520) lines are on a parity to Chicago, and shipments east of the Mississippi River, and it is about the same distance over
837 the Northern lines as it is over the Union Pacific at present.

As to where this 40 per cent of the shipments go that are originated by the O.-W., I am going back to Bend in the morning and I can furnish it to you.

I have a map of the United States showing those lumber shipments. I didn't intend to insert it as an exhibit, although it may be done, if you insist, if you want this. This map here shows the distribution of 1927 [exhibiting map]. It is the only map I have. (1521.)

I have a map prepared by me showing the shipments by cars, and the destination as to States from Bend. I have that map with me. The same information is also shown on page 9, in the analysis. I got my information concerning those shipments from the two lumber companies in Bend. (1522.) That is the Shevlin-Hixon and the Brooks-Scanlon Lumber companies.

As to page 10 of my Exhibit No. 24, under section 2, under the head of paper pulp: The use of western yellow pine and lodgepole for the purpose of making pulp and paper has been investigated thoroughly by United States Forest Laboratory at Madison, Wisconsin, and also by engineers for the Brooks-Scanlon Lumber Company, and it makes a very fine quality of heavy kraft paper, useful for wrapping purposes and for bag purposes, where great strength is required. As shown on page 10, Brooks-Scanlon Lumber Company went into this quite in detail two years ago, and I understand

still have under consideration the feasibility of establishing a pulp mill in Bend of approximately 200-ton capacity, daily capacity.

Q. On that same page you go into the question of agriculture and livestock to some extent. Taking into consideration the report
838 of Mr. Teutsch, I think contained in exhibit 1, what would you say as to the figures given by him as to the amount of tonnage that will go over the new proposed road?

A. His figures on clover seed and sheep and wool were very conservative, and he did not mention turkeys and eggs at all. (1523.) Two years ago no clover seed were shipped out of central Oregon. Last year four cars, of which I think three cars went east, were shipped. This year it is estimated six or seven cars will go out. It is entirely probable that within five years the production will be greater than Mr. Teutsch estimated.

As to sheep and wool he does not estimate any increase during the next five years, and I think with the increasing number of acres being brought into cultivation and the increasing number of farmers who are raising farm flocks of sheep, that that will be increased quite materially.

Three years ago it was necessary to import eggs into Bend for local consumption. During the past 12 months seven cars of eggs were shipped out, all of which went ultimately to the East. The central Oregon country seems to be peculiarly adapted to the poultry industry. Those who have investigated, men from the State college, say that it is better suited than is the Petaluma district in California, and we ultimately expect that shipments will increase rapidly.

On page 10 is mentioned turkey shipments, which Mr. (1524.) Teutsch did not consider. Three and a half cars went out last year, six to eight will go out this year. The market for turkeys is entirely in the East.

As to page 11, under the head of diatomite: There is some mined there at the present time. There is a mine at Lower Bridge,
839 west of Terrebonne about 25 or 30 miles from Bend. At the present time, according to the managing director, they are shipping out about 10 cars monthly. The manager of that concern expects the car shipments to increase quite rapidly. Diatomite has been commercially used only about 15 years. Fifteen years ago 40 cars were consumed in the entire United States, and last year 10,000 cars were shipped from the various mines. The mine near Bend is of a very high quality diatomite, very white and pure and fine and light. That mine is being operated now. (1525.) The managing directors says that 90 per cent of this is used in the East and will go East.

I think the mileage tables set out on page 12 are self-explanatory. They have been pretty well checked. On page 12 they show the distance from Eugene to Granger, St. Louis, and Chicago, showing the saving the line proposed by the public service commission would make to Chicago over present lines, and also the saving from

Eugene going to Bend and on that line to Chicago. The distance from Eugene to Chicago would be about 36 miles farther going by the Bend line. This, however, will be reduced three or four miles by the construction of about 12 miles of road from Bend south and the abandonment of part of the Shevlin-Hixon logging road, which is very circuitous for that distance.

On page 14, at the top of the page, is shown saving in mileage from Bend in the construction of a line from Bend to Crane. I think that is self-explanatory.

On page 15 is given the elevations, as far as we are able to (1526) get, between Bend and Crane, showing that it is not a difficult country in which to construct a railroad as compared with the elevations below, over the Blue Mountains, which are not
840 only high but quick ascent from one point to another. In other words, it is not only the question of saving in mileage that should be taken into consideration, but the saving in cost of operating the train over that given mileage.

As to the accessibility to the timber lying between Prineville and Burns if this route were selected for the construction of a cross-State line: The timber in what is known as the Mora Mountain section, that is part of the Ochoco timber, south of the Ochoco timber, amounting to about a billion feet, would be 15 or 20 miles from the line. The timber in the Ochoco Forest north of the Crooked River Canyon would be 10 or 15 miles farther, which is less than either one of the companies in Bend is now going for timber.

When I said that the lumber mills at Bend to Chicago were on a parity via the Union Pacific system lines and the Northern lines I meant the distance and not a rate parity. (1527.)

Q. On page 1 of your exhibit, in your introductory statement, it is said that, "A railroad from Bend to Crane offers all the advantages of a road from Crane to Crescent Lake and will serve the State better." Does your testimony, giving the views of the interests for which you speak, contend here only for the construction of a railroad from Crane to Bend?

A. The ultimate destination to Albany. That should be taken into consideration, I think. At the present time Bend and people for whom I am speaking, are interested in merely the construction of a line of railroad from Crane to Bend. That would not serve the same purpose as the Oregon commission's proposed line, which would connect Crane with the Southern Pacific line's Natron cut-off. And Bend could also be connected with the Southern Pacific's line at Crescent Lake. There is a road now from Bend south.
841 Q. But that further connection from Bend over to the Southern Pacific is not part of what the interests for which you speak are advocating here? (1528.)

A. In order to serve the western part of the State, that would be necessary, or the building of a line from Bend to Albany. The construction of a line from Bend to Crane would serve our interests.

Q. Now on page 9 you have a paragraph analyzing these lumber shipments from the Bend mills east. I note that a great proportion of those shipments move to points on and east of the Mississippi River. What importance, if you know, do the lumber mills and the people engaged in the manufacture and shipping of lumber from Bend, in the light of the long distances to which lumber from Bend moves to market in the East, attach to a possible shortening of the routes for the movement of this lumber and a lessening of the time in transit?

A. The retail lumber yards at the present time order their lumber more hand to mouth; that is, they order as they need, and a shorter route would be of valuable assistance to get that lumber.

As to whether the lumber mills at Bend, in shipping into the eastern markets, are there in competition with any other lumber producers nearer those eastern markets than Bend is, would say the southern production is nearer, but that is being rapidly exhausted. It is the opinion of the managers of the Bend mills (1529) that the eastern market will consume more western lumber in the future than it has in the past.

On page 12 I have stated that the saving in distance to east-
842 ern points via the public service commission's proposed line is 36 miles less than via the Bend line to the same points. In making those computations I used the distances from folders of the different companies and from Crescent Lake I used a distance of 24 miles to a point about 41 miles south of Bend on the Great Northern, and that was furnished to me in a letter by Mr. Corey to the editor of the Bend Bulletin as an alternative route. Over to Crane I used the distance 41 miles from a point south of Bend and then the Bend line over. On the Bend line over I showed a distance of 157 miles. I think Mr. Newell states some place that the distance would be 35 miles farther by Bend. I saw that came (1530) out in the testimony here somewhere. Is that right?

Q. I have just made a computation from the map. The figures on the map indicate that the distance would be 42. However, it is a fact that the line via Bend to eastern destinations would be 36 or 42 miles, whatever the correct figure may be, longer than the distance from Crescent Lake over to Crane?

A. Yes; originating at Eugene. On the other hand, the heavy traffic would be from Eugene east, not the other way, and it would be on a down-grade haul from Crescent Lake to Bend, which would make some difference.

In view of greater tonnage near the Bend line, and the fact that the Bend line offers a shorter route from Albany, I think the Bend line would serve the purpose as adequately as the route suggested by the commission. Eugene is not the only town to be considered in Oregon (1531) in building a railroad.

843 Cross-examination:

Referring to page 2, estimates on farm values, land alone, and buildings. The estimates in the first two columns were taken from the Federal Government records, and the third column is based on estimates the county agent and I gave. I think there has been $400,000 worth of construction there from January 1st, 1925, to January 1st, 1928.

As to the estimate farther down in regard to wheat, that is, 36,000 bushels for 1928 and 10,718 bushels produced in 1925: Those are figures that we obtained from estimates by the county agent, and he is familiar with the wheat production in Deschutes County. Since 1925 the wheat acreage (1532) in Deschutes County has increased about 500 acres. That is one of the county agent's estimates. (1533.)

Q. (By Mr. SPENCER.) Now, you produced on 1,166 acres of wheat in 1920, by the Government returns, 14,684 bushels. The county agent estimates production of 1,200 acres or only just 34 acres more, he expects a production of 36,000. Now, what is that?

A. The production in 1920 was largely on dry farming east of Bend, a very small production per acre, while the production in the year 1927 was largely on irrigated land, with a high production per acre.

A part of the hay production in 1919 was on irrigated areas. To my knowledge we never had any hay production up there on dry farms. I don't know.

Q. And, as a matter of fact, your acreage shrank from 1920, from 24 or 25 thousand to 19,000 in 1925, and you shrink it again in your estimate for 1928, yet you have got your production from 18,000 in 1928 estimated at 54,000 tons, whereas on 7,000 more acres in 1920 you only produced 36,000 tons.

844 A. I think that is correct. The production per acre has been increasing there. (1534.) It is a better method of farming. That is only 3 tons to the acre in 1927, and that isn't a high production for alfalfa hay. McDonald, the county agent, gave me his estimates. We went over them together.

There has been such an increase in acreage in potatoes. We have been a potato shipping section for years. I have only been there for three years, and they have shipped potatoes during the time I was there.

Q. But you shipped potatoes amounting to about 80 or 85 thousand bushels, from 1920 to 1925, but here (1535) you have it estimated for 1928 that you are going to ship out 410,000 bushels.

A. That is not what we are going to ship out. That is the total production. I think that is correct. There was a very large acreage of potatoes last year, and an equally large acreage this year.

Q. But you have got more than twice the production to the acreage. You increase the acreage a hundred per cent, and then you in-

crease the production more than 200 per cent. Does that impress you at all?

A. There has been an increase in the production per acre.

Q. There hasn't been any increase of over 200 per cent, has there?

A. I don't know whether this shows that. I haven't figured it up.

The irrigation projects up there are all tributary to Bend. The central Oregon irrigation district has 9,804 acres in Crook County out of the 48,549; the rest is in Deschutes County. The proj-
845 ect that there was so much trouble with (1536) over there in the leakage of the reservoir is the project just below that. That is the Tumalo—the Deschutes County municipal improvement district, the second one on the list. That is operative; about 6,500 acres now in cultivation. They raise on it the same as on the other projects—alfalfa, clover seed, potatoes, and some wheat. They are not dependent on that so-called leaky reservoir for water.

Q. They have got irrigable acres, 15,000, if they can get water for it, is that it?

A. They have water for it.

Q. They have been there for years and have only got 6,500 acres of it in cultivation?

A. That is a question of colonization, not a question of water.

The Deschutes reclamation irrigation district is immediately north of Bend. The Arnold irrigation district is south and southeast of Bend. It adjoins Bend on the southeast there. (1537.) The water rights on the Arnold district are now up to the Supreme Court for adjudication. The whole river is under adjudication, but that applies to that. There are about 2,000 acres of the Arnold irrigation district in cultivation.

The Squaw Creek irrigation district is northwest of Bend, up near Sisters. That is all privately owned and all under cultivation. I think that is a State project. I wouldn't be absolutely certain as to that.

The Snow Creek irrigation district is between Bend and Sisters. About 1,100 acres of that are under cultivation. There are enough settlers to cultivate those 1,100 acres.

Q. Free water rights, number of acres, 7,000—where's there (1538) any free water rights over there?

846 A. Well, there are a number of farms over there watered from springs, and so forth. These are all within a short radius of Bend. They are accessible by highways. They are now enjoying service by three transcontinental railroads. I think there is a truck line operated there to Portland. I am not sure as to that.

I think timber holdings further south than Crescent are held by the Bend mills, that they manufacture at Bend.

The forest timber I referred to there that is accessible for Bend, some of it is west of Bend (1539) and some is southeast of Bend. Timber in the vicinity of Paulina Mountains is southeast of Bend.

I think there is some southwest. There is some national forest timber southeast of Bend.

Q. Now, you have in this classification pretty near a billion feet in lodgepole pine; that is what they call a black pine, is it?

A. I don't know what they call it. I expect they call it lodgepole. It is a very tall tree. I think probably the principal use of it would eventually be in the manufacture of pulp. (1540.) They are not using any of it now. Most of the lodgepole pine is in the higher areas.

Q. Now, a cross-State line, referring to this timber over here on the slopes and on the ridge of the mountain west of Prineville and west of Bend, I notice on page 7 you refer to the Ochoco National Forest, approximately 5 billion feet, that wouldn't be served by a cross-State line as located by the petition in this case, would it?

A. Not directly by the public service commission proposed line, no. The Mora Mountain timber would probably be 10 or 15
847 miles from it, and the other timber possibly 25 to 50 miles. (1541.) If we get as close as we can to the base of the mountain on the line between the desert and the mountain we will be a full 50 miles from the heavy timber on the ridge of the Blue Mountains along there. I couldn't say if it would be more than that. It is considered a rugged country, the Ochoco region.

Q. I mean, you would have a big drop from that location down to your proposed railroad?

A. I don't know what you would call a big drop. A railroad there at an elevation of about 3,600 feet along in there.

Q. And at the top of this is about 5,400 or 5,500 feet, isn't it, the top of this mountain there, where the timber is?

A. I don't think they would get a great deal of timber right on the top of the mountains. It would be all down on the slopes, at the various levels. The top of the mountain is not the heaviest timber at Bend. As to whether it is on the ridge east of Prineville, I couldn't say. I have never been there.

Q. Well, as a practical matter, this cross-State line, the public service commission line, as it is conceived, to serve the pine forests east of Prineville wouldn't be very helpful in that direction, would it? (1542.)

A. It would be helpful in this respect—it would make a closer connection to the East than the present line, of the manufactured timber. That is true as far as a logging operation is concerned.

Q. You could get into this Ochoco forest from Burns to-day with practically as short mileage as you could from the location of the cross-State line to Crescent?

A. The road from Burns to Seneca, as I recall, is 50 miles; that is straight east of Prineville.

848 Q. This estimate here for agriculture and livestock on page 10 contemplates moving it across that State-line, does it?

A. The market for clover seed and sheep and wool will move across the cross-State line. The market for clover seed is in the East. It moves out over the railroads that are in there now. (1543.) The sheep move to the Idaho range. They would go the cross-State line. I think most of the wool goes to the eastern markets. As to whether all the wool in that country has been coming down into the wool pool at Portland for several years past and moved out by water, I couldn't say as to that. We haul diadomite about six or seven miles to the railroad now. I don't know the specific points where it is shipped. It is shipped wherever there is a demand for it. Mr. Kreiger, managing director of the Diadomite Corporation, gave me the estimate of 10 cars a month. He says the present shipments are approximately that. (1544.) He says 90 per cent go East. As to whether they ship them to Portland and send them East by water, I couldn't say as to that. I have heard that there are other diadomite deposits in the State and some in California. I understand there is a deposit at Harper, on the Oregon Eastern, which isn't pure and not as light as the deposit at Terrebonne, and not as great a demand. The people that operate that don't like to admit it. I don't know whether or not there are a lot of diadomite deposits over in Idaho. I don't think there are a great lot of those deposits. I couldn't say. I know there is a deposit in California. I don't know (1545) where.

This commodity is used for infiltration and insulation. The more recent use and the more extensive use is in concrete. It
849 adds to the strength of the concrete, and by the use of diadomite with concrete it isn't necessary to use so much water, and the pouring quality of the concrete is increased. It seems to pour easier, and then the ingredients don't separate as much in concrete. I understand that quite a large quantity of diadomite is used in the wall here in the port of Portland. Is is also used to some extent in plaster and mortar.

That deposit is north of Bend. There is no reason why it couldn't operate at all periods of the year. If there isn't a market demand for it it won't operate, but the demand is increasing, particularly in the use of concrete. I don't know for a certainty whether it is operating all the time of not. (1546.)

Q. On page 15, these distances, I don't know as I know what you mean here, "elevations over Blue Mountains," and then you have got "distance to next place." Sherman is 170, Arlington 225—those are elevations—and the distance, I assume, from Sherman to Arlington——

A. 36 miles. That is 170 at Sherman, the elevation above sea level. I start my calculations at Sherman. We start to climb a mountain at Pendleton.

Referring to page 2: The great amount of agricultural products would be loaded at Redmond, in Deschutes County (1547), which is 18 miles north of Bend.

Referring to page 12: When I say with reference to distances to Chicago—taking the item where it says 36 miles over public service commission line, that is calculated from Eugene. You see at the top of the page there that's the figures from Eugene; that's the distance.

Q. Well, in computing your saving on Bend shipments going east by the various routes, what did you base the calculations on
850 as to the cross-State line as proposed in this case?

A. I believe that is the line proposed by Bend, from Bend direct to Crane, 157 miles. On the public service commission proposed line we computed the distance as going from Bend to a connection with the cross-State line and then east. (1548.)

M. B. BERGSVIK was thereupon produced as a witness on behalf of complainants, and, having been first duly sworn, testified as follows:

Direct examination:

I reside in Portland, Oregon. I am car distributor, Chevrolet Motor Company, for the northern part of California, all of Oregon, western Washington, and western Idaho. I have held that position five years. In the distribution of our cars to eastern Oregon and southwestern Idaho, they are shipped from Melrose, California. The cars are assembled in Melrose and shipped to the dealers. I estimate 500 carloads will be shipped annually into southwestern Idaho and eastern Oregon. (1550.)

As to the routing of railroad cars of automobiles, the routing is all handled with the traffic department in Oakland, but the company that gives the best service, and the rates naturally are the same, and furnish the equipment and saving of time, it is more natural that they get the business, but they always try to give all the roads a proportion of the shipments going into that part of the country. We ship now into southwestern Idaho from Melrose to Portland and from Portland through. I don't think we ship any by way of Ogden, nor any by the famous Rogerson-Wells cut-off. It takes about eight days to ship a car from Melrose, Calif., to Boise. Melrose
851 is six miles out from Oakland. It is where the factory is located. (1551.)

Cross-examination:

Our cars come through Portland and East Portland for this eastern Oregon territory. The diverting and routing of the cars is handled by the traffic department in Oakland.

I do not know where the territory divides in southern Idaho as between Portland and as between the Central Pacific service, but I think it is outside of our territory. I think it is east of Glenn's Ferry. I know when we had the Montana territory we used to ship over Ogden into Butte, that way but that is about the only one I think that we did ship. We shipped from Oakland up through Pocatello and up to Butte that way. (1552.)

We ship around 40 cars of automobiles a year into Crane and about 60 or 70 into Burns. We put four automobiles in a car.

Q. Now, there wouldn't be any inducement or help to you or your company or to the shipper if the rate was the same to those destinations in eastern Oregon and southern Idaho, would there?

A. Well, if the route is so much shorter, it would, yes; and the rates are the same.

Q. Well, does the shortness of the route always determine the time consumed in going over it?

A. That is what I mean, time would have to be taken into consideration, also, you know.

Q. You would go by main line operation in preference to a branch line operation, wouldn't you?

A. Whatever makes the best time. Now, you see, anything like that would have to be handled by the traffic department, you know. (1553.)

852 Q. If you didn't get a lower rate to Ontario, for instance, via this cross-State line, or if the other rate was lower, the other route had a lower rate, why, you would ship via the other route, wouldn't you?

A. That is what it seems to me; yes, sir.

Those 500 carloads that would move into southwestern Idaho, that will be from August 1st up until August 1st of the next year. I couldn't give an estimate of what percentage of those 500 carloads would move over this proposed line. Now, there might be more than 500. I am just giving you an estimate of what I figure would go in there. If things are going like they are now there would be more than that. That includes Ontario only. That is right beyond the line there. Leaves off Glenn's Ferry and takes in Burns and Crane. (1554.)

W. H. DOOLITTLE was thereupon produced as a witness on behalf of complainants, and, having been first duly sworn, testified as follows:

Direct examination:

I reside at Ontario, Oregon. I have been secretary of the chamber of commerce over there for the last seven years, and mayor. In appearing in this case I represent the Ontario Commercial Club. The Ontario Commercial Club is an intervener in this proceeding. In connection with my work as secretary of the commercial organization I represent, I have become familiar in a general way with the territory surrounding Ontario and with the irrigation (1555) projects and the production of my section of the country. I have prepared a statement dealing with certain matters here, that I think will partly assist the commission.

853 I have been a resident of Malheur County, Oregon, since June, 1907, and have lived here continuously with the exception of about two years. Since 1921 I have been the secretary of the Ontario Commercial Club and mayor of the city of Ontario.

In 1902 the United States Government commenced surveys to (1556) build what was then called the Malheur irrigation project, covering most of the lands now embraced in the Vale and Owyhee Government irrigation projects which are now under construction. About $75,000 was spent by the Government for investigations and surveys, but due to many different causes and misunderstandings between the Reclamation Service and the land owners, the Government withdrew from the field about 1904. In 1908 another effort was started by the people here to get the Government to build this irrigation project, and a promise was secured from Mr. R. J. Newell, then head of the Reclamation Service, that if 90 per cent of the land owners would sign an agreement to include their lands to take water through Government sources that they would revive the project. Several thousand dollars was raised locally, and after a campaign lasting about a year 95 per cent of the land owners were signed up.

Engineer Paul, who built the Arrow Rock Dam, was sent here with a large force of men to complete the old surveys and prepare reports. During this period hundreds of new settlers came to this country, and practically all of the land under what is known as the Vale and Owyhee projects were homesteaded or taken under desert-land entries. These men settled on these lands on account of this assurance from Mr. Newell that the Government project would be built. Thousands (1557) of dollars were spent by 854 settlers in building homes, fences, drilling wells, and clearing off sage brush from many thousands of acres of land. In order to secure title their families were required to live on these homestead lands for five years.

The Owyhee irrigation district was formed, and good progress was being made when the Trowbridge Niver Bonding Company of Chicago sent in a large force of surveyors and announced that they were prepared to irrigate the lands now covered by the Owyhee project, amounting to approximately 150,000 acres. They stated that the Government was making a failure of irrigation projects, were slow in building, and that private irrigation was more successful, and that the Government should not undertake to build any reclamation projects where private companies desired to do so. Several months later, Secretary Ballinger of the Interior Department, came to Ontario and announced at a public meeting that the Government had no funds to build and would withdraw from this section. The Trowbridge Niver Company then agreed to contract with the land owners to furnish the water for these lands at about $63.00 per acre. Within less than a year the bonding company of Trowbridge and Niver of Chicago failed, and these settlers were left high and dry again.

In 1919 and 1920 the Oregon Legislature and Congress each made an appropriation of $5,000 for making investigations (1558), sur-

veys, and a report on the feasibility and cost of the Owyhee irrigation project. This report was completed in 1921. After a five-year struggle, during which over $20,000 was raised and spent by our local people, the Owyhee and Vale projects were both duly approved.

The Owyhee irrigation project has a net acreage of 139,560 acres, 43,568 having been rejected as nonirrigable, due to
855 being considered too rough, poor soil, or lacking drainage. 80,960 acres is new land, never having been irrigated before; 46,000 acres old land in pumping districts, and 12,000 acres under the Owyhee ditch which receives a partial water right.

The total cost of the Owyhee project is estimated $17,715,000. The estimated number of new settlers needed for the new lands is given as 1,500. Up to date Congress has appropriated $4,315,000, and another appropriation is expected this winter. Work is now under way on the Owyhee Dam and this project should be finished in 4 to 5 years, some units possibly getting water a year earlier.

The Vale irrigation project comprises some 28,350 net acres, and is estimated to cost $3,587,300, of which about 3,570 acres has a partial water right, leaving 24,780 acres of new land. The number of new settlers required is 577. Up to the present time Congress has appropriated $2,100,000 for the construction of the Vale project, and another appropriation is expected this winter. (1559.) Work has been under way for about a year, and the Harper unit and probably all land west of Bully Creek, amounting to approximately 9,000 acres, should be ready for water by the spring of 1930, and the Vale project should be practically completed by the spring of 1931. The above figures are principally taken from the 1925 report of the Department of the Interior, Bureau of Reclamation, reports on the Kittitas, Owyhee, and Vale projects.

The Black Canyon project, located just across the river from Ontario and Malheur County, has some land within three miles of Ontario. I quote the following letter from Mr. R. J. Newell, superintendent of the Black Canyon project, with the following facts about this project:

856 "BOISE, IDAHO, *July 26, 1928.*

"Mr. W. H. DOOLITTLE,
Secretary, Ontario Commercial Club,
Ontario, Oregon.

DEAR MR. DOOLITTLE: "Acknowledging your letter dated July 24 in regard to the Black Canyon district, I am offering the following data:

"The irrigable area of the new lands in the district is about 48,000 acres. The gross area is more than 70,000. The total estimated cost of the project is about $7,000,000 (1560) of which the Black Canyon district's share in the dam and power plant at Black Canyon which has already been expended is about $1,140,000. Your impression as to appropriations available is correct.

Yours very truly,

R. J. NEWELL,
Superintendent."

In my letter to Mr. Newell I stated that I understood that one appropriation of $400,000 and one of $500,000, or a total of $900,000, had recently been made by Congress and was available at this time. He stated that this is correct.

Assuming that the Black Canyon project will need the same amount of settlers per acre as the Vale project, it will require about 980 settlers for this new land.

The estimated cost of the three above projects is approximately $27,000,000, and about 153,740 acres of new land will be added to this particular section. In addition to this, a partial water right will be supplied to over 60,000 acres, which will probably increase
857 the production of these lands 25 per cent. 153,740 acres of new land is a net acreage of carefully selected bench lands of the highest soil capacity, capable of producing as much as the average 200,000 acres now under irrigation in this valley. These lands will require not less than 3,000 (1561) families, and add probably 12,000 people to the population of the county.

The annual report of the commissioner of reclamation for the fiscal year ending June 30, 1926, page 138, says that on 25 irrigation projects the population of the farms is given as 136,872, and that there are 203 towns on these projects, and a population of 365,742 people.

Canyon County and Payette County have, according to the assessment of these two counties, about 179,000 acres under irrigation. Considerable of this land is rather poor quality, due to soil and drainage conditions. Last year these counties shipped about 8,500 cars of produce. So it may be assumed that within a few years the new lands will produce nearly as much tonnage as these two counties do. The addition of about 25,000 new people which will follow the irrigation of these new projects will also result in a considerable additional amount of freight to this section. (1562.)

Q. Right there, Mr. Doolittle, in speaking of the land in Canyon and Payette Counties, where you state that considerable of this land is of a rather poor quality, due to soil and drainage conditions, just what did you have in mind in making that statement?

A. In all Government irrigation projects that were built, like the Boise project, at the time the Boise project was built, it was
858 customary for them 10 or 15 years ago to add all of the land under an irrigation project. In other words, if your ditch covered 100,000 acres it was 100,000 acres and you were expected to pay for the poor land as well as the good land. Under these later changes made since 1922 or '23 the Government carefully goes over each tract or unit of these projects, divides it into 40-acre tracts, goes over each 40, and any land that is rough, any land that is alkali, any land that needs drainage, any land that has poor soil, is put in a non-irrigable class. In many cases there may be only five acres, there may be only 20 acres, there may be 30 acres, there may be any given amount that can be irrigated, or it is possible they might find

a 40 all good, but any land that they don't think can be successfully irrigated, or that will pay these charges, in their judgment, is taken out and put in a non-irrigated class. (1563.) I mean to say that in both Canyon County and in Payette County there is a considerable amount of land along in the bottoms that is under irrigation that is of poor quality; some gumbo, some alkali tracts that are irrigated and produce only normally about half to two-thirds what these bench lands do. In other words, the Government project is practically all bench lands above any previous ditches. The bench lands are in each one of these three projects. All of this new land is practically bench land. It lies above any ditches we now have in the valley. When I say the three projects I mean the Vale, the Owyhee, and the Black Canyon projects.

I am attempting to make clear a comparison between what the old conditions or already developed lands are and what the new will be.

I am attempting to show that the production of these new
859 lands will be 25 per cent, in other words, that is higher than the lands that are generally under irrigation; for some of the lands that are now under irrigation are just as good as any lands, but there is also included among them a lot of very poor lands, in Malheur County and in Payette in Idaho (1564), and in Canyon County.

As to whether I have been active in the development of these irrigation projects throughout their history, or a great part of it, I have been active in connection with principally the Owyhee project. Of course we are mixed up in the Vale project more or less. The Vale project seemed to have good backing. The Owyhee was a project that required to be fought from beginning to end, because the Owyhee was the biggest project ever asked of the United States Government in the way of an appropriation, and the bigger the sum of money asked the harder it had to be fought, and there were other districts in the State of Oregon, as well as many places in the United States, that wanted these funds. So it was a fight from start to finish. At the time the Baker project was under way Umatilla wanted money, the Deschutes wanted money in Oregon, and many other projects, of course, in other places.

It took us over five years to finally pass the United States departments at Washington and secure appropriations from the Government. In other words, we had to pass the test of having all our lands examined, and so forth, and then a final report made, even though we had already received an (1565) appropriation I think of $315,000 from Congress. It had to be approved afterwards again by the Secretary of the Interior. It has been a continual struggle

for over 25 years on our part to get these projects through.
860 We were able in Malheur County, the farmers and the people, to irrigate the lands along the bottoms, because that was possible. But the best land in all the irrigated countries that I know of in the west is the land on the benches above the bottoms. The

alkali and the poor land is always on the bottom. The easiest place of course in the world is to get the water on the bottom, because you can pump it, or you can go up a stream a few miles, 10 or 20 miles or so, and dig a ditch and reach these lands. But to reach lands 100 or 200 feet above the floor of the valley necessitates going back up some stream maybe 30 or 40 miles, building a big reservoir, holding that canal up maybe 250—the Owyhee Canal, as a (1566) matter of fact—Ontario is 2,147 feet, I believe; the canal runs up over 2,450 feet contour back of Ontario; in other words, it started about 2,500, and in the course of 40 or 50 miles the ditch's lowest part is around a 2,450-foot contour, so it is going to water land 300 feet higher than the town of Ontario. To do that required millions of dollars. We spent probably $25,000. Every land owner there that had any land was assessed for several years. It required the efforts of that community year after year to send delegates to Washington. We sent them to Denver; we sent them to Salt Lake; we sent them to Portland; we sent them to Boise many times. We kept a man in Congress every winter, sometimes three and four months at a stretch. We raised $25,000 or more through the various channels that were possible. The Ontario Commercial Club took all of their funds; we went to Boise and raised $500 once there; we went to Payette and raised $300 there; twice in one summer I walked down the streets and asked the merchants for a thousand dollars each time in addition to their regular contributions.

861 We believe our difficulties so far as our irrigation development is concerned are now satisfactorily adjusted so that we may go ahead and fully develop our country. The work is now under way. In order to make our country (1567) successful in the production and marketing of its products we actually have to have new settlers. Now the new settlers will be obtained. There is not any settlement project with us, in this way: The Government put on a price on those lands about one-half or one-tenth. I might say, almost, of what ordinarily and always before lands were considered worth in that country. In other words, they appraised this land at one to fifteen dollars an acre, or five to ten for the appraised land, averaging about $11.00 an acre. They gave the settlers 40 years, or do give them, in which to pay the Government their money back without interest, commencing the first payment in, say, December of the year in which they have an opportunity to get the water in the early spring. This is probably the most wonderful proposition from a settlement standpoint that I have ever heard of since I have been in the West.

I have had over 4,000 letters since last August inquiring about this project. Men are coming in every day, although it will be some time before the lands are watered. But I feel safe in saying that every tract will have somebody ready to farm it when the water is ready. If the water was ready two years from now, one-half the time, we would settle them, because of the fact that there has never

been such a proposition before. The old timers that came here 50
(1568) years ago had to take their families and live five
862 years out in the sagebrush. The old timer and his neighbor had to get together and go up that stream maybe 15 miles and start digging a ditch. It may have taken him in a good many cases three to five years to get that ditch down so as to water his land. He had to provide the bacon for his family during that time.

I recall one old fellow who told me during the period down there that about the only money he saw was when he got a little water from some source there and he hauled a load of beans to Boise, 60 miles away—it took him four days—and he got three cents a pound for them. Now that is what the old settler went through. The new settler—now practically all of that land in under private ownership, but the Government placed a price on it of less than $11.00. All a man has to do to buy a 40-acre tract is to get together that four or five hundred dollars cash to buy it, to go back to town and sit down until the Government announces to him that his water will be ready next spring, and to get busy. He doesn't have to have any money to dig a ditch.

Now in 1912 and in that time there was a bunch of us owned 6,000 acres of land, but before we could start that ditch we had to have $128,000 in cash, because we had to have the money to let the contract, but that money must be in the (1569) bank. It took six or eight months, and we were paying interest all the time before the ditch could be constructed. But to-day the man sits there until the Government tells him that the water is ready. Then in December of that year he is asked to commence paying back. So that he does not require a dollar in cash in advance to get his water, like we did in those days.

Another factor in the settlement of these new lands is this: That
I have made very careful estimates, in connection with the
863 charges for water. We have one 6,000-acre tract there, one of the most attractive in our valley, and I think the settlers under it are the most prosperous. They are paying $9.00 an acre this year for water. I have figured out what the new man will have to pay the Government in this 40-year period, and they will get water for irrigation of their crops for $4.50, one-half of what the man with the pump is. Now the fellows with the pumps are throwing away their pumps. They are asking the Government to come in exactly under the same condition as the new settler, and to pay just as much, because it saves them one-half.

As to whether or not these projects will be promptly settled, it is my judgment that every (1570) piece of land will have an owner, and that practically all of that land will go in at once, for the very good reason that those lands have to start in paying the first season. In other words, if a man does not put his land in he must pay $4.50, or whatever that charge may be, at once, so that will cause each and every man to do so.

As to how the lands in these projects that I have described compare in ability to produce with other irrigation projects of the West with which I am familiar, I think, with the exception of the Yakima Valley and the Wenatchee section, that there is not a district in the West that for diversified farming equals the Snake River Valley. The Snake River Valley from Boise to Weiser has separate and distinct climate from western Idaho, with the exception of the southwestern part. It is 1,500 feet lower than at Ontario, than the Twin Falls section, a longer season, equally as fine lands. So that it gives us a little longer season in there, and a greater oppor-
864 tunity to raise crops of fruit, corn, and such things as that, and a longer alfalfa season. Now I have talked with many men; I have been through the Yakima Valley many times in the past, and I believe in the range of crops grown, in the ability to raise crops, that there are no two sections as near equal in that respect. Yet to give you an idea of what is going to happen in our valley (1571), I am going to say this, and I take in all the region from Boise to Weiser on both sides of the Snake, including Malheur County, and there is probably to-day 600,000 acres of land in that valley. Now in Yakima they show that last year they shipped out over 37,000 cars of agricultural products from 328,000 acres now under irrigation, or about one-half as much land as is now under irrigation in the section covered in what we call the Snake River Valley, roughly from a point 10 miles above Boise to a point 10 miles above Weiser, on both sides and running from Emmett to what we call the main Snake River Valley. There is the junction of six valleys there. In that valley there are some six different streams: There is the Boise, the Weiser, the Payette, the Malheur, and the Owyhee Rivers, and the Snake. They are all there together. Within 15 miles from Ontario the five rivers join and the five valleys come down together, forming the one great valley, the Snake, which averages probably 10 to 20 miles in width and about 80 to 90 in length.

The climate, as a matter of fact, is much better in there than it is in the Yakima section, but the frost season and other things of that kind, there is not much difference. But there is this, that the crops are practically the same and very similar. I have talked with
865 a great many men (1572)—Mr. Van Patton, at Ontario, has a lumber yard at Sunnyside and lives at Ontario, and he thinks that the average of our valley, that is the Snake River Valley, is better than the Yakima. He has a lumber yard at Payette and Weiser. My opinion is that it is equally as good, and that the range of products is practically the same, and that they produce, according to the different reports I have seen, practically about the same amount per acre. The Snake River Valley in Malheur County, which is similar to the rest of it mostly, according to the Oregon Agricultural College survey made in 1925, shows the different districts, five different producing districts for alfalfa in Oregon. That showed that

Umatilla, Deschutes, and Klamath averaged about three tons per acre. The average in the Rogue River Valley district was given as 3.9 tons, while the average in Malheur County around in the Snake River Valley was 5.1 tons.

I brought that fact out to Mr. Ballard, the county club leader, that we claimed to raise more wheat per acre, more corn per acre, more alfalfa per acre, more clover per acre, more clover seed per acre, more potatoes per acre, and more apples per acre in our section than any part of the State of Oregon. He said, "I will tell you something else: The richest soil in the State of Oregon, chemically tested, comes from around Ontario." (1573.)

Now when we talk dairying and such things as that, all we have got to do is to get a good man from the O. A. C. and then listen to him and we might value our lands many times what we do, because our ability to dairy there with eight-dollar hay generally, and
866 blue grass pastures carrying two and a half to three cows per acre, probably almost twice as much as Tillamook carries, makes it a wonderful district for that purpose. There is an explanation, because we use practically 30 inches of irrigation water in our section in June, July, and August, and the total rainfall at Portland, Seattle, and Tacoma for the last 40 years only averages about three inches during those three months. Now it is my judgment this; just one thing more I want to say: Now one reason, there is a great region that has not been known. Why? Because the Union Pacific Railroad, for a great many years before automobiles got so prevalent, and before good roads, which has all happened since '21, you might say, or '22, were prevailing, that people came through our section over the railroad. The railroad through the Boise Valley traverses the bottom lands. Ontario is an alkali hole; at Nyssa, at Parma, at Caldwell, and considerable around Nampa. The bench lands are back a mile or two. The lands in many cases are not under cultivation, like, for instance, between Nyssa and Ontario, a distance of almost 12 miles along (1574) the railroad track, it is mostly greasewood. You can see the alkali. And the people traveling through there on the train wondered how people made a living in that country. Back from the railroad a mile on the benches was thousands of acres of fine orchards, of wonderful lands, but they could not see them. Lately I think the Oregon trail was built, in 1922 or '23, we are getting our system of roads fairly well distributed through there and now people are going through that valley and it has commenced to develop and they are going to see a wonderful development there.

At the present time our territory has very satisfactory
867 railroad transportation eastward, probably northward and to Portland, and to Los Angeles. But we, and the people there, want to get to the coast, to northern California. And when I say to Los Angeles, now I am going to take a little different tact here. If you have sold your goods in Los Angeles the present route is all right, but in the development of every new country there are some things

that are absolutely necessary. I am going to tell you that there are hundreds of people to-day coming from California up in there; I talked to 11, 12, and 15 before I left every day. One little ad of mine brought 2,500 letters from California. They are pouring in there. (1575.) I have been out with those fellows for the last six months, nearly every day with a man from California to show him that country and the things that are possible there. Now when he started out he said to me, "How many times do you cut alfalfa?" I said "Three times." "Well, down in California we cut five or six." "Yes, that is true; but we get more alfalfa in three cuttings than you fellows do in five or six, and it costs a lot more money to cut alfalfa five or six times." Before they left they realized that fact. I have been able to take them out to places, such as McConnell's out there, where his first cutting was 350 tons from 100 acres, the first cutting in June where he got seven ton, and I have even seen eight and nine there in the old days on the new sagebrush lands, because the new sagebrush land produces more alfalfa right from the grass roots during the first 10-year period than they will 15 years from now. Why I don't know, but something is lost from the soil, and they drop back a ton or two from what they will cut from the new sage-
868 brush land. And the Eastern Oregon Land Company of California showed me that for 1918 and 1919—they showed me their statement for two years on a 176-acre ranch they had, where they averaged for the two years 8.1 tons and 7.9 tons, actually what they sold off of that place of the hay. So that those were actual measurements. Many men claim they raise 10 tons there, but I can't verify that. (1576.)

Now these California people are going to be among the settlers there, and I believe in the majority. I might say that I could bring, and that I could get, if necessary, 1,000 letters every month for the next 12 months, if I had one hundred dollars a month to spend for advertising. I used a 13 line ad letter in the San Francisco Examiner, in the Los Angeles Examiner, in the Chicago Tribune and in the Kansas City Star, $100 a month in one Sunday only, every Sunday for four weeks. I had to answer 250 letters a week. I had to quit, because our revenues in that club are about $300 a month, and the advertising and answering those and the postage was costing me $600. It took two stenographers answering the questions those fellows asked me about that country, so I had to cut it down. But I say, all I had to do was to have $100 a month for classified advertising, but I had to have $500 more for stenographers, postage, and things like that. It showed what the people wanted and what they thought of these things. And, as I say, they are pouring into there a family a day, settling at Ontario, four or five coming in, and nine out of ten of these men say, "I am going home and sell out and come back. I have never had a chance like that."
869 Now I am getting down to this point here: These men are going to fill this valley. There is no reason in the world if

Yakima with 328,000 acres of land is producing (1577) 37,000 cars of produce, and when these new projects are finished we will have 700,000 acres or more, possibly 750,000 acres of that valley under irrigation—there is no reason why, if there is a market for it, that those men can't there produce 75,000 cars. And the point is that we don't know where we would sell it or ship it, and we don't know whether we will produce 75,000 cars, like Yakima, because the question is, where will we market it? And that brings us up to this matter of marketing. They say that the trade follows the flag. Marketing will follow this railroad. The fellow that comes from California—and I have had lots of them say, "Those are fine apples you have got," and things of this kind. "Yes." "Why don't you market it down our way? We get the same kind of apples. We think there ought to be a good market down there." Why these men see our fine potatoes and they say, "Gee whiz, why not ship some of these down in our town?" Now what is going to happen is this: The other day I saw where a man bought, I think it was 18 cows, up at Emmett, 30 miles from Ontario, for shipment to California, paid $125 for Holsteins. Californians come in there to buy cows; they come in to buy this and they come in to buy that, but the effect of the fact is this: Whenever you bring in a man and sell him a (1578–88) piece of land, he comes to a new country; he brings four or five or six or 10 or 20 families from the same neighborhood. He writes his friends, "This is a great opportunity so and so," and brings others.

870 I can remember one time a great many years ago at Spokane there where we brought 27 families from a town that only had 32, when we got the two leaders. I know that around Ontario there are probably 25 families that were closely connected with the same point in Iowa, because some one or two fellows came from there. Now those men are marketing agents for a railroad. They think of the things in their country that their country needs and the opportunities there. There comes an inquiry, "Can we get cows there?" "Can we get good fruit?" "Can we get this, or something else there?" The result of the thing is—and this is one of the reasons why we want this short line outlet—and the other way, we can't go by the other over to Salt Lake, over the Clark Road, down through that desert. Everybody here has the same products we have. We want to go where people come from. California is filling up with people; it is going to continue for many years; and the coast is going to continue for many years; and we want to go in, because we can't do business unless we have people to do business with.

Q. Will this cross-State line as proposed in this case be the outlet you want to the coast? (1589.)

A. The people in my country tell me this: There are two main reasons why they want this. The first is this: The stockmen, shippers, and things of that kind, they say, "We want this road out here because of this; we will ship in preference to any other route

over here the great amount of our stock, because we might want to divert to another market in case the Portland or Seattle market is not good or glutted, and the fact of shipping our stock over here will give us a better price, as a rule, because there will be
871 competition." The other one is this—that we all feel that in shipping over this route, it gives us an opportunity to get more business. Now if you had sold your stuff in Los Angeles it would not make any difference; you could ship over this road here; but suppose you wanted to stop your stuff at Visalia, suppose you wanted to stop it at Bakersfield or suppose you wanted to stop it at Sacramento, you might want to do business at all of those towns, and that is one of the main reasons we want to get over into California, or into San Francisco, because it is a shorter distance and because it is going through a country where there are people to do business with, and those are the essentials. (1590.)

I have never examined Mr. Teutsch's Exhibit No. 1. Can anybody tell me what the basis of this is; what I mean is, what proportion of this stock and potatoes and things of that kind—is there any basis for it?

From my knowledge of the movement of products from Malheur County and the Snake River Valley which is adjacent thereto, it is my opinion that there would be products in considerable quantities that would move into the western market from San Francisco northward over the proposed cross-State line, if it were built. (1591.)

I think there are probably small movements of poultry and some things perhaps to San Francisco. I don't know just to what extent that movement is at this time. As far as I know, everything that is routed is either by Portland or by Ogden and thence to San Francisco over that route. There is no question in my mind but that the construction of the cross-State line would stimulate a movement of produce into the San Francisco and bay area. It is a shorter route, and then, as I say, the possibilities of other business. If
872 the market conditions in San Francisco are as good as Los Angeles, there is no question but what a lot of this stuff will take that route.

As to whether, in shipping into that market under present conditions, we have to go through territory producing the same produce and go into markets in competition with such territory, I mean this—that in a general way, we will say, in the first place, if you were shipping stock to San Francisco (1592) and the distance was 1,200 miles one way, or was approximately 350 or 400 miles shorter the other way, and if you could go through on one feed, you would naturally select such a route as that in order to avoid shrinkage and things of that kind. That would be the natural thing to do, because it would save time and shrinkage.

Cross-examination:

I am looking some to western Oregon for markets of the produce of the Snake River Valley. I think in the future there will be more

of it. Now we will get right down to this: I notice in Yakima Valley they shipped last year 7,300 cars of alfalfa products, and from what I know, having lived in Tacoma six years, I know that over on the other side a great deal of alfalfa comes over from there, because my mother has bought alfalfa at Lakeview, about seven miles from Tacoma, in the past. So that, from what I know of western Oregon and what I have read in connection with dairy matters, and things of that kind, I would think that reasonably we ought to have a good market for it. If the dairymen of the Sound country, of Puyallup Valley and up in through there, and the Seattle section and all through there, can afford to buy alfalfa
873 for their hay, why, they can in western Oregon. (1593.) I think western Washington is limited to the Yakima country for their alfalfa products. The only alfalfa production which they have available, except such as they raise in western Washington, is the Yakima Valley. In western Oregon they can draw on Klamath or the Rogue River country for alfalfa; they can draw on Bend, Redmond, and the Deschutes country; they can draw on Hermiston and the Umatilla project; they can draw on Union County, or even Baker; or they can draw on Walla Walla or Yakima. But here is a fact, Mr. Spencer: In most of those sections you have mentioned, with the exception of the Yakima Valley, the production is not so extensive but what perhaps they will dairy and use that up in the shape of feeding cattle, for dairy feeding, and things like that, in districts like the Rogue River, because they are very limited. (1594.) But here is a situation you are going to face in our country in a very brief time. You are going to have 150,000 acres come under production as soon as these Government projects will be finished. The Vale will be finished in a couple of years or so, and Owyhee in five, and the Black Canyon, from all reports, because they have $900,000 available for a second dam and it will only take two million to build. We are urging it for power reasons. We have already spent nearly two million dollars on that Emmett Dam—I attended a celebration there a few years ago—and we now have about 40 or 50 per cent—when we start in with new lands—now I will give you an idea: I own all the law will allow me of lands down there; I am going to put that under irrigation. What is my crop going to be? If I get that water in the spring of the year it will all go into wheat, probably produce 30 bushels or more, and in August
874 of that year it will all be seeded to clover or alfalfa as a starter crop following the wheat. Now I will put it that 50 per cent of that land is going into alfalfa and clover, half probably alfalfa. I will say to you that new land produces more than the old. It will probably average six tons within a year or two. Now you have got 75,000 acres. If you take half of that at 6 tons it will be 450,000; call it three, 175,000 tons of hay there. It will take more eventually, as it gets older and (1595) older we will use up more alfalfa and we will have less to go on the outside, because

we will raise more of other crops, but on the jump there it is going to show a tonnage of three or four hundred thousand tons of hay. Probably we will be glad to export for several years, maybe the next seven or eight or 10 years, 150,000 tons a year. If not, we will find some way to handle it. But there is the situation for you.

Yakima is credited, according to this statement I have here, with $12.50 and $15 for that hay, and that they shipped about 13 tons to the car. But the alfalfa put in meal form, they shipped in alfalfa meal last year 300 cars, value $500, and while they were figuring the value of the other at approximately 185 or 200 they must have either got a lot more or got a bigger price.

There are three things essential for a dairyman to do, and they are not doing it in the Willamette Valley today: First, have good cows; second, he has got to feed the cows if he makes a profit; third is management. Now in Wisconsin, in California, and these other sections where they are dairying, they have to pay $15.00 to $20.00 a ton for good hay, and they could pay more here.

Q. But they raise it in western Oregon, don't they, about 850,000 tons? (1596.)

875 A. I understand, and I notice that your college has that up constantly, that they don't raise, don't produce. I saw a statement that in a single county there was over 30,000 tons needed in that county just recently. There was a statement made just recently that they should be producing 30,000 tons more of alfalfa or clover, and also claiming there was 30,000 tons in that one county more succulent feed. So it shows they don't.

Western Oregon, in a gradual way, may absorb some other things here. It is possible there will be an interchange of cattle, and it may be some sheep, and things of that kind. I think, generally speaking, western Oregon will go in, and will want more dairy feeds from us of various kinds. Now we might ship corn. Now there is a proposition I have taken up myself. I got a sample of ordinary corn, taken from Charlie Emerson's place two miles from Ontario, and sent it on. All right; they wrote back to me and said they wanted their chemist to test it, I suppose for flour and things. I have that letter here; I could read it if necessary; that the corn there equaled the corn they get from Nebraska and Iowa. We have a demand for corn in southern Idaho. (1597.) But I am telling about this. The fact of the matter is, we haven't got it down to the matter of raising comercial corn, which we could do. We could raise three million, four million or five million bushels, if we wanted to, because, I see where the production of Iowa as an average proposition was 39 bushels, and yet our county agriculturist gives you 59.7. I can show you a letter I received from a good Holland farmer there that in 1925 he had 11½ acres of corn that produced 115 bushels per acre. Everybody knows him, Pete

876 Tensen. Everybody knows he is perfectly reliable in that country. The same letter said his boy had either six or eight

acres in Early Bliss potatoes that averaged 325 sacks. Now that is practically a carload—330 is a carload, I believe, to the acre.

Now the same way with this corn. We had a corn contest in Ontario in 1914; we started in the month of June. Not an acre of land under that was fertilized, because in those days we thought none of our land would ever require fertilizer, but it was old alfalfa ground plowed up and put in potatoes. There were eight out of those 20 men—we started this contest, and in July we put up a prize and nobody knew it, and there were eight men had 120 to 130 bushels of corn to the acre. So it gives you an idea.

Now our condition (1598)—we will have to do some things we don't do now. We will have to put in corn cribs, we will have to be able to take our water off a little earlier than some of these fellows do, and we will have to use better methods. But I don't know a reason in the world why that valley should not have an outlet to this coast, even California, for our corn and all of our products. I talked to Colonel Patch, who I believe comes from Iowa, that runs the cannery at Payette. I was talking to him about the corn proposition. He said the Snake River Valley is the only region west of the Rocky Mountains that can produce good corn. I said, "Do you think it is as good as in Iowa?" He said, "Yes." We have been growing corn there, that I know of particularly, since 1910. It is true they are shipping corn into southern Idaho, because the fellows don't put that corn up in shape, because they find a little market there at home for it; and we have so many other products that sometimes may be more of a cash crop. But speaking about that very thing, I
877 am going to give you a little illustration. I figured with Mr.
(1599) E. M. Greig three or four years ago. He had 55 acres that produced 60 bushels of wheat, and he had 23 acres that produced 72 bushels of corn, and he sat down to figure which was the most profitable, and when we got through we found with the 72 bushels of corn against the 62 bushels of wheat there was more money in the corn, and it took one and one-half as much cash on the part of the farmer to raise it because it only takes 12 pounds of corn to seed an acre and we generally put in two and a quarter bushels of wheat to the acre to seed it, and there was the sacks, the threshing, and all that, while the men who raised the corn went out in the fall of the year when he had plenty of time and husked that and took care of it. So that he actually did most of the work himself and wasn't out a lot of cash. But we found as a matter of actual net returns that the 72 bushels of corn were more profitable than the 60 bushels of wheat. It is only a question of education, a matter of a few months or a year or two. But why we haven't done it is because this fellow puts in 10 or 20 or 30 acres of corn, or maybe he puts in 50, and some sheep man comes along sometimes and rents five acres for pasture after the corn has been taken off of the stalks and pays five, six, or seven dollars an acre, turns in a bunch of sheep in there, and as long as they can handle it that way they won't bother

with shipping it. But what are they going to do when they have 10 times that much, or when they can start in to make it a commercial (1600) proposition?

Los Angeles has more population, more consuming capacity than the whole State of Oregon; but also has Frisco and
878 Oakland and the bay district. They have got a lot of valleys back of them and they draw on Nevada, Oregon, and Utah. They draw from Montana and many points; and that is one reason why with a shorter line they would draw from here more extensively. We ought to be able to supply stock. Montana is shooting through their stock with a clip at San Francisco, and Texas and such States; they are sending their stuff in, and there is no reason why there should not be a market for part of our potatoes in California. Yakima ships I think 700 or 800 cars. Our region don't ship anything like that, and there is no better potato than ours—we could raise 10 times as many, and it is reasonable to suppose when we cut down the distance to about 800 miles to San Francisco and the bay district it will be done. And when we get these Californians a little better acquainted with our territory each one will be telling every one else all through California that they can get a car of potatoes in Ontario, or up in there, for (1601) such and such a price, and we will be shipping more and more all the time. You will find your markets doubled up and trebled. The production doesn't double up our markets. I am talking about the market. I mean this: I mean these very men that will come from California, and those things, spread the gospel where you can export produce at a certain price. I have known an apple raiser to take a car back to Nebraska and sell it, or to take it to some town they came from in Kansas and sell it, or in Texas. That is the way you build up traffic.

Generally speaking, the Twin Falls country is as productive as our country. I think along the line of crops. I don't think
879 they raise the same crops we do. They won't raise corn in comparison, because we have a longer season. They raise a large volume; and fine quality of potatoes. They raise enough beans to feed the entire coast, I guess. (1602.) They raise alfalfa; and if they were shipping it to western Oregon, I have a suggestion: We might have a market for some in northern California. But I haven't suggested alfalfa into San Francisco. It may be possible that we will find a market there for it.

Q. But I am wondering if Twin Falls doesn't ship any great volume into central California how you can expect to do it?

A. Well, we are simply like the process of all of those things. When you are within a certain distance and can get down there with it, all you have to do is to scrap with the other fellow a little.

The short line does not come over into the Ontario section to any extent with their literature and so on. I will say they haven't I have had quite a dispute with the short line in that way. They have some ideas and I have another. Now I will give you an idea.

Sometimes it is not always their fault; I don't want to say anything mean about the short line, or anything, but I will tell you, sometimes they don't see with the vision the same as anybody else. I have been 40 years connected with movements in developing. We went to Spokane in 1878 when I was 9 years old, five years before it was on a railroad, and I have been on the path ever since. When I came down to this valley, as an illustration of what I mean by vision in advertising, let me tell you this. (1603.) (At Yakima, Wenatchee, Hood River on the O.-W. R. & N., and at The Dalles and La Grande
880 were fruit stations, fruit displays. I came down here in 1907 and orchards were selling at two or three thousand dollars an acre at Wenatchee and Yakima, and the world was full of men hunting for orchards and looking for such things. Over across the river at Payette I saw the most beautiful orchard I ever saw, and hundreds of acres in there, so the next year or two after that I organized, or tried to organize a movement down there, and I asked the short line for permission to put a fruit station—I got the fellows interested at Boise, at Nampa, at Caldwell, at Parma, at Ontario, Weiser, and Payette. I said, "If a gentleman coming through this territory sees one fruit stand he will be interested, but if he sees seven he will know it is a real apple country." I had a picture drawn, with a beautiful glass building, to put on the track, and things of that kind, but I could not get permission. I don't know why they didn't want them; they thought maybe it would spoil the looks of the station grounds, or so and so, and I didn't get them. But here was the logic of the thing: They were hauling people through, as I explained to the officials, clear to Yakima Valley to buy fruit orchards, or some other point, where the Union Pacific didn't have any railroad. They were hauling them up to the Wenatchee country where the Great Northern controlled it, or in those days I think the Northern Pacific generally controlled the (1604) Yakima, where we could have sold them in that valley if they had known all of these things. But they could not see it from the tracks, those orchards lying down in the alkali bed, and there was the best chance in the world for doing something with those hundreds of fellows coming through every day hunting for good orchards. But that was their policy.

881 Now, I took up with Mr. Smith, of Omaha, here some time ago, the advertising of our district. I said to them, "Gentlemen, I don't know how much experience you have had, but," I said, "I want to tell you this: The time to advertise this country is now, before we get the water, for the reason you will get it settled up with a better class of men if you start now than if you wait, as you say, until the water is ready and then put out advertisements, because you get Tom, Dick, and Harry. If you wait until the water is ready, here comes a fellow with $500 cash and that is all he has got. All right; it takes $500 cash to buy one of these tracts and one of these permits. He thinks he will get by some way if he buys that, and he goes out and buys it with just a little cash and

hasn't anything left to do anything with." Now I said, "You start your advertisements now and what will happen? Here will come a few letters from the type of fellow who has got only $300 or $400 or $500. You write him and tell him it will take all of that (1605) cash, and what happens? He forgets you. He needs that money to live on, and he is gone. But here is the fellow with $4,000 or $5,000; he sees that ad and he inquires about it. You go on to tell him these lands are appraised at about a fifth of their value; that these lands when in alfalfa will yield them enough to pay 6 per cent on $200 an acre and it won't cost more than $20.00 or $25.00 to get it into alfalfa, and that these payments are about half what our men are paying now on irrigation. He will say, 'That looks pretty good. I have got a boy growing up; I will just go out and look at it.' So he comes out." And, as I said before, there never was a
882 proposition put up like this before. Now he buys 60 or 80. He is a man that has got money; he has saved money; he is a fellow who has always put away a little, and he is the type of man who will have that money all ready by the time that water is ready, and what will he do? He will tell some of his relatives and friends, and what is the result going to be? In two or three years from now you can't buy a piece of land for love or money. That is what is going to happen.

Q. Is the Oregon Short Line advertising these projects so people will be informed of these opportunities? (1606.)

A. Not that I know of. I have got in enough jangles anyway. I will say this: I have received during the last 10 years about 10 letters from the short line department at Salt Lake. At least five or six of these fellows were fellows who had already written me, or they went back to the department to find out if I was lying, or telling the truth about it, to get more evidence.

Like a great many other things in connection with salesmen, the market is open for all of us. Now we will do some business with San Francisco. We will ship in and we will be shipping butter in there, we will be shipping poultry in there, probably this and that commodity, and on the same terms as the Twin Falls. To-day Twin Falls has several hundred miles (1607) the best of us.

Q. They are not competing with you in so far as selling in that country, are they?

A. I don't know. I don't know much about Twin Falls, how much they are putting into the San Francisco market.

The Utah Valley is some valley as a producer, near Ogden. It is true to a certain extent they raise the same products we do.

Q. And they are only 790 odd miles to San Francisco from Ogden. Now if they don't do any business with the bay district compared with what you do with Los Angeles, isn't there some reason other than the matter of salesmanship?

883 A. Well, aren't they all doing business? Isn't Utah doing business? Don't you pick up the Los Angeles paper and it

shows they are putting sheep, maybe, or cattle from Montana, from Nebraska, from Texas, as well as Utah and Arizona, and up here to Oregon and other places? Isn't it a question that we are all of us competing together in that market? Isn't it a question they are increasing there every day; that San Francisco is requiring more and (1608) more stuff, jumping by leaps and bounds? Have they reached the point that the California market would not supply it? Should we sit off to one side and make no effort to get in there, let the other fellow get it all, because he lives in Twin Falls and Utah?

Q. If the construction of a line to take Twin Falls into San Francisco with its produce has been a disappointment and failure to date, shouldn't we wait and see whether they can do some business before we build another one across the desert of Oregon to try to let you experiment with it?

A. I thought we were going to try to show you that it wasn't a failure. You say the Rogerson-Wells road is not used extensively. Maybe there are reasons for that. I don't know very much about it. Do you have trains over it every day, or once a week, or do you make them any better rates? Of course Twin Falls logically should ship over that road.

Q. They can ship whole trains of poultry or perishables; we give you any ten cars of special service. I am speaking about Twin Falls.

A. We know naturally with our shipments, with a road across (1609) this way, we will get into San Francisco shorter. We don't think we should be condemned in the development of the Owyhee project, when we are going to add 10,000 carloads to your
884 freight. We think we ought to be helped to get into these markets as reasonably as anybody else and by a shorter route. That is the way we feel about it. So we can compete, and we feel that we want to go through territory where there is business that can be built up.

Q. Ontario is 30 miles shorter by the Wells junction.

A. You go practically to Minidoka and go back to Twin Falls, and maybe the train is made up the next day or two. I don't know. There are a good many different features in there. It is 1,025 miles from San Francisco to Ontario by the Wells cut-off.

I was a witness in the first cross-State line case tried here in this building four years ago, in '23. (1610.) I testified then we were not permitted to ship out alfalfa hay because of the weevil. We are still under quarantine. I would like to say in regard to the quarantine for alfalfa weevil, that we did have, in 1920, the weevil, and I remember one particular field of alfalfa that I think it was in 1919 cut 1,000 tons and it dropped to 400 in 1920, and in 1921 and 1922 we were badly afflicted with the weevil. About there, or somewhere along in '22 or '23 we brought in a parasite and about that time it was resolved that spraying our alfalfa was the only method of checking the weevil. Mr. Reeves came there from Salt Lake, a Government entymologist, and Mr. Wickland

from Parma, and we had an airplane spraying the field. We discovered to our surprise that the men gathered up five weevils and three of them had this parasite in them. (1611.)

I heard the previous testimony given here about the weevil—eradication over in that country. We haven't noticed the weevil for three years there I think to-day. I want to say I think '25 was the last weevil I ever got my eye on. I went out with a
885 bunch of men to see if we had any weevil. We hunted around two or three stacks, and about made up our minds there wasn't any such thing as a weevil in the country, when under one stack we discovered two down under the bottom of the stack after careful search. That was in '25. There has been less and less. I don't know how you can tell from the class of crop there is not any weevil in the country. I don't think there is any weevil possible at all there. Now once in a while something might have escaped. But here is the situation, so far as the weevil is concerned: There is no difference, and the weevil to-day is not any worse than any other little bug, because you have a sure cure, and he has cured it. So far as the quarantine is concerned, Mr. Martin, of (1612) San Francisco, asked me last year "Why don't you have that quarantine removed?" I said, "We are too busy about other things. We are not shipping hay. We will some day and we will see that it is removed." There is talk where two men meet on the road, where it has been 4 or 5 years, that the weevil comes in the county; if it comes in it moves from one place to the other and moves around. But we haven't got it now. You might have had the smallpox 5 years ago and got over it. That is the situation to-day as we regard it. (1613.) There have been no steps taken to remove the quarantine. I think the county agent has brought it up with Mr. Weatherspoon, who is a member of the State Board of Horticulture. He was down there some time ago and said he was going to propose to the board to take it off, to remove it. That is what the county agent told me.

886 LEONARD E. GILKEY was thereupon produced as a witness on behalf of complainants, and, having been duly sworn, testified as follows:

Direct examination:

I reside at Albany. Albany is the county seat of Linn County in the Willamette Valley. (1614.) I am secretary of the Albany Chamber of Commerce. I have held that position four years. Prior to that time I was engaged in farming in Linn County for 14 years. I believe I am familiar with the resources of Linn County, and particularly with its agricultural resources. Preparing to testify in this case, I have made a rather cursory investigation of the tonnage that is shipped out of Linn County eastward bound. I secured that information from the different buying and shipping agencies of the county; and also I worked somewhat in conjunction with Mr.

Teutsch when he was securing this agricultural information for the public service commission.

As to whether I am familiar with the Linn County figures included in Mr. Teutsch's report, Exhibit 1 (1615), I have never seen that exhibit. I perhaps should not have said I assisted Mr. Teutsch. I gave him what information I had and check up for him on a few of our industries there. In a way I did assist. In addition to that I made some independent investigation of my own. I would say that Mr. Teutsch's estimate of a total of 324 cars of present agricultural tonnage available for movement over the proposed cross-State railroad is a conservative estimate. I would say his suggestion of a potential tonnage of 59 tons in addition to the 324 to be available within the next 5 years was very conservative also.

887 I have prepared, in exhibit form, the information I collected showing actual movement of tonnage at the present time. It is the sheet I have before me. (1616.)

(The statement so offered and received was thereupon marked "complainant's Exhibit No. 25, Witness Gilkey.") (1617.)

This exhibit shows practically what Professor Teutsch's exhibit shows here, with the addition, I see, of tonnage and carloads of eggs that were shipped out of Linn County last year.

Q. Does this include all of the tonnage shipped from Linn County, or merely the proportion which you estimate would move or might move over the cross-State line?

A. Well, I wouldn't say over the cross-State line, but shipments to all points of the United States lying east. I didn't follow these different carload shipments to their destinations. In addition to the agricultural tonnage which I have checked over with Mr. Teutsch, I went into the present eastbound lumber tonnage out of Linn County, which is our great export tonnage. As to the lumber movement, I found that last year, checking through the railroad agencies, freight agencies, that there went out of Linn County, from Albany and Mill City, 8,640 cars of lumber, eastward bound. (1618.) Practically all of that lumber was Douglas fir. In addition to that I understand there was a substantial movement to California and other destinations.

Mill City is on the extreme Northern boundary of the county, northeast of Albany. It is served by the Southern Pacific, by a branch that was the Corvallis & Eastern. Those shipments move entirely through Albany.

888 Toledo is west of Albany, on the coast. To reach the main line of the Southern Pacific and go over the Great Northern or Northern Pacific through the Oregon Electric the lumber shipments would come through Albany from Toledo.

Q. Do the rail lumber shipments from Toledo pass through Albany at the present time? (1619.)

A. I presume I may be wrong on that. There is a west side Southern Pacific road that I am not familiar with as to the traffic

on that. I presume that would go over the west side. It is possible that they wouldn't come through Albany. I included it because I understood that there had been no check on the traffic eastbound out of Lincoln County. I took it upon myself to secure that information. In addition to the rail shipment from Toledo I believe there is also a large production which moves out by water.

My figure of 30 billion feet of marketable timber includes Federal reserve timber as well as privately owned.

Q. To what extent is the timber of Linn County being milled at the present time? Is it being milled in any substantial quantities?

A. In comparison to the amount of timber that we have it isn't. We have about 20 more mills of small capacity (1620) operating within the county, and the large Hammond Lumber Company mill at Mill City. The small mills I refer to are generally referred to as tie mills. They are just simply operating on the outskirts of our great timber supply. The mill at Mill City is the largest mill in the county. I do not know the capacity of it. It isn't as large as the Toledo Mill.

Q. Have you any information as to whether the timber stand which you have shown is mature and ready to be marketed?

889 A. The estimate by the cruisers who have worked in that district—I am quating particularly the cruiser employed by the county; Linn County is making, and has been making for the past two years, a cruise of all the timber in the county, and I am using his estimated on that, and I understand that is the way they check on it.

As to the interest of Albany and Linn County as a whole in the proposed cross-State line, I might say that that interest is just general. I might further explain that by the fact that we (1621) believe that the element of development of the State of Oregon will depend upon additional east and west transportation facilities, and while I question that the cross-State road, with its western terminus at Crescent, would be of any very material benefit to us, yet we are interested from a safe standpoint. As I stated, our interest is of a more general nature with the western terminus of that road at Crescent. We are, however, vitally interested should the cross-State railroad be built in an extension, or feeder, whatever you might call it, of that line from somewhere, some connection in eastern Oregon, preferably at Bend, westward over the Hogg Pass show a connection with the Southern Pacific line at Detroit or a connection with the Oregon Electric's proposed extension at Cascadia, in Linn County. We believe that that would be a very material benefit to Albany and Linn County. We feel that later development would be advanced or hastened by the construction of the cross-State line. Aside from that our interest is in the general development of the State. (1622.)

As comparable with our entire output our agricultural products tonnage eastward bound, I would say, is comparatively small.

890 A great deal of our products find a market either north or south. Our apples and pears, if you will notice on the
